

## SHELTER FROM THE STORM: ISSUES AND TRENDS FOR COLLECTION DEVELOPMENT IN A DIGITAL TYPHOON

Stephen Pugh

### The Landscape: Digital and Print

It's been raining for a very long time. In the past twenty years, I have worked with over 90 universities, their librarians, academics and researchers in designing, creating and maintaining collection development structures like approval profiles, retrospective projects, opening day collections and the like. In all that time, the rain has not relented. Ten years ago, Steve O'Connor and I wrote a paper delivered to an ARL conference in Atlanta called "*Collaborative Purchasing: a Model for Financially Straitened Times*".<sup>1</sup> In it we described the woeful and declining state of English language monograph purchasing by libraries and discussed practical solutions, such as shared and consortia profiling, to combat, or at least mitigate, the looming financial and intimidating structural causes of the crisis.

These are tough times, but "*In tough times, a librarian is a terrible thing to waste*", says Marilyn Johnson in her wonderful new book, "*This book is overdue!: How Librarians and Cybrarians Can Save Us All*".<sup>2</sup> Those of us who have grown accustomed to bibliographic hand-wringing will take comfort and have our self-esteem raised to dangerous levels from her entertaining look at the indispensable role of librarians in the digital age. She *is* singing in the rain.

However, the facts are still sobering and the storm is approaching typhoon proportions. The percentage of English language monographs, serials and digital resources purchased by academic libraries worldwide is still diminishing. The cost of this material continues to increase as does the cost of its delivery—digital resources platforms and the metadata needed to populate and support them are most definitely not cheap. Library budgets are shrinking or remaining static. Increasing numbers of students and academic staff have created enormous pressures on libraries. For example, some universities in Australia have increased student numbers by over 50% in the past fifteen years without concomitant funding. CAUL, the Council of Australian University Libraries, in their Statement of the Global Economic Crisis of April last year, made a number of predictions including a contraction of libraries for the foreseeable future, unpredictable exchange rates, movement toward high-use collections, more outsourcing to vendors, uncertainty around long-term commitments and an acceleration of the move toward electronic resources.<sup>3</sup>

In the United States, the situation is much the same. Both public and academic libraries are seeing huge increases in patron use as the economic downturn leads its victims to access employment resources found in libraries and go back to school to improve their chances in the shockingly bad job market. The Association of Research Libraries (ARL) has looked at issues and trends in scholarly communication and published an environmental scan called *Transformational Times*. In it, the ARL reports that nearly all members will be cutting journals, databases and other content acquisitions which will cause new stresses on the publishing industry. They, too, are hampered by long-term journal bundle commitments and are predicting more serial cancellation spirals. They predict more dire consequences for the print monograph and increased movement toward digital resources. The ARL identifies small publishers and members of scholarly societies as potential casualties of these trends and urges, without any specific recommendations, that new kinds of educational outreach be created to help them.<sup>4</sup>

What can librarians, publishers and vendors do to cope with this typhoon?

*For twenty years a librarian named Jackie prayed every night to win the lottery. But night after endless night, Jackie's prayers went unanswered. Finally, Jackie could*

*take it no more and railed against perfidious fate and bad luck. "I am a deserving person! Why have my prayers not been answered? Why have I not won the lottery?" Expecting, as usual, to hear nothing, Jackie is instead startled by a booming voice in tardy reply, "Help me out, Jackie, buy a ticket".*

With abject apologies to both Bob Dylan and Gene Kelly, I hope this cursory look at the issues and trends in collection development might help discover whether we can buy our own lottery ticket and find some shelter from the storm. My intent is to stimulate discussion and to provide some modest food for thought regarding how collection development and selection principles, having chiefly evolved and been applied in a print environment, are being adapted to and integrated in the more lightly explored territories of relevant electronic, non-book and other non-traditional content. To say that the situation at present is fluid would be a huge understatement. The landscape that confronts us challenges us to examine our past practices and the tools we use in new ways.

Many academic and scholarly librarians have done an excellent job of imposing collection development discipline to their print collections. This discipline is largely informed by what is considered relevant combined with what is considered affordable. Professional collection development is an exercise that is not easily measured or reduced to a metric. It is the considered application of a body of expertise confined within a methodology. Successful methodologies, such as profiles and approval plans, are well-known in the Asia-Pacific region and throughout the world, and have been described and evaluated exhaustively in the literature. However, librarians often struggle with the integration of e-books, journals, subscriptions, AV material, web content, RSS feeds, podcasts, wikis, and other content within these traditional, and still useful, structures.

