20 Change

21 **Summary**

22 *Background*

23 Podcasts have become a popular digital forum for discussing scientific information with peers, as
24 well as with the non-scientific community, often referred to as 'edutainment'. It is unclear how
25 science-based podcasts can support the veterinary industry through, for example, supporting good
26 husbandry practices.

27 *Objectives*

28 To understand the influence of 'edutainment' on equine owners' husbandry decisions

29 *Study Design*

30 The sample population was listeners of the Conversations in Equine Science (CES) podcast recruited
31 to complete an online survey via a link promoted by the CES hosts. The survey contained Likert-like
32 questions assessing how listeners rated the importance of different forms of evidence when making
33 husbandry decisions and questions relating to husbandry changes made.

34 *Methods*

35 A mixed methods approach was used to analyse the data. The Likert package for R was used to
36 explore importance ratings. Free text questions were analysed via a content analysis with a
37 constructionist epistemological position.

38 *Results*

39 The experience of veterinarians and scientific evidence was considered the most important forms of
40 evidence that owners used when making decisions about their horse's management (93% agreed
41 and 91% agreed they were important respectively). Additionally, 74% of respondents had made a
42 change to the management or training principles prompted by an episode of CES, suggesting

43 edutainment can be a prompt to management change. Of these, the majority (55%) had done so
44 based on a joint discussion of the podcast and their own reading of the evidence.

45 *Main Limitations*

46 This was an opportunistic sample of those already invested in the edutainment format, and may not
47 represent those owners with no interest in scientific evidence.

48 *Conclusions*

49 Podcasts are an easy-access, low-cost medium to convey research and current trends in the
50 equine/equitation science genre. They may be a valuable tool for the veterinary industry to employ
51 to support horse welfare.

52

53

54 **Clinical Relevance**

- 55 • Supporting owners to make good husbandry decisions requires veterinarians and associated
56 professionals to have an understanding of why owners make decisions to change
57 management practices
- 58 • In this sample of owners with an interest in equine science, we see that management
59 decisions can be influenced by veterinary opinion and evidence from equitation science
- 60 • Veterinary professionals can promote good husbandry and equine welfare through
61 supporting owners to interpret scientific evidence either personally or through edutainment
62 sources

63

64 **Introduction**

65 Animal welfare encompasses the health, behaviour and environment of the animal and its
66 consideration is a key component of ethical animal husbandry. The management choices equine
67 owners make regarding their animals are an integral part of that animal's subjective experience. A
68 recent, albeit pre-Coronavirus pandemic, set of stakeholder interviews suggested there was a range
69 of health, management and riding/training associated welfare challenges for horses in Great Britain
70 (Horseman et al., 2016). These include weight concerns, laminitis, skin concerns, parasites, rugging
71 choices, food and water provision, social isolation, tack fitting, and the use of positive punishment
72 training aids. Often in the global context, welfare concerns for equids are in the realm of 'hard wins'
73 where the marginal return on the gain may be hard to justify against the cost of implementing the
74 change (Pritchard et al., 2018). However, many of the welfare challenges identified by Horseman et
75 al's stakeholders, such as the use of over-rugging or over-feeding can be addressed through low-cost
76 changes to management. There is extensive research available regarding best practices in
77 management from housing to behaviour (Hothersall & Casey, 2012). Additionally, it has long been
78 recognised that the veterinary professional has a key role to play in informing clients of potential
79 welfare challenges (Green & Tong, 2004), and while there are certainly challenges in communication
80 across associated professions and with clients (Loomans et al., 2009; Moyer et al., 2018)
81 communication skills are an increasingly recognised key component of the veterinary curriculum
82 (Haldane et al., 2017; McDermott et al., 2015). Why then do welfare challenges persist when the
83 veterinary profession has the collective knowledge and skills to communicate these issues to
84 owners?

