## ABSTRACT

Colombia's status as the largest cocaine producer in the world has prompted its government's strategies to combat drug trafficking. One of these strategies is to seize cocaine in the Colombian jurisdictional territory. The unintended consequences of this strategy on crime rates, particularly homicides, remain uncertain. Web scraping methods and big data tools were used to gather and construct a time series dataset on cocaine seizures from three distinct websites, while the homicides dataset was supplied by the Colombian Ministry of Defense (MDN). This study aims to investigate, from a quantitative standpoint, whether there is a link between cocaine seizures and homicides in the Colombian Pacific region, utilizing an exploratory data analysis (EDA) method and machine learning techniques. The study recognizes the constraints of the sample size and opts to reveal valuable insights through data analysis and modeling instead. Despite the constraints, two models were developed to partially explicate the significance of this correlation. The study's findings provide value for policymakers, military personnel, government officials, and academics, offering essential perspectives to devise improved policies and strategies to mitigate drug trafficking in the Colombian Pacific region without exacerbating homicide rates. Future research endeavors could consider expanding the sample size of the cocaine seizure time-series dataset to conduct a more robust correlation analysis.

## EXECUTIVE SUMMARY

Cocaine consumption affects both the individual's health and their surroundings. The use of cocaine has stimulating and addictive properties that affects the brain's limbic system (Nestler, 2005), similarly or more intensely than alcohol (Nutt et al., 2007), with its detrimental impacts extending beyond personal health to societal welfare (Wood et al., 1996). The proliferation of cocaine use in North America and Europe from the 1970s onwards resulted in the creation of various organizations aimed at gathering and evaluating information about cocaine's influence on public health and society, from different perspectives.

One of the perspectives to consider involves the relationship between cocaine and crime, which is the specific focus of this study. After analyzing a comprehensive collection of academic researches that investigated the multifaceted relationships between these two variables, there were two studies that found associations between cocaine seizures and homicides. While an examination of cocaine seizures in Jamaica uncovered a reverse relationship between seizures amounts and homicide rates (UNODC, 2012), Miron (2001) identified a direct connection. Furthermore, Millán-Quijano (2020) asserted that drug trafficking leads to a rise in homicides in Colombian areas linked to the illegal trade. The results of these investigations present a paradoxical situation and raise questions about the potential variations in the relationship between cocaine seizures and homicide rates in diverse geographical contexts.

Given this context, this research centers on addressing the identified knowledge gap concerning the influence of cocaine seizures in the Pacific area on homicides in the Colombian Pacific region, driven by its unique geographical and social conditions. The Colombian Pacific region's isolation, challenging terrain, and limited law enforcement presence have made it a significant corridor for drug trafficking (Salazar, 2010) and illegal armed group activities (Aschner & Montero, 2021). The inhabitants of the region face underdevelopment, poverty, and socio-political challenges (Galvis-Aponte et al., 2017), propelled by illegal activities such as drug trafficking (Guzmán & Sánchez, 2021). The Colombian Pacific region is the primary global producer of coca bushes UNODC-

SIMCI (2022) and exhibits a higher homicide rates compared to the rest of the country (Álvarez & González, 2012).

To explore the relationship between cocaine seizures and homicides in the Colombian Pacific region, this thesis proposes a quantitative approach, employing a correlational design (Creswell, 2012). Although causal claims are not possible due to the limitations of the correlational design (Asamoah, 2014), the research seeks to provide insights between the variables. To achieve this purpose, data analysis and modeling processes imply the use of big data tools, advanced regression methods, and machine learning techniques.

To undertake the analysis and modeling of the variables, two datasets were necessary. The first dataset encompasses information concerning cocaine seizures in both the Pacific sea and land environments. To construct this dataset, big data tools were employed to extract news about cocaine seizures from three specific websites. A comprehensive procedure was carried out to select an appropriate web scraping tool, considering technical, ethical, and legal aspects. Most of the scraped data was derived from news articles published between 2012 and 2022, thereby defining the research's temporal scope. After scrapping, this data was stored in Hadoop and underwent processing in Hive, followed by a subsequent filtering procedure using Excel. On the other hand, the second dataset contains data about homicide rates in the Colombian Pacific region from 2012 to 2022. This dataset was provided by the Colombian Ministry of Defense (MDN) (MDN-ODHDN, 2023).

After exploring different combinations between the dependent and independent variables, two distinct alternative hypotheses were formulated based on the outcomes of regression analysis. The two findings suggest that large cocaine seizures in the Pacific area have an influence on the emergence of a high-intensity homicide rate in the Colombian Pacific region, becoming evident two and six days after the seizures, respectively.

