#### The impact of information needs satisfaction on the creativity of visual art teachers

#### Abstract

**Purpose** – The aim of this study is to investigate how the information needs satisfaction of visual art teachers affects their creativity. Visual art teachers' information seeking behaviour and specifically the association of information needs satisfaction with creativity has been an understudied area, despite competent information seeking being considered essential for high quality practices of art teachers.

**Design/methodology/approach** – A questionnaire survey was developed addressing the information seeking behaviour of art teachers, informed by Wilson's model (1981), including visual art teachers' information needs, information resources, obstacles faced while seeking information and the perceived impact of information needs satisfaction on visual art teachers' creativity.

**Findings** – The study included 298 visual art teachers in Greece. The results demonstrated that the key information needs of art teachers were mainly related to materials' properties, techniques for creating artwork, and artwork promotion methods. Online information sources were the preferred sources of art information, followed by colleagues, personal collections, and visits to galleries and museums Our study identified lack of time, lack of specialized libraries, and copyright, as the main barriers to information seeking.

**Originality/value** – Information about art plays a substantial role in visual art education, while visual art teachers' information needs satisfaction positively influences their creative endeavours. There is a need to further explore the digital information needs of visual art teachers.

**Keywords** Visual art teachers, information-seeking behaviour, Wilson's model, information needs, information resources, information barriers, creativity, survey.

Paper type Research paper

#### Introduction

Over the last decades, the use of online information technologies has changed the information practices of visual art teachers (Wright, 2016). While the internet provides visual art teachers with a wide range of resources, in order to fulfil their creative and educational information needs, the abundance of unreliable or low-quality online information (e.g., providing shallow knowledge, misinformation, low-quality artwork or inaccurate artist details) has intensified information overload, confusion and uncertainty (Bawden and Robinson, 2009). Research highlights the need to develop information literacy skills that are important for effective online information seeking practices (Munster et al., 2018; Krtalic and Dinnen, 2022) and for achieving educational and creative endeavours overall (Challener, 1999; Daniels, 2018; Zreic et al., 2021).

Art information plays an important role in the creativity of visual artists (Beaudoin and Brady, 2011; Frank, 1999; Hemmig, 2008, 2009; Kratalic and Dinnen, 2022), while visual art teachers require good quality information for various purposes to satisfy their creative and multidimensional role as educators. For example, their information needs might include art creation techniques, material properties, digital visual editing software (such as Illustrator and Photoshop), current art exhibitions and museums, grants, and scholarships, as well as methods to promote their work and share their ideas and experiences. They may also seek information to teach their students about new forms of visual art (such as digital art and animation), to enrich their learning and teaching practices with digital artifacts (e.g., digital photographs of famous works of art) or to enhance their teaching materials with information on inquiry-based and collaborative learning, involving their students in art projects in class (Marner, 2023; Sang 2009). To meet these needs, visual art teachers can turn to one or a combination of information sources, such as online search engines (e.g., Google), art gallery websites, digital art magazines (e.g., Art News, Aesthetica, The Art Newspaper), online social networks (e.g., Facebook, LinkedIn), or offline sources such as other colleagues or librarians.

Several authors, including Bates (2001) and Hemmig (2008), have summarized research on visual artists' information seeking behaviour. Existing research highlights the usefulness of online information for the creativity of visual artists (Larkin, 2010; Lee and Haddow, 2017; Mason and Robinson, 2011), considering it to be a powerful source of art information. Kundu's (2015) research highlights the usefulness of online information to art teachers. Sang (2009) found that the internet allowed visual art teachers to share information and expand their access to new art resources. Research on how artists seek information conducted by Cobbledick (1996), Hemmig (2008, 2009), Gericke and Zijl (2002), and Kautonen (2015) also revealed a relationship between information seeking and artistic creativity. The importance of digital competences and information literacy skills of visual art teachers, have been noted by Greer (2015), Nicholas et al. (2010) and Zhao et al. (2018). In addition, Cordell (2013) emphasized that digital literacy is essential for accessing reliable online resources efficiently and effectively; while information literacy provides the evaluation skills needed to assess quality art information.

This study examines a rather under researched area in the domain of visual art teachers' information seeking behaviour, specifically exploring the impact of information needs satisfaction on creative endeavours, in view of the diversity of visual art teachers' information needs, the information resources they use and the obstacles they encounter while seeking information.