85

86 One lesson from the field of public health is that human behavioural change is surprisingly hard.
87 There is a wealth of information regarding common human health issues such as the impacts of
88 obesity and alcohol consumption, and yet general population behaviours are invariant (Kelly &

89 Barker, 2016). Behavioural change interventions seem to work best when they incorporate the social
90 and community aspects of behaviour (Abraham et al., 2009; Van Achterberg et al., 2011) and do not
91 rely on evidence 'strength' or the communicated opinions of experts such as doctors (Kelly & Barker,
92 2016), and presumably veterinarians in the case of equine management choices. To support owners
93 to make effective management choices, veterinarians and related professionals need to explore how
94 different communication methods can support owners to make effective changes to their
95 management choices.

96

97 Animal owners are often keen to engage with resources on management and animal welfare
98 (MacKay et al., 2016, 2018), and online resources such as Massive Open Online Courses can provide
99 the impetus for changing attitudes in owners, partly due to their entertainment value and the
100 perceived social relationships with the educators (Watson et al., 2016). Entertaining educational
101 content is often dubbed 'edutainment', broadly referring to media or toys with a dual purpose of
102 developing skills or knowledge while providing positive or playful experiences (Buckingham, 2007).
103 Edutainment has been theorised to support learning by supporting learners to internalise knowledge
104 in a positive and supportive environment (Aksakal, 2015). In this way, it may approach some of the
105 aspects of successful behavioural change interventions, namely in supporting the social aspects of
106 behaviour, e.g., equine owners consuming edutainment products may be supported to make
107 management changes due to the perception of social trends and pressure.

108

109 One form of edutainment is the podcast. A podcast can be defined as primarily audio content that is
110 downloadable or streamable via the internet and is broken down into episodes. Comparable to live
111 radio programs, but on demand. A podcast can be accessed anywhere, anytime and can be
112 produced by anyone (Fox et al., 2021). Podcasting, as a medium, began in 2004. Most topics dealt
113 with current and future advances in computer science and technology (Hammersley, 2004). Science-

114 based podcasts showed only a linear growth from 2004 to 2010 (MacKenzie, 2019) with exponential
115 growth occurring from 2010 to 2018. In 2021 there were over 2 million podcasts with an estimated
116 48 million episodes encompassing a myriad of topics and genres (Fox et al., 2021). Currently, Apple
117 lists 449,041 active podcasts, defined as episodes being added on a routine basis (Gray, 2023).
118 Smartphones are the preferred device for podcast streaming with 88% of listeners using a
119 smartphone (Buzzsprout Podcast Stats, 2023).

120

121 The year 2005, became known as “the year of the podcast” with the word “podcast” being named
122 the word of the year by the New American Oxford Dictionary (Bowers, 2005). This was also the year
123 that one of the first recognized science podcasts, The Point of Inquiry, was launched (Bottomley,
124 2015). Point of Inquiry is still actively producing episodes in 2023. MacKenzie et al. found a total of
125 952 English-speaking science podcasts available in February 2018. Their research also found that
126 65% of science-based episodes were hosted by scientists and 77% of those were geared toward the
127 general public (MacKenzie, 2019). A crucial element of science-based podcasts is the
128 communicators’ ability to engage with their audience. For science communication, the audio-only
129 format of podcasts can offer several advantages over traditional print and video mediums. The most
130 popular is the convenience to listen while performing other tasks. Merzagora notes that compared
131 to television and print, audio media is ‘more relaxed and reflective’; that it ‘allows the audience to
132 hear the true voice of the protagonist’ (i.e., the scientists); and that ‘the barrier separating the
133 listener from journalists and scientists is less impenetrable’ (Merzagora, 2004). In addition, podcast
134 hosts routinely use websites and social media to receive listener feedback and facilitate discussions.
135 This two-way interaction isn’t typically available in traditional broadcasting. It also seems to help
136 improve public trust in science (Birch & Weitkamp, 2010; Fox et al., 2021; Wynne, 2006). It has been
137 theorized that podcast audiences may feel more personally connected to the hosts of the podcast
138 than to other forms of media (Markman & Sawyer, 2014). This intimacy and the affective charge that