A new filtering, exploring, and modeling procedure was done on these two alternative hypotheses to fit better models. Using the graph builder tool in JMP, a hands-

on exploration was conducted to redefine the cocaine seizures limits for both datasets derived from the alternative hypotheses. Enhancing the precision of these two models involved applying a least squares analysis, excluding outliers, to minimize disparities and uncover the optimal alignment between the variables. At the end two improved models were obtained and used for profiling, simulation, and prediction purposes.

For the first model, the statistical examination results in a high significant p-value  $<0.0001$ . Furthermore, the cubic fit model results demonstrate its effectiveness by accounting for 80% of the variability in homicide rates exceeding eight within the Colombian Pacific region. This variability is attributed to instances of cocaine seizures surpassing 750 kg, which occur in the Pacific area two days prior.

Regarding the second model, the statistical examination results in a high significant p-value  $<0.0011$ . Also, this cubic model applied demonstrates its effectiveness by accounting for 52% of the variability in homicide rates exceeding nine within the Colombian Pacific region. This variability is attributed to instances of cocaine seizures surpassing 545 kg, which occur in the Pacific area six days before.

These results suggest that large cocaine seizures in the Pacific area might have an influence in the homicide rates in the Colombian Pacific region. Hence, there is a need to balance anti-drug trafficking strategies to achieve immediate benefits while avoiding unintentional escalation of violence in Colombia. Persistent oversight of these strategies and vigilant scrutiny of homicide rates within their operational domains hold significant importance. Short-term successes should encourage coca growers to engage in sustained government programs for lasting results, requiring consistent commitment regardless of political changes.

Although the limitations of the models stem from difficulties in obtaining comprehensive international cocaine seizure data due to technical, ethical, and legal constraints, authorities struggling with cocaine trafficking issues should undertake future research on this correlation. In doing that, international collaboration is vital, but efforts must be carefully designed to avoid unintended consequences. Future research could expand sample sizes, analyze the impact of interdiction efforts on homicide rates in

bordering territories, or consider qualitative studies to validate findings and gain deeper insights from the real-world situation in the Colombian Pacific region.

## ACKNOWLEDGMENTS

My life has gained fresh energy during these two years at the Naval Postgraduate School, accompanied by a range of emotions. On one hand, I received somber news from home regarding my aunt's passing due to cancer. On the other side, I've been fortunate to experience this incredible country with my family and engage in its culture, particularly in such a peaceful and inspiring place like Monterey. Handling these emotions would have been a challenging endeavor without the support of my loving wife and amazing son. I am deeply grateful to Malu and Matias for their infinite love.

I want to thank God as well as my parents, Samuel and Alba, for granting me the opportunity to exist in this world; to my siblings, Erick and Lorena, along with other family members, for helping to mold my character to confront the challenges of life; to all the people who, in one way or another, have contributed to my professional development; and to the Colombian Navy and the U.S. Naval Mission in Colombia for having placed their trust in me to reach new frontiers of knowledge that I will use for the benefit of our institutions and countries.

I would like to extend my heartfelt thanks to everyone who supported me throughout my journey in both the administrative and academic aspects at NPS. I'm grateful to my U.S. sponsor LT Morgan White for her warm welcome and support; the International Graduate Program Office, especially Ms. Kathy Noyes for her unwavering dedication, and Ms. Martha Brumback for her invaluable assistance in enhancing my English language skills. My appreciation also goes out to the teams at Dudley Knox Library and the Graduate Writing Center for their outstanding support and commitment, with special recognition for Jasmine Mally, my writing coach. I am thankful for all the professors I had the privilege to interact with, and I want to highlight Prof. Mustafa Canan and Prof. Richard Bergin for their willingness and guidance as my thesis advisor and co-advisor.

I want to thank the United Nations Office on Drugs and Crime office in Colombia, especially CN (RA) Jorge Torres, for their support and interest in my thesis

topic. Also, I want to express my gratitude to the Human Rights and National Defense Observatory of the Ministry of Defense of Colombia for facilitating access to their databases for the development of my thesis.

Finally, I want to pour out my heartfelt appreciation to all those whose quiet support enriched my journey at NPS, in La Mesa, amidst the charm of Monterey, within the beauty of California, and across the vast expanse of the U.S. Your contributions have not only made our time immensely enjoyable and memorable, but have also played an instrumental part in turning the cherished dream of pursuing a master's degree at this esteemed institution into a reality I hold close to my heart. Thank you.

# I. INTRODUCTION

## A. BACKGROUND

Since 1997, Colombia has been the largest cocaine producer in the world (Rincón-Ruiz & Kallis, 2013). Recently, the U.S. Department of State estimated a global coca cultivation to be around 358,100 hectares, with Colombia as the main producer, at 65%, approximately (U.S. Department of State [DOS], 2021). The last United Nations' (UN) report on coca bush cultivation in Colombia estimated 204,000 hectares in 2021, up 43% from the year before (United Nations Office on Drugs and Crime [UNODC], 2023).