#### Literature review

Previous information seeking empirical research in the domain of visual art, has focused on different user groups, including visual art students' information needs for materials, techniques and trends (Daniel, 2018) as well as the information needs of visual artists (Lorenzen, 2004; Lee and Haddow, 2017). For example, Lorenzen, 2004 found that visual artists need information for understanding the art creation process, the latest techniques and experiences of other artists from galleries, exhibitions, and museums as well for keeping up with trends related to using the internet for promoting their art, sharing ideas with other artists through online groups, interacting with online galleries and museums, and showcasing their art online. Visual artists access to online information allows them to participate in the artistic process globally and share their ideas and artworks with other artists, regardless of their cultural background (Lorenzen, 2004). However, factors such as cost of access to resources and lack of information literacy skills can influence the information seeking behaviour of emerging professional artists (Mason and Robinson, 2011; Treat and Judkins, 2018).

Research with visual art teachers has found that art faculty members need specialized art libraries for their scholarly work and teaching (Gregory, 2007), while different sociodemographic characteristics (such as gender, age, qualifications, institution, working environment, artistic disciplines, field of instruction/ interest) significantly influence information needs and information seeking behavior (Gericke and Zijl's, 2002). In addition, although dynamic changes in technology have affected information seeking behaviour in the visual arts (Larkin, 2010; Lee and Haddow, 2017; Gregory, 2007), access to digital content for visual art teachers is hampered by technology and language barriers (Robinson, 2014; Usak, 2011). Interestingly, the library is still recognized as a key place to search for information (Daniels, 2018; Krtalic and Dinnen, 2022; Mason and Robinson, 2011; Usak, 2011) but certain barriers exist, including lack of experience using libraries, difficulty in navigating indexes, and lack of time.

Although there is some informative research on the sources of information that visual art teachers use, more empirical research is required to understand the impact of information needs' satisfaction on the creativity of visual art teachers. Borrowing a constructivist approach from social learning theory, via the lenses of traditional constructive theoretical approaches represented by seminal theorists such as Piaget (1968) and Vygotski (1978), human artistic activities can be interpreted as "constructivism" socially situated phenomena, where an artist, similarly to a learner, "constructs" their own knowledge from interacting with past information, experiences and other artists. In constructive approaches within classroom practice, learning is an active process of acquiring new knowledge and creating understanding, which relates both to the learner's prior experiences, the collaborative, social learning environment in which learning takes place and existing meaning systems and knowledge domains. Following that line of enquiry, artists' creativity can be interpreted as the outcome of acquiring information and building knowledge structures that allow to create new, alternative or individual artistic creations, beyond just a "slippery concept that can be described as an ability to create something from nothing" (Liggett, Townsley & Earnshaw, 2023, p. vii). Creativity is not only based on individual attributes and creative capacity but on a wide variety of factors that include, among others, the context in which the work is produced, the social and cultural factors at the time the artwork is produced, and previous art traditions (Combrich, 2007). These determine how novel interpretations of existing artistic works are made (for example, based on material and practical techniques or the aesthetic principles of specific art movements), making connections with previous works of art, and understanding theoretical approaches, artistic ideas, emotions, values, and meanings that represent the wider socio-cultural and political context. Creativity is also made possible based on cultural and social context conditions, for example ones that promote education and learning as an "fundamental external factor that influences creativity" (KEA European Affairs, p.7).

Previous research has explored the role of information and education in creativity (Amabile, 1988) and the ways in which it can be enhanced by means of recognizing and satisfying information needs, highlighting how information behaviour influences that process. Although creativity has been linked to different individual and contextual characteristics (such as talent, education, cognitive skills, interest patterns, personality dispositions, and work motivation, which distinguish creative from non-creative individuals) (Amabile, 2001), the role of recognizing information needs and using information sources forms an important component of the process, as it becomes the means for individuals to acquire knowledge and technical skills within the domain of their practice (Amabile, 1996). When planning a new artistic work, identifying the creative task or problem, generating, evaluating and selecting information to accomplish the creative output become key stages of the creative process. These represent the "domain-relevant" dimension, which together with creativity relevant skills of the artist and work motivation form three key parts of the artistic activity (Amabile, 1983). As creative artists engage in information seeking to expand and transform their existing information and knowledge domains, examining the process of effectively sourcing, evaluating and selecting information sources to satisfy information needs in the creative process presents interesting lines of empirical research enquiry.