Though "interdisciplinary" is a term coined in the last century, it was Plato and a handful of other ancient philosophers who first argued that all knowledge is unified or integrated. He nominated the philosopher as the one best capable of synthesizing and unifying knowledge. This is increasingly recognized as self-evident by academic libraries. For example, the University of Hong Kong cites as its first collection development objective, "*To develop high quality, relevant and balanced collections that aim to support and strengthen teaching, learning, and research by providing information resources that are becoming increasingly diverse, non-traditional, and interdisciplinary*".<sup>5</sup> I don't claim to be a philosopher, but I do want to examine how this integration is evolving in the realm of library collection development and the building of unified collections. Scholarly libraries, as part of the wider university community, are reexamining their role, their goals, their strategies, and their purpose as never before. Collection development has a vital role to play in this process.

## **Consortia**

Current conditions have motivated many libraries to focus relentlessly on capturing as much digital publishing as possible through package deals offered by many publishers and aggregators—even if it means the homogenization of collections or access, and the diminution of other, more peripheral, resources. We are advised to consider the unintended consequences to the basic library function of collection development.

Over the past fifteen years, the emergence of consortia in the academic market worldwide has been impressive. From OhioLink, the CIC and OCUL in North America, to ARLAC and WAGUL in Australia, to CONZULAC in New Zealand, to the geographically-based consortia in the UK, to the Singapore Polytechnics, academic libraries have sought to improve discount with their vendors by defining and controlling market share. The hapless vendors were given no choice but to deal with these new giants on giants' own terms. The result has been a sharp increase in discount to libraries and a shortening of vendor margins. Here in Hong Kong, HKMAC has been arguably the most successful of all in the print arena and the announcement last week regarding the Inter-Regional E-Book Consortium in China and in Hong Kong with MyiLibrary will no doubt set the bar even higher for digital material as well.

With the notable exception of OhioLink, which, among other things, provides incentives for its members to avoid duplication, the question of collection development has been largely

missing in this scenario. A year after writing that paper with Steve O'Connor, I gave a presentation at the Collaborative Collection Development Conference sponsored by CAVAL in Melbourne called, "*Beyond the Buying Club: New Strategies for Profiling and Collecting Relevant Content*", in which I argued that, having formed consortia, libraries should utilize the strategic advantage of these large combinations to impose rational decisions regarding the purchase of content and its distribution among the members. At the time, this didn't make much of an impression. However, in recent years the practice of collection development has undergone a bit of rehabilitation in some quarters.

## **The Big Deal**

On the digital side, the "Big Deal" or package buying has been influential for a considerable time. Historically, very little collection development methodology has been applied to these deals other than relatively crude criteria based on publisher and/or broad subject areas. For many libraries and consortial brokers such as CAUL in Australia, this is just fine. The CIC libraries in the United States report that they are happy with the big deals, can afford them, and see no need at present to apply a more refined collection development approach to their purchasing.

Others have had a different view for some time. Librarians have long complained that they have no control over the content of these deals and that they often lack current content. Speaking six years ago at the 24th Annual Charleston Conference, Stanford University Librarian, Michael Keller, provocatively assailed the practice. He urged more collecting of books, maps, music and other artifacts, called for the support of university presses, and raised concerns about open access—a seemingly unending and inexhaustible debate. Keller asserted that it was time for librarians to focus on paying "*for things we select rather than for things we just settle on.*"<sup>6</sup>

In Australia, the importance of collections was reinforced a few years ago with the creation of the Collections Council of Australia to represent the shared interests of archives, galleries, libraries and museums. Among its terms of reference are to advance the stability and sustainability of the collections sector and promote benchmarks and standards for the care and management of collections. Sadly, the CCA lost its funding from the Cultural Ministers Council in October 2009.<sup>7</sup>

## **Defining Collection Development**

Collection building assumes that the library supports both the research requirements of its academics and the core needs of its undergraduate and post-graduate students. Regrettably, many libraries do not have the luxury of time, money and the expertise on staff required to build these collections. Subject bibliography is a conscious, measured and informed building of collections in discrete disciplines, but is seen less and less outside of the very largest research libraries. Some librarians report they are able to devote as little as 5% of their time in collection building activities. Despite this, they are burdened with impossibly broad titles such as Humanities Bibliographer, Science Liaison, or Social Sciences Selector. Many complain that their administrators do not value review and selection as it is not easily measured, benchmarked or otherwise statistically defined except in the most useless of ways—raw title numbers. Ideally, collection building is a collaborative and painstaking title-by-title enterprise whose benefits are, like oxygen, invisible but absolutely vital to our culture. As a professional pursuit it has a great deal of appeal to many librarians, but on a day-to-day basis, it is often pushed aside or abandoned entirely in favor of other priorities.