In 2016, the Colombian government and the Revolutionary Armed Forces-People's Army (FARC-EP) came to a consensus to resolve their internal conflict. As part of this agreement, both parties pledged to address problems associated with narcotics (Gobierno de la República de Colombia, 2016). Consequently, the Colombian government enacted the program for the substitution of illicit crops (PNIS), involving affected communities in collaborative plans (Ministerio del Interior de la República de Colombia, 2017). This approach is in line with the concept of establishing a viable government in the impacted territories, which is seen as a more effective long-term solution (Isacson, 2018).

Nevertheless, PNIS' report No. 24 recorded only 37,941 hectares of coca crops voluntarily eradicated as of July 2022 (UNODC, 2022a). The government is making slow progress in implementing the voluntary crop substitution strategy, yet new coca crops are proliferating (UNODC, 2022b). Furthermore, there has been a notable increase of 481% in the number of murders of social leaders who participated in substitution programs and actively opposed the expansion of illicit crops (Marín Llanes, 2022). This disparity calls attention to whether other strategies such as intensifying drug interdiction efforts, apprehending drug lords, blocking financial flows, or even implementing forced eradication, should be reinforced to diminish cocaine production. Although the government has implemented different law enforcement strategies, forced eradication might not be effective either due to the balloon effect (Dávalos & Morales, 2022).

Additionally, Castro (2017) claimed that the State was weak in most of the Colombian territory, leaving control to illegal armed groups. This seems to be particularly true in the Colombian Pacific region, where criminal activity is significantly elevated, with 29% of the municipalities experiencing a persistent high rate of homicides, particularly in the Valle department (Álvarez & González, 2012). The Colombian Pacific is a region isolated by the Western Ranges, with a complex river network and a wide coastline. Apart from its distinctive geographical conditions, the prevalence of high illiteracy rates, inadequate infrastructure, and limited formal job opportunities have fueled the increase in illegal activities, plunging the region into a cycle of poverty, violence, marginalization, and inequality (Galvis-Aponte et al., 2017) (Aschner & Montero, 2021).

Indeed, the Pacific Ocean is still considered a high flow volume cocaine smuggling route from Colombia to the U.S. (UNODC, 2023). Besides, the Colombian Pacific region holds the top position in terms of coca bush cultivation, making a substantial contribution of 44%, mainly in the Nariño department (UNODC-Integrated Illicit Crop Monitoring System [SIMCI], 2022). Consequently, this has led also to a rise in violence in Ecuador, as local gangs engage in fierce competition to secure their position within the criminal drug distribution network (Charles, 2022).

For now, the Colombian government has stated their intention of protecting coca bush producers and continuing the voluntary crop substitution process, while increasing intelligence capabilities and drug interdiction operations (Semana, 2022). In that sense, Guerrero Castro (2017) asserted on how the human and technical intelligence resources of the Colombian Navy (ARC) have helped increase the success of maritime drug interdiction operations. Also, Morselli and Petit (2007) revealed how intelligence gathering could be used to disrupt drug trafficking networks and understand their ability to reorganize after a seize-but-do-not-arrest strategy.

Although the unprecedented cocaine seizures during the last years in Colombia (LLC, 2023), Europe (LLC, 2022), and even West Africa (SyndiGate Media, 2022) has prevented the arrival of cocaine in the black market, it is crucial to recognize that these seizures could also result in a higher level of criminality. Disruptions to drug trafficking

networks by law enforcement may provoke retaliatory actions and collateral damage (LSE IDEAS, The London School of Economics and Political Science, 2014). While the increase in intelligence capabilities seems to be wise, interdiction operations in regions like the Colombian Pacific, where illegal armed groups maintain a firm grip on the cocaine trade, could potentially lead to a surge in homicides (Godoy, 2018).

In conclusion, the continuing presence of illegal armed groups, added to the unsatisfied needs of the population, have shaped the Colombian Pacific region as the ideal scenario for the production and distribution of cocaine. Also, the flourishing illegal cocaine business in this area has allowed authorities to seize more cocaine than any other region in Colombia. High level of seizures raises doubts about its potential correlation with the high annual homicide rates, suggesting a possible retaliatory response by drug trafficking networks following law enforcement disruptions. Therefore, this study has a limited scope, focusing solely on the examination of the issue in the Colombian Pacific region, due to its distinctive socio-geographical circumstances that separate it from other regions of the country.

## **B. STATEMENT OF THE PROBLEM**

The problem is that it is not clear how cocaine seizures influence/correlate with criminality when the cocaine trafficking logistic chain is broken. If the correlation is positive, homicides rate would increase as authorities seize more cocaine. This might be a problem, because the government's actions to stop cocaine trafficking could inadvertently affect crime rate.