However, little knowledge currently exists on the impact of information needs satisfaction related to different artistic goals or in different fields of visual art, where "purposive seeking for information" takes place "as a consequence of a need to satisfy a goal" (Wilson, 2000) for artistic outcomes. User satisfaction studies in information related environments typically present an information system centered view with an emphasis on preferred information sources, use satisfaction and improved system design, rather than on the individual's overall information needs satisfaction which may reveal information-seeking satisfaction gaps. Following a user-based view of the concept of user satisfaction, and turning to the perceived levels of satisfying a need for the creative goal rather than a search system "analysed according to systems features and variables", presents a more holistic study of users from the viewpoint of users (Talja & Hartel, 2007) that follows an established user-centred paradigm in information science research (Dervin and Nilan, 1986; Vakkari, 1997). According to Hemming, for example, the information needs of creative artists may demonstrate "idiosyncratic" information use with preference for personal collections and a "dissatisfaction that drives the perpetual need for fresh sources of information", making a call for information providers to "comprehend both the need and the limitless range of possible sources, and to find creative ways to bring the

artists and the sources together" (Hemming, 2009).

This research therefore addresses current research gaps by focusing not only on the information seeking preferences of visual art teachers (including their information needs, the resources they employ to find information, and the obstacles they encounter when they seek visual art information) but also on their information needs satisfaction and the role this plays on their creativity overall.

#### **Research Aim**

The aim of this research was to first explore visual art teachers' information seeking profiles by means of a) capturing their most frequent information needs, b) identifying the most frequently information sources they employed, and c) investigating the most important obstacles they encountered during information seeking. This was followed by a study of visual art teachers' self-perceived impact of information needs satisfaction on their creativity.

#### Methodology: theoretical framework

This study was grounded on Wilson's macro model of information seeking (Wilson, 1981) which was adapted through an exploratory review of the literature for the context of visual art teachers as shown in Figure 1. Wilson (1981; 2000) argues that the motivation for information seeking arises from a person's social/professional role, which in this context is the visual art environment. Personal and contextual factors have an impact on the way in which individuals both search for and use information (Bawden and Robinson, 2013; Beghetto and Kaufman, 2007).

#### {Please place Figure. 1 about here}

In the context of this study, information needs were studied as generated with the purpose of satisfying the creative and multidimensional roles of visual art teachers as educators whose information needs may include art creation techniques, material properties, digital visual editing software (such as Illustrator and Photoshop), current art exhibitions and museums, grants, and scholarships, as well as methods to promote their work and share their ideas and experiences. To meet these needs, visual art teachers can turn to one or a combination of information sources, such as online search engines (e.g., Google), art gallery websites, digital art magazines (e.g., Art News, Aesthetica, The Art Newspaper), online social networks (e.g., Facebook, LinkedIn), or offline sources such as librarians, other colleagues (visual art teacher) or friends.

In the information seeking process visual art teachers encounter different personal and environmental barriers (such as lack of information literacy skills and familiarity with digital indexes and databases, distrust towards digital information, and limited access to certain sources of information due to factors such as cost, copyright, or lack of specialized libraries for visual art). For example, Stam (1995) described visual artists as compulsive browsers and identified obstacles such as difficulty in using indexes and lack of time. By reducing barriers, such as developing information literacy skills, art teachers can better assess the validity of art information and reduce potential risks (Robinson, 2014).

#### Survey design and questionnaire development

This study was conducted by means of a questionnaire survey that was informed by Wilson's model (1981) and adapted to capture visual art teachers' information seeking behaviour, the obstacles they encounter and their self-perceived importance of the impact of information needs satisfaction imposes on creativity in different fields of visual art (Table 1). The purpose of the survey was not to further adapt the different model dimensions, but to offer empirical evidence around the information needs, information sources and barriers that visual art teachers encountered and explore the impact of information needs satisfaction on their educational creative practices.

#### {Please place Table 1. About here}

The measurement scale employed followed a five-point Likert type scale to assess the frequency of information needs (12 items), the frequency of use of information resources (27 items), the importance of barriers involved in seeking information (9 items), and the impact of information needs satisfaction on various aspects of visual art teachers' creativity (12 items). The scale ranged from 1 "not at all" to 5 "very much". The survey design was approved by the Research Ethics and Deontology Committee of the University the researchers were affiliated

with. The visual art teachers participated in the survey on a voluntary basis after agreeing on its content and purpose. The questionnaire was administered using Google Forms.

