Nanometric size seems to be a key parameter for fast rate lithium ion and electrochemical capacitors. In a earlier work¹, we reported the electrochemical properties of a nanosized form of lithium ferrite, prepared by a simple and cost-saving method. Nanosized α -LiFeO₂ provided an interesting capacity of 160 mAh·g⁻¹ under C/4. In the present communication, we have extended its use to electrochemical supercapacitors using neutral sulphate electrolytes in order to build enviromentally friendly devices². The results obtained indicate that the nanomaterial performs quite well as an capacitor electrode when a 0.5M Li₂SO₄ aqueous solution is used as electrolyte.

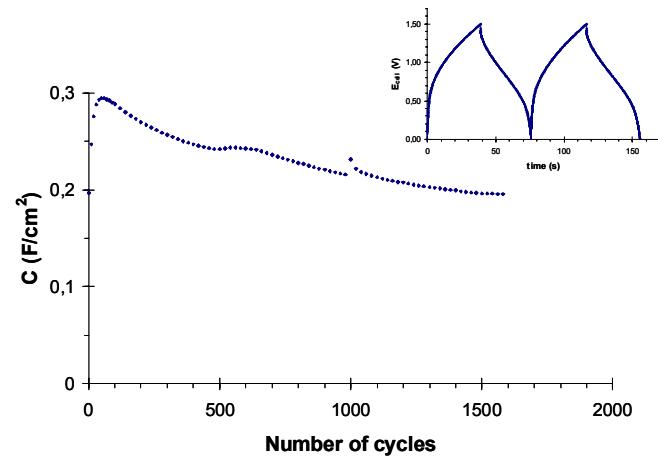

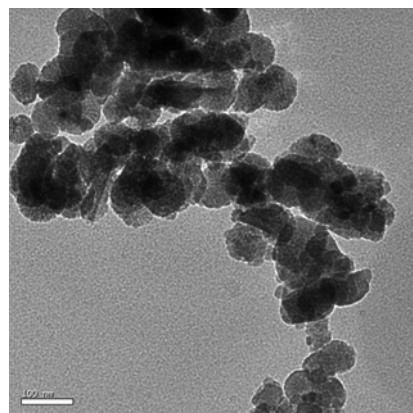

Figure 1. HRTEM image of nanosized α -LiFeO₂. **Figure 2.** Capacitance of the cell asymmetric White bar corresponds to 100 nm.
Figure 3. Cyclic voltammogram of the cell α -LiFeO₂/0.5M Li₂SO₄/MnO₂ as a function

of cycle number. Voltage range: 0–1.5 V, $j = 5$ mA·cm⁻². Inset corresponds to the first two voltage/time profiles.
