

# **Fisheries and Optimal Eutrophication Management: A Bayesian Approach**

**“Pragmatic Approach for Cost-Effectiveness and Cost-Benefit Analyses for the Marine Strategy Framework Directive”**

**Soile Oinonen, Heikki Peltonen, Outi Heikinheimo, Laura Uusitalo & Marko Lindroos**

The Seventeenth International Conference of the International Institute of Fisheries Economics & Trade (IIFET)

*Towards Ecosystem Based Management of Fisheries:  
What Role can Economics Play*

Queensland University of Technology (QUT), Brisbane, Australia

7-11 July 2014

## Outline

- Introduction to the Marine Strategy Framework Directive (MSFD)
  - Good Environmental Status (GES) & 11 descriptors
  - Economic analyses of the management measures
- Introduction to Bayesian Nets
- Step-by-step approach for CEA & CBA using Bayesian Nets
- Eutrophication & biomanipulation

# Marine Strategy Framework Directive (MSFD)

- Objective: Good Environmental Status (GES) by 2020

- Initial Assessment
- Monitoring Programme
- Programmes of measures

- 11 GES descriptors

- Biodiversity, non-indigenous species, food webs, commercial fish, eutrophication, sea floor integrity, hydrographical conditions, contaminants, contaminants in seafood, marine litter, energy including underwater noise

## Economic analyses of the programmes of measures

- ”...Member States shall give due consideration to sustainable development and in particular, to the social and economic impacts of the measures envisaged...ensure that measures are cost-effective and technically feasible, and shall carry out impact assessments including cost-benefit analysis, prior to the introduction of any new measure.”
  - Member states do not have such tools (marine ecosystem model coupled with an economic model) that would allow cost-effectiveness analysis with respect to 11 GES descriptors
  - Pragmatic approach that is able to handle quantitative and qualitative data and expert knowledge needed
    - **Bayesian Net**

## Development of programmes of measures in Finland

- Gap analysis: how far towards GES we can get with the present set of management measures?
- Propose new management measures and analyse their cost-effectiveness
- Separate working groups develop a list of new management measure for each descriptor
- Working group of economists run the CEA&CBA
  - Quantitative information on the impact of the measures needed
    - Existing models only for one descriptor (eutrophication)
  - Estimate on costs (financial + economic costs) needed