#### Pilot testing and validity

A qualitative pilot study for the content validity of the questionnaire was conducted by eight (8) experts (scientists and established visual artists) to identify any ambiguities, to receive feedback, and make improvements. Participants were briefed on the purpose of the survey and provided their comments for the questionnaire. After careful consideration of the experts' comments, the questionnaire was given its final format. To assess the reliability of the questionnaire, Cronbach's alpha was used. The results showed that all item groups in the questionnaire had a Cronbach's alpha index much higher than 0.7: 0.913 for the information needs of visual art teachers, 0.936 for information sources, and 0.779 for the barriers visual art teachers face when seeking visual art information.

#### Data analysis process

The SPSS version 22.0 statistical package was used for statistical analysis to investigate whether the distribution of demographic data affects the information behaviour of visual art teachers. The results of Kolmogorov-Smirnov and Shapiro-Wilk normality tests further showed that all the variables examined did not follow the normal distribution (p values for all normality tests < 0.001). Therefore, nonparametric Mann-Whitney U-test was used to assess significant differences between two independent subgroups, and Kruskal-Wallis H-test of one-way analysis of variance by ranks was used to assess differences between more than two independent subgroups (these are listed in the appendix and discussed in the results section). Principal components analysis (PCA) with the varimax orthogonal rotation method was used to identify groups of specific information needs, sources, and barriers. We considered Kaiser's criterion with factors reaching eigenvalue 1 as a factor extraction method. The results of Bartlett's sphericity test at p < 0.05 and the Kaiser Meyer–Olkin (value of 0.6 or above) confirmed the suitability of our dataset for structure detection. Bivariate correlation statistics between all clustered variables reported the statistical associations between the different items of the research instrument. The questionnaire was distributed exclusively among the members of the Association of Visual Art Teachers in Greece. It aims to bring together art teachers with the aim to promote art related education for the development of artistic literacy, visual art teaching methods, aesthetic education. It also supports the artistic work of its members, opening the paths of art to all, including students and tomorrow's citizens. Membership includes approximately 2000 visual art teachers, appointed in primary and secondary formal school education in Greece (Association of Visual Art Teachers, 2024).

The survey took place over a three-month period from July to October 2022 and a total of 298 visual art teachers participated by completing the questionnaire.

{Please place Table 2. About here}

#### Results

The majority of the participants were female (71.1%, n=212), born between 1965-1980 (Generation X) (62.1%, n=185), with a university undergraduate degree (68.5%, n=204) and had semi-professional visual artist roles (44%, n=131) (Table 2).

Appendix A. summarizes descriptive statistics in all the survey items using frequencies and median values. Moreover, subgroup test statistics for all demographic variables are reported through Mann–Whitney U test and Kruskal-Wallis H test. It is worth noting that although in the Appendix the significant sub-group statistics are identified in the tables of results as

 superscripts, only some of the statistical differences between the different demographic categories are further mentioned here.

In Appendix Table A1 visual art teachers reported the following information needs as more frequent: photographs (median=4), material properties (median=4), art creation techniques (median=3), digital methods for promoting and presenting artworks (median=3), current visual art exhibitions (median=3), and professional development (median=3). In Table A2 of the Appendix, it is demonstrated that online search engines, such as Google and personal digital libraries were used more frequently than other sources of information (median=4). Visiting museums, consulting with colleagues who are also visual artists, and using their own personal library or printed collection were additional popular methods (median=4). However, teachers were less likely to rely on public/municipal libraries, national libraries, scientific databases, virtual art communities, Twitter, and LinkedIn (Median=2 or =1). Evidently, female visual art teachers tended to visit art galleries more often compared to their male counterparts (mean rank values of 157.25 and 130.38, respectively) and employed professional organizations such as the Chamber of Fine Arts more frequently than male teachers (mean rank values of 157.17 and 130.58, respectively). Moreover, younger visual art teachers tended to use more often digital art magazines (mean rank of 273.00, compared to 174.96 for older teachers), as well as art catalogues of visual artists' exhibitions (mean rank of 185.50, compared to 144.14 for older teachers), and Instagram (mean rank of 217.50, compared to 117.75 for older teachers). Visual art teachers with fewer years of experience (5-10) preferred to seek information more frequently in digital art communities than other visual art teachers (21-50 years of experience), with a mean ranking of 162.58 versus 122.13, respectively. Visual art teachers with fewer years of experience visited art galleries more often than others. Visual art teachers with 1-4 years of experience used Instagram more often than teachers with 21-50 years (i.e., p < 0.05, with mean rank 161.4 vs 122.18). Those who identified as professionals and actively created visual art tended to visit galleries more often, with an average rank of 171.02. By comparison, semiprofessionals had a mean rank of 145.89 and amateurs a mean rank of 129.95. Similarly, professional visual art teachers participated and attended conferences more often than semiprofessionals and amateurs (with an average rank of 168.94, compared to 139.96 and 142.67, respectively). Professional visual art teachers tended to seek information more often in virtual art communities, with an average rank of 174.73. By comparison, semi-professionals had an average rank of 133.85, while amateurs had an average rank of 146.26.