As an example, visualize what is happening with homicides in the Colombian Pacific after the ARC seizes 1 ton of cocaine on the sea. Also, picture what is happening when the police seize 100 kg of cocaine in a municipality. Are homicides increasing because of the action of the authorities in these areas?

## **C. RELEVANCE OF STUDY FOR AUDIENCES**

Different audiences can benefit from this study, such as policymakers, military, government, and academics. Certainly, policymakers could use the link between cocaine

seizures and homicides to create better public policies. Likewise, military personnel could use it to plan strategies against cocaine trafficking while monitoring related crime. Additionally, government officials could implement policies and control the strategies, balancing the impact on homicides. Finally, academics and researchers could build upon this study, identify additional variables, generate new hypothesis, refer to the methodological process, or collaborate in the future. The collaboration can comprise from the verification process to the exchange of information for future studies in this field.

#### **D. PURPOSE OF THE STUDY**

The purpose of this study is to investigate if there is a correlation between cocaine seizures and homicides in the Colombian Pacific region. Studying this correlation can give insight into the effectiveness of the strategies against cocaine trafficking. Also, investigating this correlation could elicit new variables for shaping a more optimal set of policies in the future.

#### **E. RESEARCH QUESTION**

Do cocaine seizures in the Pacific cocaine trafficking flow influence/correlate with crime in the Colombian Pacific region?

## II. REVIEW OF THE LITERATURE

### A. THE COCAINE PROBLEM

Cocaine is an illicit drug known for its addictive nature and stimulating effects. Researchers have made significant progress in unraveling the process on the limbic system of the brain by which cocaine induces intoxication, cravings, and increased susceptibility to relapse (Nestler, 2005). Nutt, King, Saulsbury, and Blakemore (2007) classified cocaine as a class A drug, implying that the dependence, physical and social harm scores assigned by independent experts and psychiatrists were equal to or greater than those attributed to alcohol. The significant impact of cocaine extends beyond the individuals' health, negatively affecting the public health system and distorting the society (Wood, Mendelson, & Mello, 1996).

The use of cocaine has had rapid proliferation in North America and Europe since the 1970s. As a result, some institutions have emerged to evaluate and track the consequences of cocaine use on public health systems. During the 1980s, the U.S. Federal Drug Abuse Warning Network (D.A.W.N.) commenced its efforts to gather data related to cocaine, relying on statistics provided by medical facilities (National Institute on Drug Abuse, 1986). Later in the 1990s, the Canadian Community Epidemiology Network on Drug Use (CCENDU) was established to monitor drug use in major cities across Canada (Poulin, Fralick, Whunot, el-Guebaly, Kennedy, Bernstein, Boivin, & Rinehart, 1998).

Also, in the 1990s, the European Union created the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA) to gather and analyze information about drugs, addiction, and their consequences (European Monitoring Centre for Drugs and Drug Addiction, 1993). In contrast to the conventional perspective, the UN founded the Office on Drugs and Crime, which plays a crucial role in gathering global data on drug cultivation, trafficking, use, and treatment (UNODC, 1997). Likewise, the Australian Institute of Criminology implemented the Drug Use Monitoring in Australia (DUMA) program in 1999. This initiative focused on collecting data on drug use from police

detainees throughout the country, aiming to establish connections between drug use and criminal activities (Australian Institute of Criminology, 1999).

## **B. THE COCAINE AND CRIME RELATION**

Various studies have exposed the relationship between cocaine and crime. Desimone (2001) analyzed the correlation between cocaine prices and criminality in major cities across the U.S. during the 1980s and 1990s. The study elicited that higher cocaine prices corresponded to a reduction in demand and therefore crime. On this same path, Ferdinand, Blüm, and Verhulst (2001) found a strong association between delinquent behavior and drug use in male young adulthood. Another study in the U.S. found that the cocaine crack market emergence and the prevalence of firearms in African American communities could explain why the rate of homicides among black males was ten times higher than among white males (Evans, Garthwaite, & Moore, 2018). Also, Farber (2019) described how crack cocaine trade, dominated mostly by African Americans, generated a gang violence in U.S. during the 1980s and 1990s. These studies have shown a correlation between cocaine and crime in the U.S.

Other studies have shown the diverse dimensions of cocaine trafficking in Europe. Paoli, Greenfield, and Zoutendijk (2013) proposed a framework to analyze the challenges posed by cocaine trafficking in Belgium. This framework demonstrated significant associations of harm affecting individuals, institutions, and the environment. In contrast, Terenghi (2020) observed that the Italian cocaine market operates on trust-based interconnections among various entities such as families, ethnic groups, and work environments, reducing business risks and levels of violence when conflicts arise within the criminal network. This differs from the study conducted by Grassi and Sánchez-García (2021), which described a connection between cocaine and violence as portrayed in specific Italian rap lyrics, serving as a testimony to the experiences of marginalized communities.