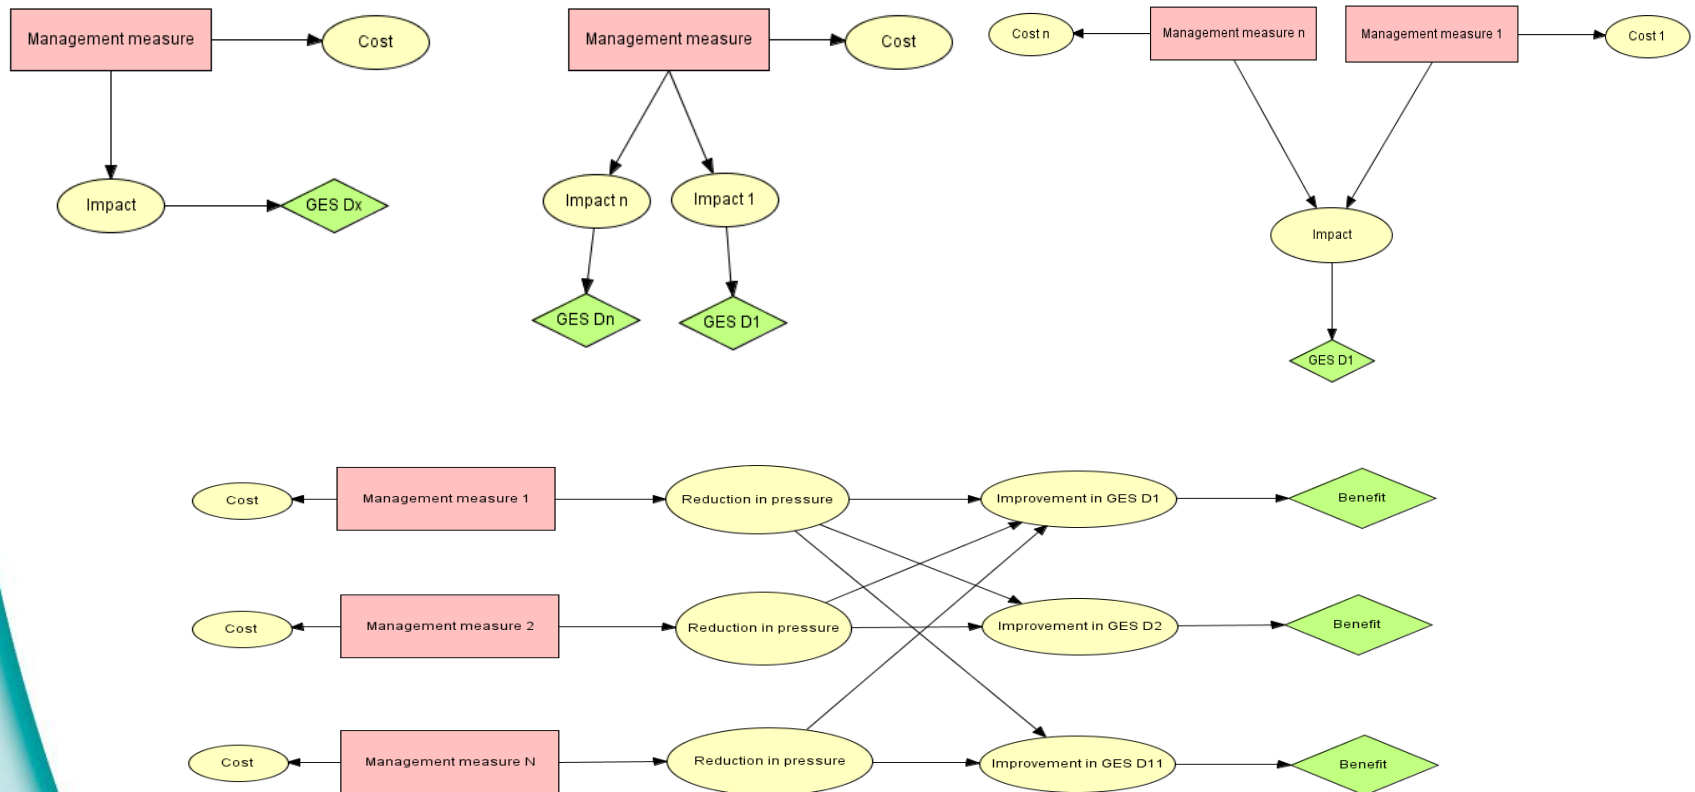

# Bayesian Net

- Graphically presented mathematical models
- Directed acyclic graph denoting (in)dependencies between the model variable's
- Conditional probability tables denoting the strenght of the links between the variables
- Optimisation possible using decision variables and objective functions

# Step by step approach for CEA & CBA using BN

1. 1 measure & 1 descriptor
2. 1 measure & all descriptors
3. All measures & 1 descriptor
4. Full CEA&CBA

# Data collection: Effectiveness of a management measure

Impact	Probability										
	D1 Biodiversity	D2 Non-indigenous species	D3 Commercial fish & shellfish	D4 Food webs	D5 Eutrophication	D6 Sea-floor integrity	D7 Hydrographic conditions	D8 Contaminants	D9 Contaminants in seafood	D10 Marine Litter	D11 Energy including underwater noise
No impact	0.1428571		0.2	0	0						
Closes <10 % of the gap	0.1428571		0.8	1	0.05						
Closes 10-25 % of the gap	0.1428571		0	0	0.2						
Closes 25-50 % of the gap	0.1428571		0	0	0.5						
Closes 50-75 % of the gap	0.1428571		0	0	0.15						
Closes 75-100 % of the gap	0.1428571		0	0	0.1						
Good Environmental Status	0.1428571		0	0	0						
<b>Sum of probabilities (=1)</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>1</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>