Appendix Table A3, presents the range of obstacles that visual art teachers encountered when seeking information. The most significant barriers reported were the absence of specialized visual art libraries (median=3), lack of time (median=3), and copyright (median=3). Specifically, female visual art teachers were found to encounter more barriers due to a "lack of time" than males (i.e., p < 0.05, with mean rank 155.77 vs 134.04, respectively). Visual art teachers who began their careers from 1981 to 1996 faced more time constraints than their older counterparts who began teaching from 1965 to 1980 (mean rank of 171.62 compared to 145.95). In addition, younger visual art teachers (1981 to present) faced difficulties in accessing specialized visual art libraries, which were more readily available to older teachers, who began teaching between 1965 and 1980 (mean rank of 171.62 and 139.85 respectively). Finally, visual art teachers who declared themselves professionals regarding their involvement in the production of visual artwork identified the lack of availability of reliable sources of information (mean rank of 165.58) as a more frequently encountered barrier, when compared to semi-professionals (mean rank of 137.97) and amateurs (mean rank of 150.12).

Visual art teachers stated that they are satisfied with the overall information needs (median 3) in Table 3.

#### {Please place Table 3. About here}

Appendix Table A4, demonstrates that information needs satisfaction of visual art teachers affected almost all the different areas of creativity considered in the study: visual art education (median 4), photography (median 4), digital art (video art, animation, cinema, etc.) (median 4), history of art (median 4), sculpture (median, 3), engraving (median, 3), scenography (median, 3), mosaic (median, 3), ceramics (median, 3) and decoration (median, 3). There was only a single area, Hagiography, that had a lower value (median 2).

Furthermore, the results of the Exploratory Factor Analysis (EFA) revealed two categories (factors) of information needs that collectively explained 65.42% of the total variance (Table 4). The two factors capture the perceived influence of professional development (nine items, Cronbach's alpha: 0.911) and creation techniques and materials (three items, Cronbach's alpha: 0.845). Table 4 presents the descriptive statistics (mean values and standard deviation) for these factors. Therefore, teacher visual artists attached more importance to the group of information needs related to the impact of visual art creation techniques and materials (mean=3.33) than to the information needs related to professional development (mean=2.97).

#### {Please place Table 4. About here}

The frequencies of information sources were grouped into seven factors, explaining 70.38% of the total variation (Table 5). The seven factors semantically captured different types of information sources, namely "Digital art sites" (five items, Cronbach's alpha: 0.843) "Conventional sources (galleries, museums)" (five items, Cronbach's alpha: 0.874), "Professional scholar sources" (two items, Cronbach's alpha: 0.875), "Libraries" (three items, Cronbach's alpha: 0.838), "Informal information on the Internet" (four items, Cronbach's alpha: 0.828) and "Personal colleagues collection" (three items, Cronbach's alpha: 0.714). Descriptive statistics of grouped variables for information sources showed that personal collections/colleagues dominated as the main sources of information (mean=3.65), while informal online information (Mean=3.35) was also used quite frequently by the visual art teachers who participated in our survey.

#### {Please place Table 5. About here}

Barriers to information seeking behaviour related to visual art teachers were grouped into two components, explaining 57.39% of the total variance. The EFA is presented in Table 6, with the two factors named "Environment" (5 items, Cronbach's alpha: 0.772) and "Personal information literacy skills" (4 items, Cronbach's alpha: 0.790). The results demonstrate that respondents gave equal importance to both groups of information seeking barriers.

#### {Please place Table 6. About here}

The impact of information needs satisfaction on the individual forms/fields of visual creativity was grouped into two components, explaining 66.668% of the total variance. EFA is presented in Table 7, with the two factors tentatively named "Fine arts" (7 items, Cronbach's alpha: 0.884) and "Applied arts" (5 items, Cronbach's alpha: 0.900).