Furthermore, cocaine use and its implications are examined in studies from the United Kingdom and Australia. In the United Kingdom (UK), a study on cocaine user-dealers concluded that these individuals found in the small trafficking a way to sustain

their consumption dependency instead of committing crimes to get money to buy drugs (Moyle & Coomber, 2015). Also in the UK, another research found that detainees testing positive for cocaine re-involved in minor crimes as prostitution and shoplifting (Pierce et al., 2015). Moving to Australia, an analysis of different data identified a correlation between the predominant increase in cocaine consumption with a rise in cocaine seizures, arrests, and related hospitalizations from 2003 to 2019 (Man et al., 2021).

Moreover, thorough investigations have shed light on the involvement of different states and regions in cocaine trafficking activities, emphasizing the reinforcement and expansion of distribution networks. For instance, Anastasijevic (2010) pointed out how cocaine trafficking was part of the organized crime in the Western Balkans countries during the first decade of this century, delaying their integration process into the European Union. Going south, Wehrey and Boukhars (2013) exposed the critical situation in Sahel and Sahara region after al-Qaeda in the Islamist Maghreb (AQIM) took control over Mali in 2012, organized crime and converted Mali in a cocaine hub for distribution towards Europe (p. 1-8). Besides, McCarthy-Jones (2018) advised about the emerging cocaine trafficking in the Indian Ocean region and the implications for Australia. In short, drug trafficking is no longer an isolated activity but a main component of organized crime (Reuter, 2014).

The dynamics of cocaine trafficking in Latin America reveal varying impacts of security policies and drug production on crime and violence. Ursin (2014) found that strong security policies reduced cocaine supply while crime remains on Brazilian streets. In contrast, Pfrimer and Motta (2021), based on cartography and literature review, demonstrated that there is a correlation between drug production and armed violence in Brazil. In Bolivia, since 2006, the presence of influential agricultural unions closely aligned with the government and their efforts to safeguard the interests of coca farmers in the Chapare region have effectively prevented the occurrence of high levels of violence that are commonly found in other drug-trafficking affected areas (Arias & Grisaffi, 2021). Nevertheless, in an attempt to gain control over cocaine trafficking routes, Brazilian criminal gangs have brought violence to the border regions of Bolivia (Ford, 2022).

Coca production and its associated challenges vary significantly across different countries in Latin America. For example, unlike Bolivia, where coca production is concentrated in the Yungas and Chapare regions, Peru has a minimum of 14 coca-growing valleys that are not well interconnected (Castillo Gallardo & Durand Guevara, 2008). On top of that, the main coca-growing areas in Peru were controlled by the insurgent group Sendero Luminoso, which deepened the society's criminal stigma towards coca growers (Durand-Ochoa, 2012; Morales, 2017). A similar situation but more complex was portrayed by Holmes, Amin Gutiérrez de Piñeres, and Curtin (2009) in Colombia, where guerrilla and paramilitary groups linked to cocaine trafficking plunged the country into a period of pervasive violence (p. 3-7).

The illegal cocaine trade serves as a concrete example of the resilience of a criminal network. Despite the dismantling of major Colombian cartels in the 1990s and the implementation of stringent security measures that significantly reduced cocaine production to historic lows in Colombia during the early 2000s (Thoumi, 2014), the trade persisted as smugglers adapted by fragmenting control into smaller trafficking groups (Echandía, 2013; Zuleta, 2022). These groups managed to sustain the business by assuming control of production and shifting the power dynamics to the Mexican cartels (Medel & Thoumi, 2014), who are now driving a new era of violence (Abi-Habib, Lopez, & Cegarra, 2022).

Also, some studies explained how force eradication policies such as aerial fumigation with glyphosates in Colombia failed because of the balloon effect (Rincón-Ruiz et al., 2022). The balloon effect refers to the phenomenon where the authorities' actions in eradicating coca crops in one area led to the displacement of crime and cultivation to other regions. Likewise, Toth and Mitchell (2018) argued how drug interdiction programs are ineffective as drug traffickers adapted by shifting their operations in time, space, and methodology to access consumer marketplaces.

Overall, the strategies employed by drug traffickers align with the dynamics explored by Duijn, Kashirin, and Sloom (2014) concerning the resilience of criminal cannabis networks after facing disruptions. This study revealed that despite the removal

of multiple actors, the impact on criminal activities was negligible, and surprisingly, the efficiency of the criminal network actually improved.