139 takes place between the student (listener) and teacher (host) is one of the most widely discussed
140 characteristics of podcasting. These attributes are linked to the intense para-social relationships that
141 develop between podcast listeners and their favourite hosts. This is thought to develop due to the
142 unmediated sound or lack of professional recording studios that gives the listener a feeling that the
143 podcast hosts are talking directly to them (McGregor, 2022). Academic podcasts have also shown
144 improved scientific information retention in students, medical patients, and the public (Lomayesva
145 et al., 2020; Prakash et al., 2017).

146

147 A general search of the term “horse podcasts” returns hundreds of horse-related podcasts on
148 Spotify, a common listening platform (Spotify, 2023). Many of these are made up of trainers,
149 veterinarians, or equine company representatives, serving as hosts, interviewing guests and
150 discussing topics of various horse industry concerns. Some have multiple sponsorships while also
151 offering listeners to buy additional services, products, or digital content memberships. Some
152 podcasts are hosted by horse enthusiasts that just want to share their love of horses and the joy
153 these animals bring into their lives. Other podcasts, such as the one used as the basis of the study in
154 this paper, are hosted by researchers and/or academics and report on equine science topics that
155 encompass all aspects of the horse world. The main objective is to improve equine welfare by
156 sharing and discussing new or pertinent research.

157

158 In this study, we were interested in whether an edutainment equine-focused podcast could support
159 equine managers to make changes to their equine’s management, and therefore be considered a
160 useful tool in improving the welfare of companion equids. A podcast, ‘Conversations in Equine
161 Science’, was used as a convenience sample and listeners invited were to respond to a survey
162 exploring motivations behind any recent management changes to their equines.

163

164 **Methodology and Results**

165 Ethical approval for this study was granted by the Royal (Dick) School of Veterinary Studies' Human
166 Ethical Review Committee, reference HERC_780_21.

167

168 *Research Questions and Researcher Position*

169 In this study, we were concerned with whether podcasts could support equine owners to make
170 evidence-informed changes to the management of their equines. The podcast 'Conversations in
171 Equine Science (CES)', as it is headed by authors Kate Acton and Nancy McLean, was used as a test
172 case. Author Jill MacKay is independent of the podcast and was responsible for the collection and
173 analysis of data. This research was not intended as impact evaluation with a quasi experimental
174 design exploring direct measures of horse ownership construct. Instead, we aimed to offer a
175 quantified preliminary analysis of a novel form of veterinary education to inform future research. It
176 was not possible within the scope of the study to extend it to other equine science-related podcasts.

177 The research questions were:

- 178 1) Who listens to CES and therefore what is its reach?
- 179 2) How frequently does CES prompt engagement with primary literature?
- 180 3) Does CES prompt listeners to change their equine management and how?

181

182

183 *Survey Design*

184 To explore the research questions, a survey instrument was designed to collect demographic data
185 from listeners, to question them on management changes made to their equines, and to
186 characterise what sources of data listeners use to base their management decisions on. Ratings of
187 evidence were based on a 5-point Likert-Like scale with descriptive anchors due to the robustness of
188 this question style (Dillman et al., 2009; Krosnick, 2018) from 'Extremely unimportant to consider' to
189 'Extremely important to consider', and invited participants to rate evidence such as scientific
190 evidence, evidence from fellow yard owners, veterinarians, coaches and instructors, the owner's
191 own evidence, and the experience of friends and family. There were free text responses where
192 respondents could elaborate on why or why they had not made changes to management and leave
193 any other comments regarding the podcast.

194

195 The survey was piloted on 5 equine owners who were not listeners of the podcast and following
196 minor changes to response wording to facilitate understanding, the survey was made open from the
197 1st of October 2021 to the 1st of May 2022 and a link was made available on the podcast homepage
198 for listeners to access. In this period, 54 respondents engaged with the survey and all respondents
199 could be retained in the analysis. Participants had to be over the age of 18 to participate per the
200 consent statement at the beginning of the survey. The survey was hosted on JISC Online Surveys.