#### {Please place Table 7. About here}

Table 8 includes the pairwise Spearman's rho correlation coefficients of the factors developed through EFA groupings, and the factors developed through EFA grouping of the creative employment domains of visual art teachers. Because the factors do not follow the normal distribution, which was tested by the Kolmogorov-Smirnov test that resulted in values p < 0.05, Spearman's rho test was chosen. We observe that the impact of information on the creative

activities (applied arts) of visual art teachers is positively associated to the frequency of information needs associated with professional development ( $r = 0.197^{**}$ ) and techniques and materials for the creation of visual artworks ( $r = 0.170^{**}$ ). The use of digital art websites is positively related to the frequency attached to information needs related to professional development ( $r = 0.431^{**}$ ). and techniques and materials for creating works of art (r =0.387\*\*). Professional scholar sources are positively related to the frequency of information needs about professional development ( $r = 0.421^{**}$ ) for visual art teachers. Another characteristic is that the frequency of informal use of information on the Internet is positively related to barriers in the environment of visual art teachers ( $r = 0.221^{**}$ ), such as lack of time. It also appears that interpersonal resources as expressed by the EFA grouping variable colleagues/personal collections play an important role in the search for information related to creative techniques ( $r = 0.459^{**}$ ) and professional development ( $r = 0.435^{**}$ ). The frequency of using conventional sources of information such as art galleries and museums to search for information correlates positively with the importance that visual artists' teachers attach to the techniques and materials ( $r = 0.324^{**}$ ) used to create artworks and their professional development ( $r = 0.454^{**}$ ). Therefore, we can conclude that visual art teachers visit art galleries in search of information to promote and exhibit their artworks.

{Please place Table 8. About here}

#### Discussion

Through the literature review, it was found that there is a lack of research on how information affects creativity of visual art teachers (Munster et al., 2018; Krtalic and Dinnen, 2022). This study therefore aimed to additionally investigate the impact of meeting information needs on the creativity of visual art teachers. Our findings showed that visual art teachers attribute their information needs (e.g., searching for photographs, finding information about materials and their properties, artmaking techniques, etc.) to their creativity. This is consistent with other studies showing that visual artists need information to be creative (Beaudoin and Brady, 2011; Cobledick, 1996; Hemmig, 2008; Krtalic and Dinnen, 2022). However, the information related to material properties and techniques for creating visual artworks prevailed in importance, which means that visual art teachers needed to be informed about the techniques and properties of materials to be better able to cope with the challenges of their work. This finding adds more empirical evidence to earlier research that similarly found that visual art teachers need information about visual art teachers need informat

Previous research has found that visual art teachers in the teaching process mainly make use of resources containing digitised artworks (e.g., <u>Google Arts & Culture</u>), virtual museum environments or galleries (Gerlich & Perrier, 2003; Kolyvas & Nikiforos, 2023; Ngan, Lee & Koo, 2003). They also use interactive digital environments that positively influence their students' creative expression (Roland, 2010; Schrum & Levin, 2009; Tillander, 2011).

The present study found that online search engines (e.g., Google) were the preferred source of information for visual art teachers, followed by colleagues, personal collections, and visits to look for information in galleries and museums. This is also consistent with other studies (Frank, 1999; Layne, 1994; Robinson, 2014) stating that visual artists, when searching and collecting information prefer Internet search engines, such as Google, to library electronic systems because they find them quite technologically complex.

Moving one step further, our results capture the impact of information needs satisfaction of visual art teachers on their creativity, in the same vein as Layne (1994) and Robinson (2014)

for visual artists and Frank (1999) for art school students. As shown in previous research by Kundu, 2015; Larkin (2010), Lee and Haddow (2017), Gregory (2007) and Sang (2009) dynamic, changes in technology have influenced the information seeking behaviour of visual artists. This was also the case in this study, where there was preference for digital search sources and limited visits to libraries due to lack of time (Larkin, 2010; Lee and Haddow, 2017; Gregory, 2007). The findings also showed that the use of social media, such as blogs and Instagram enhanced the creativity of visual art teachers, which coincides with and further validates previous qualitative research by Budge's (2013) on a community of visual artists, where creativity is significantly enhanced by the use of social media tools such as blogs, Twitter, and Instagram.

In terms of the main barriers to information seeking by visual art teachers, our study identified environmental barriers (i.e., lack of time, lack of specialized libraries, and copyright) to meeting their information needs, which is consistent with existing studies (Frank, 1999; Layne, 1994; Robinson, 2014). However, the present study showed fewer barriers related to participants' characteristics, such as language, information literacy, and lack of confidence in digital resources, which have been prominent in previous research (manifested as barriers related to foreign language, computer literacy, and information literacy skills) (Robinson, 2014; Usak, 2011). This could be explained by the high level of education of the participants who all held a university degree and almost a third (31.5%) a master's or doctoral degree.