As per the UNODC, high volumes of cocaine flows persisted from Colombia, Peru, and Bolivia to Mexico, North America, Brazil, and Europe (UNODC, 2023) while moderate quantities have begun to make their way to Africa (SyndiGate Media, 2022), the Middle East (Matta Colorado, 2022a), and Oceania (Matta Colorado, 2022b). Additionally, the UNODC's findings between 2014 and 2019 indicated that while the number of cocaine seizures increased, cocaine production also rose, despite the notable efforts of global authorities (UNODC, 2021).

Other comprehensive studies have examined the associations between cocaine use and crime on a global scale. For example, Aziani (2020) provided evidence that fluctuations in the cocaine market value between 1998 and 2013 had a direct correlation with the intensity of violence in each of the 126 countries assessed. On the other hand, Jeynes (2022) carried out a meta-analysis of 75 studies that explored the potential association between drug consumption and academic and behavioral issues. The research findings suggested that drug use could be linked to challenges in academic performance and behavioral problems, as well as to violent behaviors towards others.

Perhaps, the study conducted by Miron (2001) is the most relevant research to the purpose of this thesis. His investigation highlighted violence as a prevalent way of resolving conflicts in the black market, holding that drug prohibition could increase it. This study also suggested a strong significance between cocaine base seizures and homicide rates between 1993 and 1996 in 66 countries, calling for further research using time-series data. In contrast, a case of study in Jamaica illustrated that between 2000 and 2011, as authorities seized less cocaine, the number of homicides increased (UNODC, 2012).

### **C. IDENTIFICATION OF COCAINE AND CRIME FACTORS**

Upon reviewing the available literature concerning the issue addressed in this thesis, it was evident that various factors related to cocaine have an impact on crime, as illustrated in Figure 1.

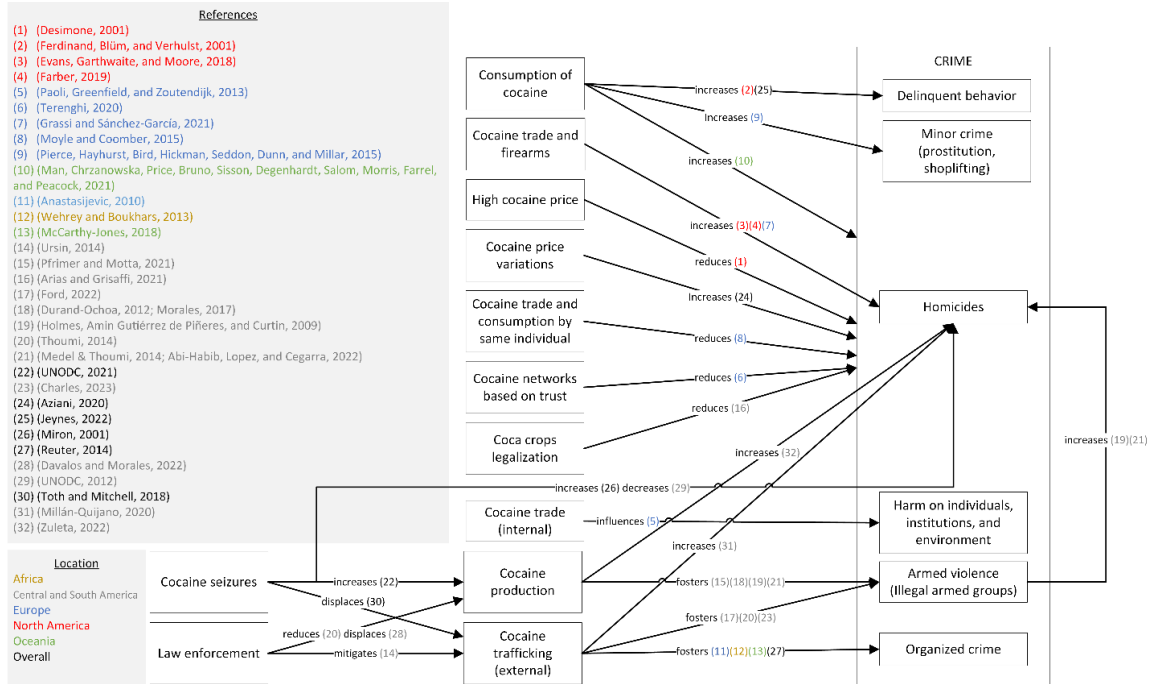

Figure 1. Cocaine factors associated to crime factors in literature review

The first cocaine factor, consumption, was found to have a positive relationship with delinquent behavior (Ferdinand et al., 2001; Jeynes, 2022), minor crimes (Pierce et al., 2015), and homicides (Man et al., 2021). The second factor, involving cocaine trade and firearms, showed a positive relationship with homicides (Evans et al., 2018; Farber, 2019; Grassi & Sánchez-García, 2021). Third, variations in prices were associated with an increase in criminality (Aziani, 2020), while high prices could reduce it (Desimone, 2001).