When unmediated by trained collection development librarians, the effect on library purchasing and collections can be profound. For example, when left to academics alone, collections are often very deep in those research areas that interest individual academics, but very shallow elsewhere. This is seen in its most extreme form in the lack of support for core undergraduate material—an area where the print or digital monograph is just as important as it ever was. Too often, librarians viewed this as either something they could do little about, or something that didn't matter enough when compared with other priorities.

In the last ten years, libraries throughout the world have become increasingly dependent on supplier methodologies to support both their selection and acquisition work—in all formats. This has meant abandoning old ways of doing business and the arms length relationship that too often characterized the library/supplier relationship in the past. It is frequently a component of the library's attempt to re-define its role or lift its profile within the larger academy. The emergence of true approval plans, collection evaluation, and other collection development constructs in recent years in the regions where they were previously absent is testament to this. To reference but four of numerous examples:

- Recognizing this reality, ALIA gave Bruce Munro and Peter Philips of the University of New South Wales the first YBP Research Award in 2006 for their project "*Bibliographer vs. Academic: Who is Responsible for Academic Library Collection Management?*";
- In New Zealand, Margaret Ferguson and Emma Shepheard-Walwyn of the Victoria University of Wellington are conducting 10 fully subscribed workshops on collection development next month. They are looking at policy and procedures, but also at working with suppliers;
- Here in Hong Kong, Steve Ching and Diana Chan of the City University of Hong Kong did a presentation on the Cooperative Collection Development of Electronic Books in Hong Kong: a Jurisdictional Approach and the work of ERALL and JULAC have been described quite well in this forum's predecessor, and;
- A little over a year ago, Zhao Yan of the National Science Library of the Chinese Academy of Sciences conducted a workshop on the CAS's Development of Digital Resources in which, among other things, he discussed e-collection development and the consolidation of print resources.

### **Profiling Methodologies**

Carving is one of the oldest sculptural techniques. It is a subtractive process; starting with a solid block, the sculptor removes material using chisels and other tools to reveal the finished form. Profiling is very similar. Successful profiles are best described by what they deselect. Done correctly and evaluated regularly, what remains after the application of this subtractive process is the bibliographic residue—the content of most useful or interesting to the institution. Ideally, this is a collaborative process where the selectors' instructions regarding subject, press, format, etc. inform the vendors' structural methodologies. Modern profiles are themselves a product of the librarian as selector or bibliographer model of discovery and acquisition. They can only completely flower where a shared understanding of bibliography, description, publishing and classification are present. Like Hong Kong's Bauhinia flower, profiles can only be cultivated; they don't produce their own seed.

During the great North American vendor wars of the late 20<sup>th</sup> and early 21<sup>st</sup> centuries, the print approval plan was the coveted prize. Many academic libraries spent up to 80% of their monographic budget on approval books and ancillary services. The emergence of the large consortia made this prize even more attractive—and critical to win. The three chief outcomes of these wars were a steep increase in discount given to libraries and consortia (HKMAC being a leading example), a huge investment in development of web-based interfaces and related workflow support, and a massive development and enhancement effort around profiling methodologies. Librarians demanded that these methodologies be precise, nuanced, comprehensive, predictable, cheap, and seamlessly supported by web-based databases and cataloguing metadata. Some vendors rose to the challenge, others did not.

As academic libraries move more and more of their acquisition and access purchasing toward digital resources, those that want to maintain collection development discipline over their collections correctly ask if profiling methodologies developed for print can usefully be modified for digital and other objects. When stretched beyond their historical use, some of these profiling methodologies are showing a bit of wear and revealing their structural limitations; others have vanished. For those still standing, their underlying architecture is now going on 20 years old or more and is perhaps pushing the limits of capacity.

The sheer amount of digital communication, much of it stubbornly resistant to the application of traditional metadata and methods of description, is daunting. One of the hallmarks of approval profiles has always been the timely receipt of profiled titles or notification of wanted titles immediately upon their publication. Timeliness and currency remain important factors in satisfying users and in streamlining library workflow. However, very few publishers produce their print and digital analogs simultaneously. Often the digital version follows months, or even years, later—after the print book is out-of-print. Do libraries wait for the e-book or do they buy the available print version? Vendors, used to selling precision, now grapple with how to accommodate the nuance wanted by selectors without the “book-in-hand” to which they are accustomed. For material that is “born digital” the problem is compounded. Profiling has an important role to play in identifying this material and in making it discoverable to researchers and archivists, but the basic structure of vendors’ methodologies has to be flexible enough to accommodate major change.