Impact: probability of closing the gap between the present state and the GES

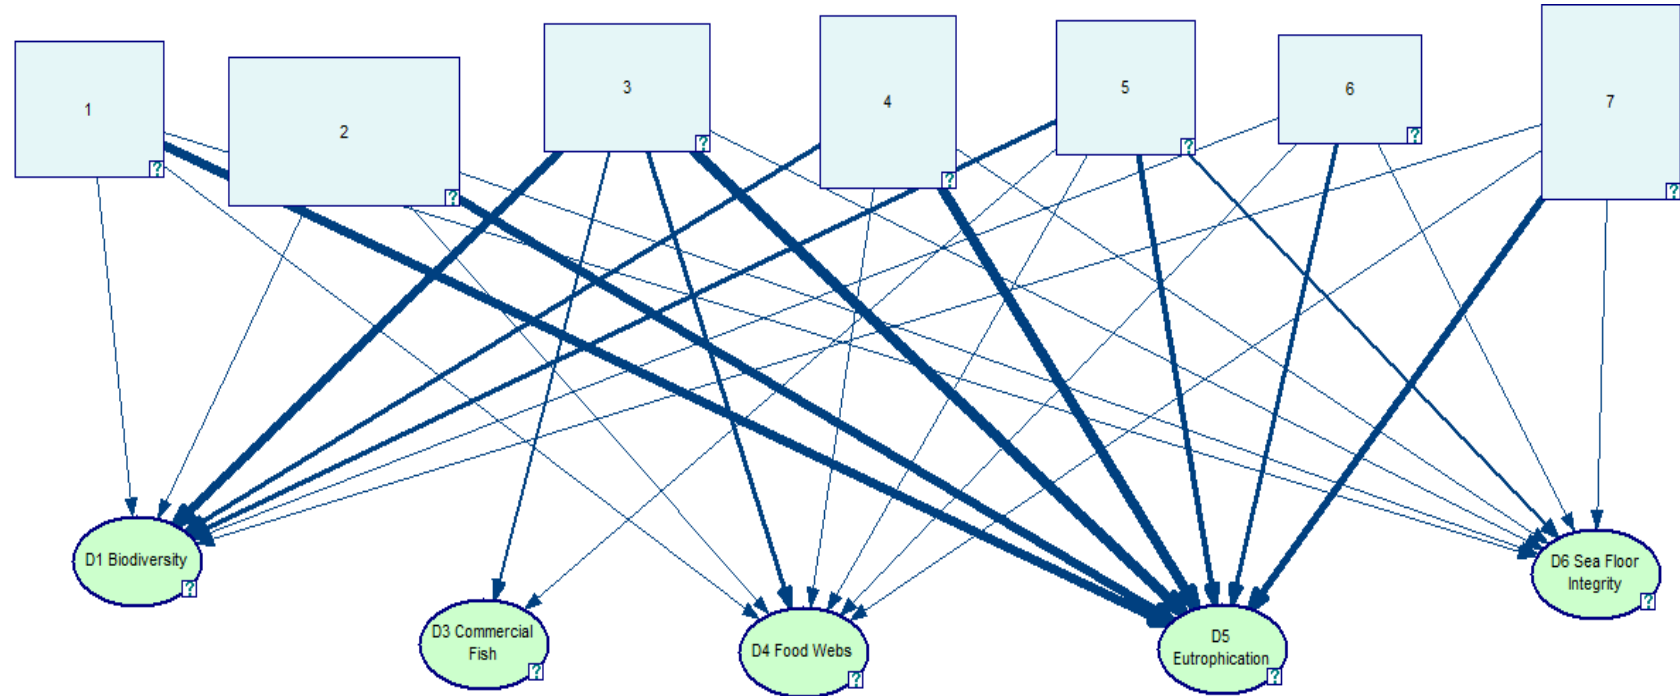

- Models, literature, expert opinion: probability is the common language

## Combining expert judgements

- Expected value of the expert's view
- Commonly agreed distribution between a group of experts
- Experts provide their opinion for each measure separately
  - Measures impact is independent
    - Interaction using a modelling technique available in the BN softwares (Noisy-Max-gate)