201

202 *Data Analysis*

203 The quantitative data were analysed via R (R Team, 2021). To characterise demographic data the
204 tidyverse package (Wickham et al, 2019) was used to apply summary statistics and the Likert
205 package (Bryer & Speerschneider, 2016) was used to analyse Likert-like data. Where there was an
206 interest in the relationship between demographic variables and other responses, a Chi-Squared test
207 using the base R packages was used to characterise the associations. Free text data were imported

208 into NVivo 12 (NVivo, 2019) and read over by all authors. From this informed position, JM
 209 determined categories of interest within the comments based on the content of the research
 210 questions and JM’s understanding of human behavioural change literature. The content analysis per
 211 Silverman’s (2014) definition, therefore, comes from a constructionist epistemology (Charmaz,
 212 2008).

213

214 **Results**

215 *Who listens to an equine podcast?*

216 The majority of listeners were female (93%), with listeners between the ages of 18 and 74. On
 217 average, listeners had 20.9 (+/- 13.0) years of experience with equines and the most frequently
 218 described themselves as horse owners (n = 21, 39%). The majority of respondents had completed a
 219 college or university degree either at undergrad or postgraduate levels (n = 35, 65%). A full
 220 breakdown of listener demographics is available in **Table 1**.

221

222 **Table 1:** *Breakdown of respondent age, years of experience managing equines, demographics, and*
 223 *education for 54 listeners of the Conversations in Equine Science podcast.*

Question	N Respondents	Percentage (%)
How would you describe your gender identity?		
Female	50	92.6
Male	4	7.4
What is your highest level of formal education?		
Completed a college or university degree (e.g. Bachelors, Honours, etc.	23	42.6
Completed a postgraduate qualification (e.g. MSc, PhD, PGDIP)	12	22.2
Some college or university education	10	18.5
Completed high school or secondary school	9	16.7

How would you describe your involvement in the equine industry?				
Horse owner			21	38.9
Rider			10	18.5
Service provider (vet, physiotherapist, farrier, etc.)			6	11.1
Other			5	9.3
Owner of an equine related business.			4	7.4
Barn/farm/racetrack employee			3	5.6
Barn owner			2	3.7
Horse lover/enthusiasts			2	3.7
Trainer			1	1.9
	Mean	Standard Deviation	Minimum	Maximum
Age	38.9	15.77	18	74
Years of Experience Managing Equines	20.9	13.05	3	55

224

225

226

227 *Engagement with and perceptions of podcast and evidence*

228 Most respondents engaged with the podcast at least once a week (59%) and considered that the
 229 podcast was mainly based on scientific evidence with some of the hosts' experience (82%). 78% of
 230 respondents had been prompted by an episode to read the paper referenced in that episode at least
 231 once. A summary of attitudes to the podcast are displayed in **Table 2**. There was no significant
 232 relationship between participants' highest level of formal education and frequency of referencing
 233 the paper in a Pearson's Chi-squared test ($\chi^2[6, n = 54] = 2.97, p = 0.812, \text{Table 3}$). 94% of
 234 respondents were likely to recommend the podcast to others.

235 Participants were asked how important it was to consider various forms of evidence when making a
 236 change to their horse's management or training (**Figure 1**). Interestingly, the experience of
 237 veterinarians and scientific evidence were considered the most important forms of evidence (93%

238 and 91% respectively) whereas the experience of a coach or instructor, those on the yard, and the
 239 respondent's friends and family were generally considered least important.