## Digital Content and Collection Development

Speaking last June on Radio National’s The Book Show during the Australian Book Association meeting, David Taylor, President of Lightning Source, a leader in the print-on-demand market, declared that “...*the future of the book is very healthy*”.<sup>8</sup> Robert Darnton, in his excellent monograph, *The Case for Books* (which is available on Kindle), champions libraries and books, stressing that “...*we cannot reduce our acquisitions of printed monographs until we have solved a great many problems, above all the problem of preserving digital texts.*”<sup>9</sup>

Before looking at the issues and trends for collection development with respect to digital content, it is worth considering that even STM publishers derived only 10% of their sales from e-books in 2009. Yet most scholarly publishers now have to have both print and digital infrastructures. Some are going it alone while others are turning to third-parties to outsource some of this work. The printed book is not yet dead, but it is on life support in academic and scholarly libraries. As a consequence, the business models that publishers and vendors have reliably used over the years are now under unsustainable pressure.

The Primary Research Group’s *Library Use of E-Books 2008-2009 Edition*, provides a useful context for our current, or at least recent, e-book purchasing environment:<sup>10</sup>

- A mean increase of spending of 36% between 2006 and 2008 from US\$19,340 to US\$26,290.
- Mean spending for 2009 of another 13.6% to date
- The rate of increase for the largest libraries (over US\$4 million budget) is slowing, while the rate of increase for medium-sized libraries and small libraries has been an impressive 53.3% and 52% respectively
- Nearly 70% of e-book spending by these libraries was with vendors/aggregators, while nearly 25% was spent directly with publishers.
- Non-US libraries in the survey showed the most dramatic increase of all—90% between 2006 and 2009.

The Primary Research Group has also published *The Survey of American College Students: Student Use of Library E-book Collections*<sup>11</sup>, which provides some food for thought as well. Surveying a sample of US university students, they discovered:

- 30.42% of the students in the sample say that they have received any form of in or out of class training from a college librarian in how to use the library’s e-book collection.
- Only a sixth of students in colleges with a mean SAT score greater than 1950 say that they have received e-book collection training from college librarians.
- Less than 17% of community college students found library e-book collections useful or very useful.
- Students in the Western [US] states were the most likely to be frequent e-book users.
- Close to a third of the students in the sample were not sure what an e-book was and another 9.5% believed that their library did not have an e-book collection.

- It was the middle to upper-middle level college (in terms of SAT acceptance scores) that accounted for the highest percentage of e-book frequent users.

So, in practice, how are libraries buying e-books? Academic libraries now employ four basic approaches for purchasing e-books. Each has its ramifications for collection development. The first and oldest method is the package or big deals offered by publishers and vendors. These are relatively cheap to purchase on a per book basis, but can be duplicative across a library or consortium and usually feature very little in the way of professional collection development. A broad subject package doesn't count. The use of e-books by patrons purchased in packages is also relatively low.

The second method is title-by-title purchasing. It is expensive when compared to package deals, but is controlled by a collection development discipline imposed by selectors similar to that of print material. This method is often guided by existing print collection development policies like the one at Nanyang Technological University whose policy mission reads in part, "*Develop and build a wide-range and in-depth print collection according to prescribed intensity levels.*"<sup>12</sup> In general, titles acquired in this way have greater patron use than those from packages.

In recent years, we have observed a great variety of patron-driven methods of acquiring e-books. Typically, e-book access, supplied by aggregators, is provided in the library's catalogue and titles are purchased based on "hits" or use of the titles. Seminal work was done on this method by Swinburne University in Australia and documented in an article by Gary Hardy and Tony Davies called "*Letting the patrons choose - using EBL as a method for unmediated acquisition of ebook materials*"<sup>13</sup>. In subsequent practice, however, the need for some mediation was painfully evident as budgets were blown out and inappropriate material was purchased. That mediation is governed in the first instance by controls and caps on spending for these projects and in the second instance by the application of collection development principles or profiling in defining the scope and nature of the titles eligible for purchase. The advantage for libraries is that, by definition, all titles selected and acquired are used by patrons.

The fourth method is the most recent and, as yet unproven, and brings collection development full circle—the e-book approval plan. Efforts are underway at Arizona State University and a few other places to see if approval methodologies, given the challenges I described earlier, can cope with e-books. If they can, e-book purchasing will be cheaper, more easily distributed across libraries or members of a consortium, and strictly controlled by collection development discipline. Indeed, the patron-driven models under development could also be encompassed in an e-book approval plan by incorporating profiled access to e-book titles in lieu of purchase or by making e-metadata available to selectors and users as an outcome of the vendor's profiling process.