# Effectiveness analysis

Strength of influence of 7 measures on 5 GES descriptors using GeNIe software

# Effectiveness analysis

## Measure 1

## Measures 1+2

## Measures 1+2+3

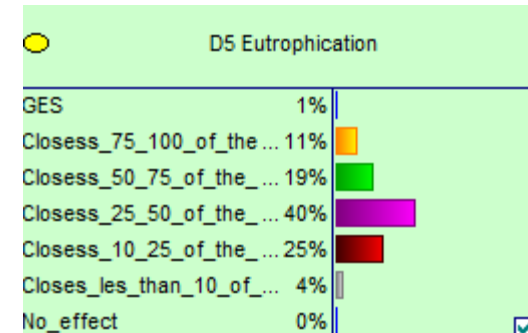

## Measures 1+2+3+4

## Measures 1+2+3+4+5

## Measures 1+2+3+4+5+7

# Data collection: costs of management measures?

Total costs of the management measure in years 2016-2021	Probabillity
< 0,1 milj. €	0
0,1 - 0,5 milj. €	0.2
0,5 - 1 milj. €	0.2
1 -5 milj. €	0.3
5 -10 milj. €	0.3
10 - 50 milj. €	0
> 50 milj. €	0
Sum of probabilities =1	1

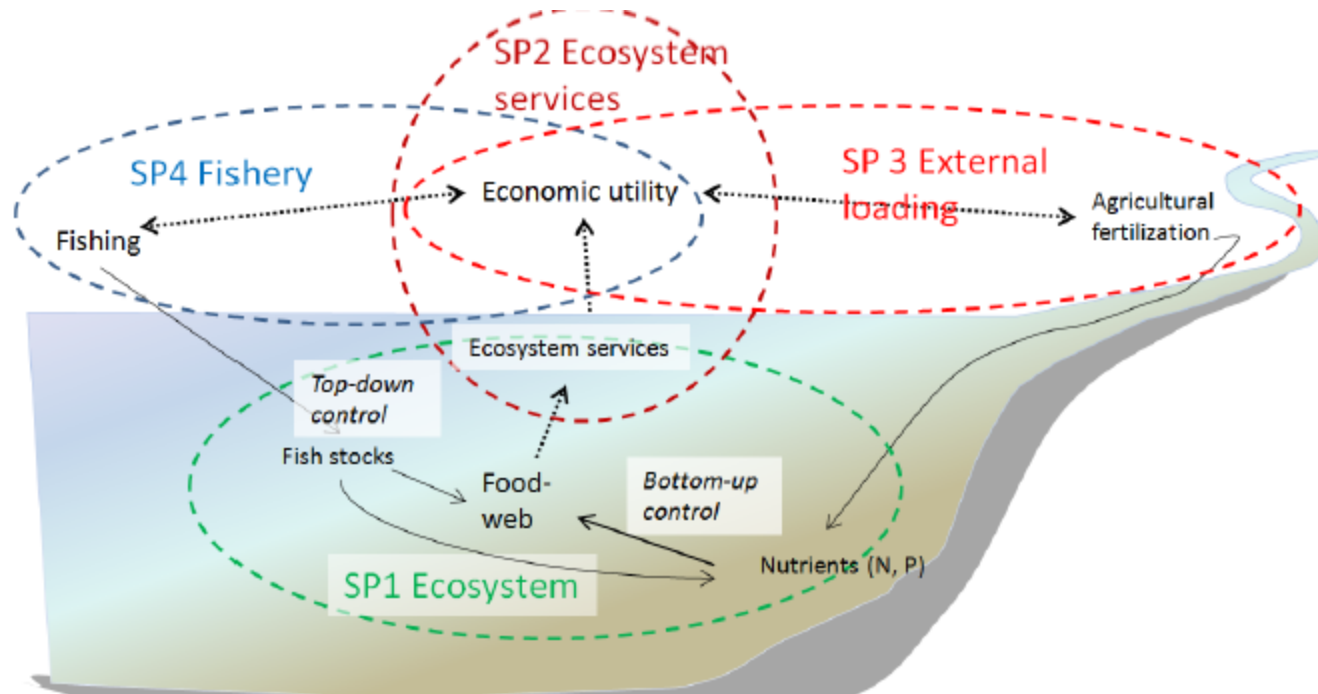

## Good Environmental Status: scoring system (Society's utility function)

- Defining objective function/scoring system facilitates analysis
  - Expected utility of a set of management measures
- How to specify?
  - Use of non-market valuation studies?

Impact	Score
no impact	0
closes less than 10% of the gap	3,125
closes 10-20% of the gap	6,25
closes 20-50% of the gap	12,5
closes 50-80% of the gap	25
closes 80-100% of the gap	50
Good Environmental Status	100