240

241 **Table 2:** Respondent (*n* = 54) perspectives on evidence in edutainment podcast 'Conversations in
 242 *Equine Science (CES)*'

Question	n	Percentage (%)
How often do you, on average, listen to CES		
At least once a week	27	50.0
Several times a month but less than weekly	14	25.9
Less often than once a month	6	11.1
Several times a week	5	9.3
At least once a month	2	3.7
How would describe the podcast's approach to scientific evidence versus the hosts' experience?		
The podcast is wholly based on scientific evidence	0	0
The podcast is mainly based on scientific evidence with some of the hosts' experience	44	81.5
The podcast is split between scientific evidence and the hosts' experience	9	16.7
The podcast is mainly based on the hosts' experience and some scientific evidence	1	1.9
The podcast is wholly based on the hosts' experience	0	0
Has any CES episode prompted you to read the paper referenced in the episode?		
Yes, more than once	27	50.0
Yes, at least once	15	27.8
No, never	12	22.2

243

244 **Table 3:** Association between participants (n = 54) primary source seeking behaviour and levels of
 245 education in a χ^2 test ($\chi^2[6, n = 54] = 2.97, p = 0.812$)

Has any CES episode prompted you to read the paper referenced in the episode?	Level of education completed (n)			
	High school or secondary school	Some college or university	Completed college or university degree	Completed a postgraduate qualification
Yes, more than once	1	3	6	2
Yes, at least once	3	1	7	4
No, never	5	6	10	6

246

247 **Figure 1:** Listener ratings of the importance of considering various forms of evidence when making
 248 choices regarding equine management, respondents are 54 listeners of the Conversations in Equine
 249 Science podcast.

250

251 *Changes to equine management*

252 74% of respondents (n = 40) had made a change to the management or training principles prompted
253 by an episode of CES. Of these, the majority (55%) had done so based on a joint discussion of the
254 podcast and their reading of the evidence (**Figure 2**). The vast majority (98%, n = 39) were happy
255 with the change they had made, with the remaining respondent 'partly' happy with the change they
256 had made. Of those who did not make a change (n=14), 29% did not currently manage their own
257 horses, and 57% were happy with their horses' management. One respondent was interested in
258 making changes but felt they had to research further.

259

260 **Figure 2:** *Respondents' process for making changes to an aspect of equine management and/or*
261 *training after listening to Conversations in Equine Science Podcast*

262

263 *Listener free-text data*

264 Out of 54 respondents, 23 left free text explanations on the changes they implemented and the
265 reasons why. The researcher-identified themes within the data were the social context surrounding
266 making informed changes to equine management (16 references), the listener utilizing multiple
267 sources of evidence to make changes (3 references) and the financial implications of management
268 change (1 reference).

269

270 In keeping with Abraham et al's (2009) perspective on behavioural change, the social context of the
271 decision-making was frequently referenced in respondent's consideration of their management
272 changes. Participants would highlight the positive subjective experience of listening to conversations
273 and how this helped them to parse information or come to new understandings.

274

275 *I love the presentation of info, but I would love to see some more follow-up on the impact*
276 *upon equine industries and cultural norms. – Respondent 8 (Is there anything else you would*
277 *like to tell us about the podcast?)*

278

279 *The group talked about pressure, release (reward) and patterns. I never heard training*
280 *principles explained like this. It has opened up a whole new world for me and my horses. –*
281 *Respondent 51 (If you like you can elaborate more on your behavioural change)*

282

283 *I always enjoy the conversation. - Respondent 21 (Is there anything else you would like to*
284 *tell us about the podcast?)*

285

286 Some respondents were able to identify how they had passed information through their own social
287 networks to impact greater behavioural change.

288

289 *When jockeys use whips, it may increase the number of strides per minute but it decreases*
290 *stride length. I do believe this can make a difference between a win or a second-place finish. I*
291 *coach my jockeys to not overuse the whip. – Respondent 20 (If you like you can elaborate*
292 *more on your behavioural change)*

293

294 *Helpful in communicating with my teenage daughter and her friends for having a science-*
295 *based tool for reading their horses, rather than just an opinion on the horses' expressions. –*
296 *Respondent 8 (If you like you can elaborate more on your behavioural change)*

297

298 Respondents also discussed the range of sources they utilise to make decisions. Interestingly, this
299 was typically referenced in terms of seeking out the primary literature or vague references to
300 'research'.