### **Vendors, Suppliers and Aggregators**

Library collection development is now so intertwined with vendors, suppliers, aggregators and third-parties such as bibliographic utilities that it could define the word symbiotic. A dizzyingly vast amount of opinion has been expressed over the years suggesting that libraries are "cutting a stick to beat themselves with" in demanding more and more of their vendors—particularly with regard to price and value-added services. Vendor margins are now razor thin. Yet they still find themselves in the middle—squeezed on one side by the demands of publishers and on the other by the increasing needs and expectations of their library customers. Some vendors have disappeared or been absorbed. A few survivors have taken on massive debt in chasing the market share that will enable them to achieve new economies of scale and fight on. Others are playing a more tactical and reactive game by positioning themselves to quickly take advantage of market factors, new technologies and opportunities when they appear. Others still are simply floundering and hoping to hang on a while longer. More than ever, libraries need to take an approach of enlightened self-interest to the partnerships they form with vendors. If they do, they can significantly influence the research and development that will define their collection development aspirations into the future.

Print-on-demand technologies hold great hope for publishers, vendors and libraries. For publishers it offers a new production and business model that solves the vexing question of how many copies to print. Too few and they lose sales when the title goes out-of-print, too many and they end up pulping books—a costly enterprise. Print-on-demand means that books are not printed unless they are sold. Publishers can simply provide a digital file instead of maintaining a warehouse and outsource the production and distribution to third parties.

For vendors, especially those with a global reach, print-on-demand has the potential to literally help them survive. Apart from the cost of the books themselves, the biggest cost to vendors is shipping—most commonly air freight to international destinations. If titles can instead be printed and shipped from local or regional facilities, the cost of shipping will be greatly reduced. One huge benefit to vendors and our planet is that the print-on-demand capability will greatly reduce the carbon footprint caused in global shipping.

For libraries, print-on-demand can mean that they can get printed books more quickly. Print-on-demand facilities, as warehouses of digital content, also have the potential to serve as a convenient solution to the question of how best to preserve local digital content.

The days of the “gentleperson” bookseller like John Secor, John Coutts or Miles Blackwell are rapidly shrinking to a vanishing point in our rear view mirrors. Many providers are now owned by private equity firms and are under pressure to increase value and show a profit large enough to quicken pulses among the venture capitalists on Wall Street, Silicon Valley and beyond. Others, chiefly publishers, are subsidiaries of public and private universities that labor under their own financial constraints and cautions. Increasingly, these commercial entities will seek to transfer this pressure to libraries in the form of reduced discounts, higher prices, additional fees and attenuated service. When HKMAC tenders again it will be confronted by a commercial landscape significantly different than the one it encountered in 2007. Librarians must provide the expertise needed to enable the best vendors to thrive and grow while making certain that their institutions enjoy the best value for money, the highest quality and the most comprehensive service possible.

Finally, librarians, as custodians of our culture, need to remain vocal in making their expectations known to vendors, publishers, aggregators, their larger academies, and their private and public funding bodies. World class collections are not created in a vacuum and they do not spring forth spontaneously. Writing in the journal, *Australian Academic & Research Libraries*, Herbert S. White laments, “*If faculty are totally ignorant about what happens in libraries and why unique talents are required, is it at least in large part because we have never told them?*”<sup>14</sup> Libraries need to first fully examine and then marshal their considerable talent and resources in support of a disciplined approach to digital collection development. The expertise and innovation that resides within libraries and the academics and researchers in the university needs to be recognized, nurtured, rewarded and practically employed.

*I am reminded of the story of a man on a sentimental journey of his home town for the first time since moving away 20 years before. He enjoyed a leisurely afternoon strolling around town, observing the many changes and noting the things that had stayed the same. Turning a corner, he noticed an old shoe repair shop and suddenly remembered that, shortly before moving away, he had taken a pair of shoes in to be repaired and that, in the confusion of his departure, had forgotten to pick them up. On a whim he entered the shop and was surprised to find that the same little old man he remembered was still behind the counter. To make a bit of conversation he mentioned that he had left his pair of shoes there 20 years before. “Were they black shoes?” the old cobbler wanted to know. “Yes, they were”, said the man. “Were they wingtips?” Amazed, the man could only reply, “Yes, they were”. “They’ll be ready Wednesday”, said the old cobbler turning away.*

If we push, our Wednesday will surely come.