An intriguing fourth factor emerged when examining cases where the cocaine consumer also acted as a dealer, revealing a reduction in criminality within their area of influence (Moyle & Coomber, 2015). Similar findings were observed by Terenghi (2020) in Italy’s cocaine networks based on trust, as well as in Bolivia where the government legalized coca crops (Arias & Grisaffi, 2021). Alternatively, Paoli et al. (2013) presented a framework that established the connection between cocaine trade and the resulting harm to individuals, institutions, and the environment.

From the perspective of cocaine trafficking, there was evidence highlighting how law enforcement efforts could mitigate cocaine trafficking (Ursin, 2014). Furthermore, there was compelling evidence to support the conclusion that it fostered organized crime (Anastasijevic, 2010; Wehrey & Boukhars, 2013; Reuter, 2014; McCarthy-Jones, 2018), and, in certain instances, led to the formation of illegal armed groups (Thoumi, 2014; Charles, 2022; Ford, 2022). This armed violence contributed to the escalation of homicides rates in Colombia and Mexico (Holmes et al., 2009; Medel & Thoumi, 2014; Abi-Habib et al., 2022).

However, evidence suggests that while certain law enforcement strategies may show initial success, they eventually worsen the situation. For instance, force eradication has successfully reduced cocaine production in the targeted areas (Thoumi, 2014). Unfortunately, these strategies have also led to the balloon effect, resulting in the displacement of criminal activities to other regions (Dávalos & Morales, 2022). Likewise, the seizure of cocaine displaces cocaine trafficking activities (Toth & Mitchell, 2018) and has been shown to incentivize an increase in production (UNODC, 2021). Also, it was shown how cocaine production contributed to the strengthening of illegal armed groups in countries like Colombia, Mexico, and Peru (Holmes et al., 2009; Durand-Ochoa, 2012; Medel & Thoumi, 2014; Morales, 2017; Pfrimer & Motta, 2021) and increased the homicide rates in Colombia (Zuleta, 2022).

Withal, studies on the correlation between cocaine seizures and homicide rates yielded contradictory results. While a research investigation on cocaine seizures in Jamaica revealed an inverse correlation between the amount of seizures and homicides rates (UNODC, 2012), Miron (2001) found a direct relationship. Also, Millán-Quijano (2020) claimed that drug trafficking increases homicides in Colombian territories associated to the illicit business. The outcomes of these studies are paradoxical and prompt inquiries about how the connection between cocaine seizures and homicides rate might vary across different regions.

#### **D. COLOMBIAN PACIFIC REGION**

The divergent outcomes of these studies serve as a compelling rationale for narrowing the focus of this research to the Colombian Pacific region. The Colombian Pacific is a geographically distinct region, enclosed by the formidable barrier of the Western Ranges, which contributes to its relative isolation from the rest of Colombia. This isolation has given rise to a unique and diverse landscape, characterized by a complex river network and a vast, pristine coastline along the Pacific Ocean.

The Colombian Pacific is known to be a significant corridor for drug trafficking, with cocaine often being transported through rivers to reach coastal areas for further distribution (Salazar, 2010). The vast and dense rainforests, as well as the limited presence of law enforcement in some remote areas (Castro, 2017), create opportunities for illegal armed groups to use the territories for their illicit operations (Aschner & Montero, 2021). The region's challenging geographical features continue to pose challenges for law enforcement and counter-narcotics efforts.

Moreover, the inhabitants of the Colombian Pacific region have remained trapped in a state of underdevelopment. The low-income levels, elevated illiteracy rates, lack of infrastructure, and prevalence of illicit economic activities in the region has indeed acted as a significant barrier to social advancement (Galvis-Aponte et al., 2017). As well, Guzmán and Sánchez (2021) described how the centralism of power and the counterculture fostered by drug trafficking have significantly contributed to pushing the population of the Colombian Pacific region into a state of illegality. These factors collectively created a poverty trap that impedes the progress and development of the region and its population. (Galvis-Aponte et al., 2017).

Due to these specific socio-geographical conditions, the Colombian Pacific region has emerged as the primary producer of coca bushes not only in Colombia but also globally. According to the UNODC-SIMCI (2022) report in 2021, the Pacific region held the highest position among all regions in Colombia with the largest area dedicated to coca crops. It contributed 44% of the national total, amounting to 83,266 hectares. Once more, from an international standpoint, Colombia retained its position as the top coca bush

producer in the world in 2021, with a total of 204,300 hectares out of 296,600 hectares, representing around 69% of the global production (UNODC, 2023).