Interestingly, there was preference towards informal exchange of interpersonal information, that is, exchanges of information with other visual art colleagues, teachers and friends. This observation has also been confirmed in previous studies (Cobbledick, 1996; Hemmig, 2009) and can be attributed to increased levels of trust in this study between colleagues and friends/members of the Association of Visual art Teachers and the Greek Chamber of Fine Arts. For example, when faced with a problem either related to their teaching practices or creative techniques, visual art teachers often discuss it with fellow visual art teachers who face the same or similar problems.

The study results highlight the primary role of information in the creativity of visual art teachers. Our study revealed that information need satisfaction contributes to the creativity of visual art teachers which is in par with previous research (Gregory, 2007; Lee & Haddow, 2017). It is therefore important to raise policymakers' awareness for investing art libraries and other information services within the educational ecosystem. In addition, librarians should update art collections, and introduce actions such as briefings, workshops, and information literacy programs that could aim to meet the information needs of visual art teachers. Visual art teachers should receive further expert advice on finding up-to-date, reliable, and 'safe' information sources, such as high-quality digital images, specially designed printed materials, and/or online visual art teachers' networks. Every effort should be made to turn libraries into 'learning communities' and attract visual art teachers. Visual arts teachers' associations and interest groups could further contribute by means of organizing visits to museums and other places of cultural interest as well as more generally promoting art and visual art creativity. This may take the form of seminars addressed to visual arts teachers with suggestions regarding ways of using, evaluating, and utilizing digital information sources (e.g., using information guides, exploring copyright, etc.). This can also extend to the creation and publication of educational material and guides suitable for visual arts teachers and students that explain methods of searching and utilizing information.

The present study reviewed and adopted Wilson's (1981) model to provide an effective theoretical framework for studying the information-seeking behaviour of visual art teachers. Visual art teachers' information seeking is related to their creative profession and is guided by

specific motivations related to the work context. However, several intervening variables present themselves as barriers to this process. These included the lack of specialized visual art libraries, lack of time, copyright, cost of access to resources, and lack of availability of authoritative visual art information sources; these may act as either barriers or as reinforcing factors (when reversed) in the information seeking process (Kostagiolas et al., 2013).

It is important to note that our survey results should be generalized with caution. The survey limitations include that the survey was conducted exclusively among Greek visual art teachers working in the Greek education system and that a convenience sampling method was followed, involving a snowball approach. Perhaps a larger and international scale survey could provide additional evidence on the important role of satisfying information needs in fostering creativity among visual art teachers across Europe or internationally.

#### Conclusion

The search for information on visual art has a strong (direct and/or indirect) impact on improving the creativity of visual art teachers. This evolving research path requires an on-going consideration of the design, the collection process and the careful selection of elements of interest (objectivity, accessibility, etc.) that form the basis of the study. Investigating the behaviour of visual art teachers seeking information for creativity is critical to enriching our knowledge about the impact of information on creativity overall (Lee and Haddow, 2017; Ihadiadene and Riviera, 2021). To improve future research in this area, it is important to go beyond simply describing information needs and sources to focusing on information-seeking behaviour models that have practical applications in real-life situations, of which Wilson's (1981) model is a good example. As Wilson (2010) notes, research in this area should ultimately produce ideas that help people navigate the information landscape more effectively. Visual art information-seeking research could therefore focus on exploring more specifically the information needs of visual art teachers in practice, for example how an art teacher can use information to improve students' abilities to think synthetically and analytically and enhance their critical thinking skills by incorporating reflective processes into the classroom. A teacher could require information of different nature and scope to present an image of a work of art collected from various sources, both formal and informal, such as different websites (e.g., Google Arts & Culture), digital art magazines (such as Art News and Aesthetica), databases, conferences, and fellow visual artists. This approach would help students to decode the artwork and better understand the culture in which it was created (Fowler, 1996: 55). Research shows that satisfying information needs is crucial for effective day-to-day management of creativity among visual art teachers (Budje, 2013; Krtalic and Dinnen, 2022; Kundu, 2015). Colleagues are a valuable source of information, as they can share their knowledge, discuss issues related to creativity and teaching, and offer help. In addition, well-informed visual artists can make better decisions about their educational practices. Therefore, the satisfaction of information needs of visual art teachers supports their work and enhances their effectiveness. The present study, therefore, confirmed the following:

(1) It is crucial for visual art teachers to have access to relevant visual art information to enhance their creativity.