301

302 *The research papers sometimes seem to be written in a foreign language. I'm glad Kate and*
303 *Nancy discuss them, that helps me to understand the process better. – Respondent 22 (Is*
304 *there anything else you would like to tell us about the podcast?)*

305

306 *Changing boarding barns. I had been thinking about it and this episode, along with other*
307 *research, confirmed my thoughts – Respondent 39 (If you like you can elaborate more on*
308 *your behavioural change)*

309

310 *I researched further into the topics to question if I'm doing the best by my horses. I am highly*
311 *fascinated by equine-related science and recognise that even very small changes can affect*
312 *these animals. There were some areas in these episodes that I decided I could implement in*
313 *my daily practices. – Respondent 46 (If you like you can elaborate more on your behavioural*
314 *change)*

315

316 While only one respondent highlighted the financial impacts of change-making behaviour, we felt
317 this was an important aspect to highlight within the data. In this participant's case, they felt they had
318 been 'throwing money down the drain' by excessive supplement use (Respondent 26). The impact of
319 financial incentives is a debated aspect of behavioural change literature (Hoskins et al., 2019), but

320 we do know that financial barriers are often a barrier to change in equine management (Pritchard et
321 al., 2018), so it is interesting to note that the financial saving was highlighted.

322

323 **Discussion**

324 In this study, we invited listeners to an equine-related edutainment podcast to describe any changes
325 they had made to the management of their equines in order to better understand the role
326 edutainment can play in the welfare of equines. Here we discuss the findings and limitations of this
327 work.

328

329 *Who listens to CES and what is its reach?*

330 According to a recent survey by the Pew Research Center (2021), podcast audiences have been
331 steadily increasing since 2008 (Auxier & Anderson, 2021). In addition to being popular, research has
332 found that listening to information via podcast can result in greater levels of physiological arousal
333 compared to reading text on a website (Turner-McGrievy et al., 2013). However, few studies have
334 been conducted on science-based podcast listenership and, in particular, whether or not these
335 podcasts have the ability to elicit change.

336

337 The CES demographics, as recorded by the hosting service Anchor, reflect a female listenership of
338 92.6%. A high female audience could be representative of the higher number of female horse
339 owners, (Fenner et al., 2019) in a gender analysis of the human-horse dyad, reported on 1,233
340 survey respondents with 94% of these respondents identifying as female. According to a survey
341 conducted by the American Horse Council in 2017, approximately 79% of horse owners in the United
342 States are female (AHCF, 2017). In Europe, 74% of horse owners/riders are reportedly female (BETA,
343 2019) and in developing countries, 66% of working equid owners are women. While males are

344 considered less likely to respond to surveys, this has not borne true in meta-analyses of response
345 bias (Wu et al., 2022). Podcast listenership varies by age, but research shows that it is most popular
346 among people aged 18-44 years old (Edison Research, 2021). The majority of listeners in this study
347 reported being between the ages of 18 and 74 years of age. According to the Edison Research
348 InfiniteDial 2021 report, 52% of people aged 12-34 years old and 44% of people aged 35-54 years
349 old, listen to podcasts monthly. Meanwhile, only 22% of people aged 55 years and older listen to
350 podcasts monthly (Edison Research, 2021). The CES demographics reflect close to the same numbers
351 with 90% of listeners being between the ages of 23 to 59 years of age. Of those, 25% are older,
352 between the ages of 44 -59 years old (Spotify for Podcasters, 2023). Most respondents, 65% in this
353 study, had completed a college or university degree either at undergrad or postgraduate levels.
354 There have been various studies on the relationship between education level and podcast listening.
355 A 2019 survey by Edison Research found that higher levels of education were positively associated
356 with podcast listening. Additionally, some science podcasts may be geared towards individuals with
357 more specialized knowledge or interests in scientific fields, which may appeal more to those with
358 higher education levels. Overall, the sample in this study may be considered broadly representative
359 of the listening population, although the population itself is a particular subset of equine owners.