# Eutrophication & biomanipulation

Economics of Aquatic Foodwebs: Finnish Academy Project

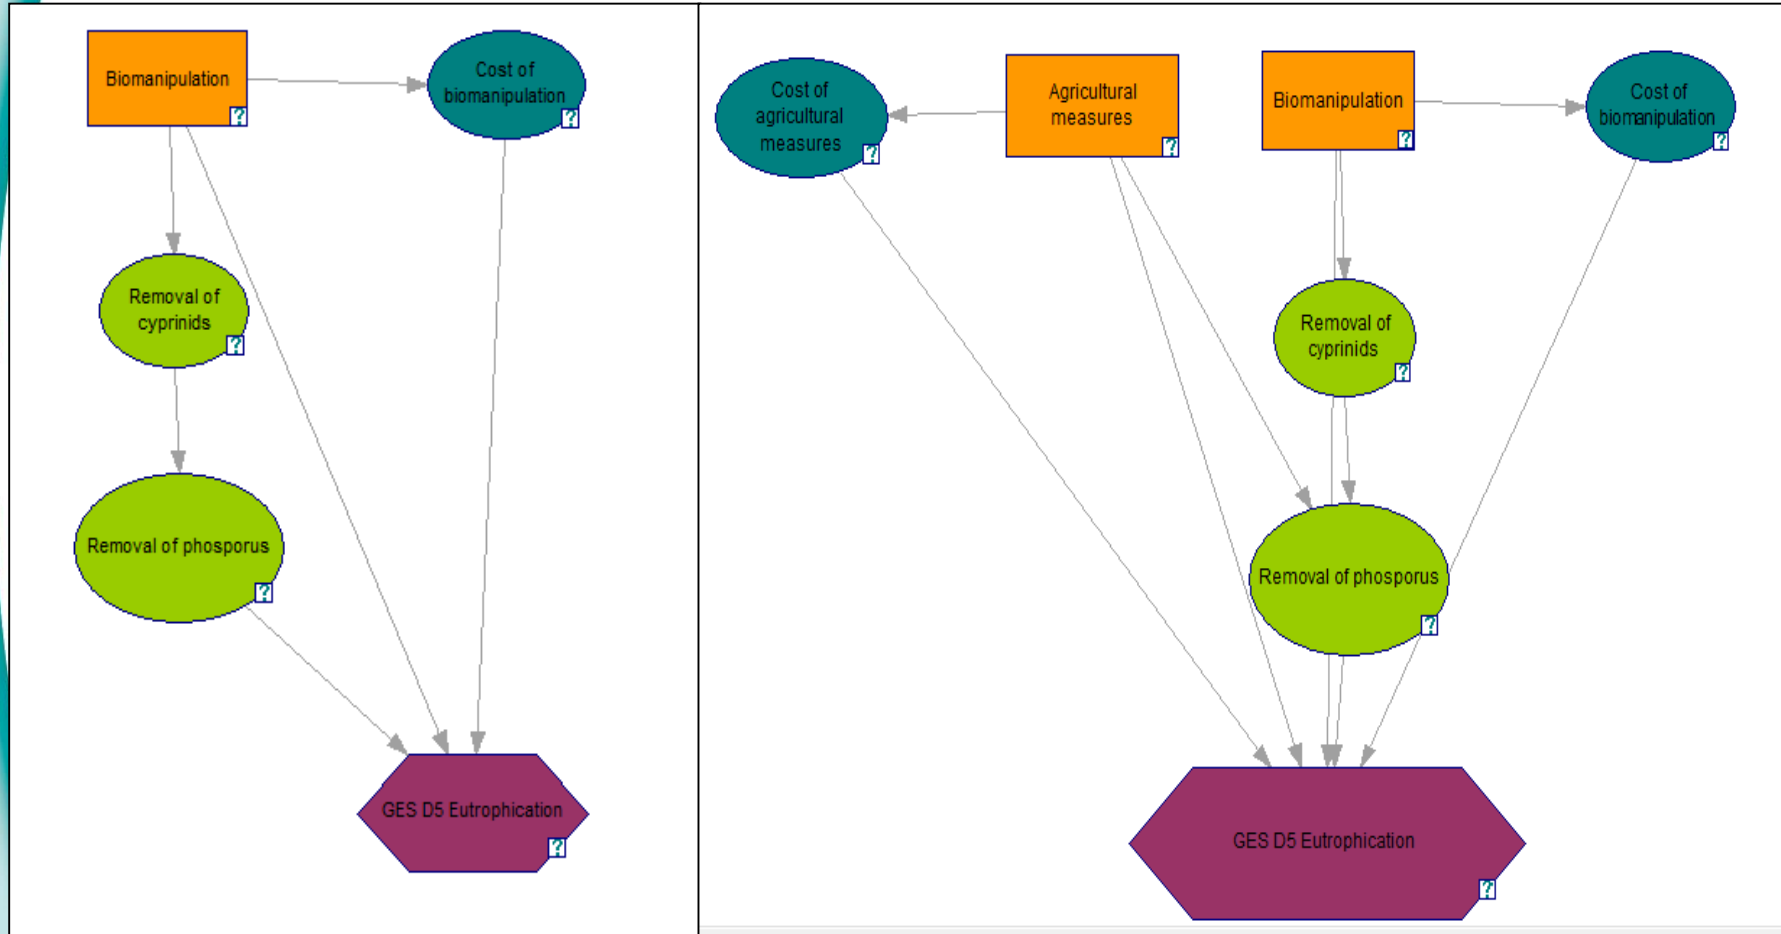

<http://www.aka.fi/en-GB/A/Programmes-and-cooperation/Research-programmes/Ongoing/Sustainable-Governance-of-Aquatic-Resources-/AKVA-projects/Economics-of-Aquatic-Foodwebs-ECA/>

## Eutrophication & biomanipulation

- High concentration of nutrients promotes excessive growth of algae
  - Murky water, toxic blooms, hypoxia, increase in low value fish populations
- Nutrient load reductions: agriculture, waste water treatment
- Biomanipulation through targeted fishing
  - Foodweb effects
  - Nutrients of catch
- Target species of biomanipulation have low value
  - Reversed fisheries problem: subsidies

# Optimal eutrophication management

## Conclusions

- EU's marine strategy framework directive calls for
  - Ecosystem approach
  - Cost-effectiveness and cost-benefit analyses
- Lack of data, models & resources
  - Pragmatic approach needed
- Bayesian Nets a possible solution
  - Graphics
  - Optimisation
  - Uncertainties

Thank you!