(2) Regular information from various sources is necessary for visual art teachers to address educational challenges and improve their educational practices.

(3) Digital resources such as digital art websites, social networks, and informal information resources over the internet are employed by visual art educators to seek information related to their creative endeavors.

(4) The internet is used extensively by visual art teachers, and although it can be a valuable resource, at the same time, it can be a barrier.

The study highlighted that visual art teachers exhibit diverse information behaviour. Further research is required to identify the specific components of their behavior that can contribute to their educational practices. Meeting the information needs of visual art teachers has a positive impact on their creativity. This study is among the first to shed light on how satisfying information needs can influence creative practices in this context. However, additional studies are needed to validate and expand these findings, in order to gain a better understanding of how visual art teachers seek information.

Table 1. Questionnaire dimensions based on the Wilson model adaptation for visual arts	
teachers' information seeking.	

Questioner dimensions	Definition/measurement items
Information needs on the creativity of visual arts teachers (Items <i>N</i> = 12)	Measures the frequency of specific information needs for artistic creativity related to job search, professional development, recent visual arts publications, photos, techniques of creating artwork, materials properties, digital visual editing software (e.g., Illustrator, Photoshop, etc.), current art exhibitions, grants, scholarships, conventional methods of promoting artwork, digital methods of promoting artistic work.
Sources of information used by visual arts teachers. (Items N = 27)	Measures the frequency with which teachers use specific sources when seeking information in the process of creating visual artwork as well as their teaching work: Public libraries, National Library, Special libraries (e.g., academic libraries, etc.), personal libraries, personal digital libraries, museums, galleries, magazines, art magazines, digital art magazines, art catalogues, technical manuals, art gallery websites, private collections, conferences, scientific databases, workshops, professional organisations, virtual art communities, search engines (e.g., Google), colleagues visual artists, YouTube, Facebook, Twitter, LinkedIn, Instagram,
Obstacles when visual arts teachers seeking information (Items <i>N</i> = 9)	Measures the importance of the obstacles that art teachers face when searching for information: lack of availability of reliable sources of information copyright, cost of access to resources, lack of time, lack of specialized visual arts libraries, lack of familiarity with the search for information, lack of familiarity with the use of digital indexes/database, lack of trust in digital visual information.
Impact of information needs satisfaction on visual art teachers' creativity (Items <i>N</i> =12)	Measures the impact of information needs satisfaction on individual forms (aspects) of visual creativity: Painting, sculpture, engraving, visual education, photo, digital art, scenography, Byzantine painting, mosaic, ceramics, decoration, Art history (research-analysis).

Demographic characteristics	Frequency Percent)	(Valio
Sex		
ſales	86	28.9%
emales	212	71.1%
Birth year		
946-1964 (Baby Boomers)	24	8.1%
965-1980 (Generation X)	185	62.1%
981-1996 (Millennials-Generation Y)	89	29.9%
Marital status		
live with my parents or a roommate	21	7.0%
Inmarried/I am single	71	23.8%
Divorced or separated	36	12.1%
farried, cohabiting, civil partnership	170	57.0%
Higher level of visual arts education	ion	
faster's/Doctoral degree	94	31.5%
Iniversity degree	204	68.5%
Employment status as a visual artist (in terms of the	-	
production of visual artworks)		
Imateur	76	25.5%
emi-professional	131	44.0%
Professional	91	30.5%
Total years of employment (working) as a visual	artist	
Intil 4	37	12.4%
5-10	81	27.2%
1-20	109	36.6%
1-50	71	23.8%

Table 3. Satisfaction	with the	overall	current	information	of	visual	art	teachers	on
creative activity									

	Measurement scale (1 "Not at all", 2 "A little", 3 "Quite a bit", 4 "A lot", 5 "Very much"							
	1	2	3	4	5	Median		
Satisfaction with the overall current information of visual art teachers on creative activity (Valid $N = 298$ )	19 (6.4%)	119 (39.9%)	129 (43.3%)	27 (9.1%)	4 (1.3%)	3.00		

Note(s): Mann-Whitney U test and Kruskal-Wallis H-test showed that there are no significant

differences in terms of overall satisfaction inal of Documentation