360

361 *Social Context of Behavioural Change*

362 In the field of human behaviour, health and medicine, Kelly & Barker (2016) list six common errors in
363 policymakers' attempts to change individual behaviours in relation to public health drives:

- 364 1. A belief that changes are 'common sense'.
- 365 2. A belief that individuals do not know the right 'message'.
- 366 3. A belief that knowledge and information drive individual behaviour,
- 367 4. A belief that people act entirely rationally.

368 5. A belief that people act irrationally.

369 6. A belief that it is possible to accurately predict behaviour.

370

371 Often the reason why individuals do not change practice is not because they have a knowledge
372 deficit, but instead, there are social and psychological factors impacting choices and those factors
373 are not always obvious.

374

375 Kelly & Barker highlight that traditional medical models often frame the doctor as the expert and the
376 patient as ignorant of cases, but many times this is not the case, particularly where the patient has
377 chronic care issues that they deal with daily (Kelly & Barker, 2016). It is fair to assume that a similar
378 model of information flow exists from the veterinarian to the client in traditional veterinary
379 relationships. Social support from peers is commonly found to be one of the few positive mediators
380 of behavioural change in public health (Van Achterberg et al., 2011). CES attempts to introduce the
381 listener to open-access research papers in a relaxed and conversational manner, providing social
382 support to the acts of accessing and acting on information. This was a prevalent theme within the
383 free text data. Notably, 78% of respondents had read the paper referenced in an episode at least
384 once prompted by the episode. As there was no relationship between education level and the
385 likelihood of seeking out the paper, this appears to be a global effect within the sample. Additionally,
386 these were not readers who had reviewed the paper prior to the podcast episode, suggesting that
387 this may have a considerable impact on the dissemination of veterinary research within these
388 listeners. The majority of respondents reported that the experience of veterinarians and scientific
389 evidence was considered the most important form of evidence, but they also valued their own
390 experience highly. This returns to the social context surrounding behavioural change and the
391 importance of recognizing the limitations in the information flow model of behavioural change.

392 Past research on livestock farmers in the UK has found that peer-reviewed research papers can be a
393 trusted and useful source of information when they are accessible. Accessibility is challenged when
394 the research is hard to find, and the scientific language within the papers makes them hard to
395 understand. Finding the research can be difficult and time-consuming however. The language (poor
396 communication format) can also be a barrier to reading the papers (Alarcon et al, 2014). Similarly,
397 93% of CES survey respondents felt that scientific peer-reviewed evidence was important to consider
398 (Figure 1). CES facilitates access to the papers by linking directly to the source on the podcast
399 homepage, and preferentially selecting open-access papers, removing time and financial barriers to
400 access. The podcast hosts then aim to discuss the paper in such a way as to overcome scientific
401 language barriers. In support of this interpretation, 74% of the survey respondents reportedly made
402 management changes due to listening to an episode of CES. Of these 74%, 55% made changes due to
403 a combination of hearing an episode and reading the research (Figure 2). Past studies on the Theory
404 of Planned Behaviour (TPB) and the Theory of Reasoned Action (TRA) confirm these concepts apply
405 to instances where farmers make changes in livestock management for better welfare of the animals
406 and for public safety (Klein et al 2023; Ellis-Ivercen et al 2009).

407 When supporting owners to make changes, veterinary professionals must be aware of the range of
408 information sources that owners draw from, and the role of social support. Edutainment such as
409 podcasts could be a route to support owners to provide good equine welfare. There is an important
410 caveat to this which will need to be considered in future work, however. It should be considered
411 though that these social relationships may be considered 'parasocial', i.e., a relationship that is
412 unidirectional and unequal in strength between a consumer of media and a media presenter (Giles,
413 2002). Parasocial relationships between podcast audiences and hosts have been found to contribute
414 to good well-being in the audience (Pavelko & Myrick, 2020), and are conducive to animal welfare
415 education (MacKay et al., 2018), but the impact of these relationships on both presenter and
416 audience should be considered in future work.

417

418 The majority of respondents engaged with the CES podcast at least once a week (59%) and
419 considered that the podcast was mainly based on scientific evidence with some of the hosts'
420 experience filtered in (82%). This level of engagement could be closely linked to the accessibility of
421 podcasts. As a communication tool, podcasts have become widely utilized and adopted in many
422 science communication scenarios. They are no longer just seen as an amateur practice but as an
423 important communication arena (Picardi & Regina, 2008). As stated earlier, audio as a medium is
424 considered a less formal, more engaging way of communicating about science than written material
425 and can be used to establish a more intimate connection with an audience (Merzagora, 2004).

426

427 Podcasts also offer the additional advantage over traditional radio of complete listener control,
428 meaning that not only are listeners engaged, but they are also able to choose to listen when and
429 where they please and replay segments of audio that they have missed or want to hear again. With
430 79% of people in the United States listening to podcasts on their smartphones (Edison Research,
431 2021), disseminating information has now become even more accessible.

432

433 As 74% of the respondents felt they had made a change to the management and/or training of their
434 horse as a result of listening to the podcast (often alongside additional research), the podcast could
435 be considered a reasonably effective behavioural change intervention. Many complex and
436 multifactorial interventions show no impact on human behaviour (Baird et al., 2014; Blue et al.,
437 2016), and while we are unable to say whether these changes were a) improvement to the welfare
438 of the equine or b) maintained over time, the relatively low cost and simplicity of the edutainment
439 approach are worth more extensive investigation in future research.

440

441 *Study Limitations and Biases*

442 There are several limitations to this study. First, the participants are entirely self-selecting from a
443 limited pool of those listeners of the podcast. The study aims were not concealed from participants,
444 and it is possible that listeners who do not make changes to their horses' management may not have
445 responded. The respondents are also limited to a pool of listeners from one podcast only. However,
446 this survey is not intended to be representative of all listeners, but instead to characterise how some
447 listeners may use the podcast to change their behaviours and to establish whether it is possible for
448 edutainment sources to be a potential route for animal welfare-related behavioural change. While
449 we queried respondents on what changes they made and whether they were happy with their
450 changes, we were not able to establish whether the changes were successful or in the best interests
451 of the animal in this work. We encourage readers to consider this work highly preliminary but
452 suggest that future work in the communication of equine veterinary medicine take note of the value
453 that engaged equine owners place on scientific evidence, and consider what resources can be made
454 available to combat accessibility challenges, be that facilitating discussion of papers through one-to-
455 one interactions, given participant's ratings of their veterinary professional's opinion, or directing
456 owners to appropriate edutainment sources. These results demonstrate an appetite for accessible
457 scientific materials, and suggest that they may make a difference in equine management. Further
458 work exploring the process of behavioural change in greater detail will support equine welfare. This
459 area would greatly benefit from a greater variety of studies, including experimental trials to
460 determine the extent, strength, and persistence of any behavioural change. This study may provide
461 some justification for that work.

462

463 **Conclusion**

464 While more research is needed in this area of science podcasting to improve animal welfare,
465 podcasts can be viewed as a form of (potentially parasocial) social support. Edutainment podcasts

466 may therefore act as a social mediator, supporting equine owners to make use of the evidence and
467 enact change to the management and/or training of their equines. This can help them provide better
468 care aimed at the ethological needs of the horse and make more informed decisions when it comes
469 to their horse's health, training, and overall welfare. Science podcasts can help horse owners to be
470 aware and understand the latest research trends and advancements in equine health, behaviour,
471 and management. By listening to podcasts that cover topics related to horse care, owners can gain
472 valuable knowledge that can help them better understand their horse's needs and behaviours. This
473 could potentially help them provide better care by enabling them to make more informed decisions
474 when it comes to their horse's welfare.