Furthermore, according to Hinestroza, Sánchez, Aidar, and Palloni (2021) life expectancy on the Colombian Pacific region is significantly lower compared to the rest of the country. This disparity in life expectancy might be indicative of armed group confrontations and the prevailing criminal activity within the region. On this regard, Álvarez and González (2012) concluded that the Colombian Pacific region is characterized as a violence cluster, exhibiting a persistent high rate of homicides in around 29% of its municipalities in 2000, 2003, and from 2005 to 2010.

The definition of crime might be wide-ranging and ambiguous, but it encompasses any activity connected to organized crime. A comprehensive definition of organized crime, as Paoli and Vander Beken (2014) proposed, is a transnational, dynamic structure engaged in illegal and profitable enterprises that infiltrate various government and societal institutions. This illegal penetration leads to the generation of a wide array of other criminal activities. In that sense, the UNODC (2008) has identified different kinds of crime associated with the illegal drug business, including gang violence, money laundering, corruption, kidnapping, and human trafficking.

Though, for the scope of this thesis, the focus will be on the homicide rate in the Colombian Pacific region between 2012 and 2022. Although homicide is not an exclusive measure of crime, it serves as a reliable indicator, as it is less influenced by inconsistencies in law enforcement definitions (Fox, 2000). Additionally, the Observatory for Human Rights and National Defense (ODHDN), under the MDN, diligently monitored homicide counts, encompassing various categories that aid in facilitating investigative efforts. The homicide counts experience minimal underreporting and contain detailed information regarding the date, location, modality, and victim characteristics (Ministerio de Defensa Nacional [MDN]-Observatorio de Derechos Humanos y Defensa Nacional [ODHDN], 2023).

## **E. DEFICIENCIES IN LITERATURE**

Literature evidenced some interesting relationships between law enforcement strategies and crime. For instance, research has revealed that the efforts of authorities can either lessen the impact of cocaine trafficking (Ursin, 2014), or lead to its relocation (Toth & Mitchell, 2018). Additionally, studies have shown that different kinds of law enforcement interventions can result in the displacement (Dávalos & Morales, 2022), reduction (Thoumi, 2014), or even escalation (UNODC, 2021) of cocaine production.

In turn, these shifts in cocaine production and trafficking have contributed to the growth of organized crime on a global scale (Anastasijevic, 2010; Wehrey & Boukhars, 2013; Reuter, 2014; McCarthy-Jones, 2018) , as well as an increase in armed violence within the countries where the drug is produced (Holmes et al., 2009; Durand-Ochoa, 2012; Medel & Thoumi, 2014; Morales, 2017; Pfrimer & Motta, 2021; Charles, 2022; Ford, 2022; Thoumi, 2014). The emergence of illegal armed groups has significantly escalated the homicide rates, particularly in countries like Colombia and Mexico (Holmes et al., 2009; Medel & Thoumi, 2014; Zuleta, 2022).

Certainly, these literary sources afford us a glimpse into how the actions of authorities, in line with government policies, disrupted the cocaine logistics, which in turn triggered a multitude of criminal activities. Notably, among these studies, only the investigations conducted by Miron (2001) and the UNODC (2012) specifically focused on the relationship between cocaine seizures (independent variable) and homicides (dependent variable), which are the main focus of the current thesis. Still, both studies arrived at contrasting findings.

The reasons for the disparities in conclusions could be attributed to various factors, such as differences in location, methodologies, data sources, sample sizes, time periods analyzed, and the specific contexts in which the studies were conducted. The disparities in findings underscore the importance of further research and analysis to gain a more comprehensive understanding of the dynamics between cocaine seizures and homicides.

For example, Miron's research in 2001 was broad, analyzing 66 countries to investigate the factors contributing to violence, considering drug prohibition and gun control in each nation. The study utilized cross-sectional data from the period between 1993 and 1996 to examine these relationships (Miron, 2001).

Conversely, the UNODC's study conducted in 2012 centered exclusively in Jamaica, relying on data from various U.S. agencies and governmental sources to estimate the levels of cocaine seizures and murders on the island between 2000 and 2011. This study provided historical insights into the return of Jamaican drug traffickers in the early 2000s and the successful measures implemented to curtail drug trafficking to Europe via air in 2002. Because of these actions, the study explained an upsurge in homicides on the streets of Jamaica (UNODC, 2012).

Hence, there is an important research gap in the existing literature when it comes to understanding how the cocaine seizures in the Pacific region influence the occurrence of homicides in the Colombian Pacific municipalities between 2012 and 2022. To fill this research gap, this study aims to use web scraping techniques to collect relevant news articles about cocaine seizures at sea and within the Colombian Pacific municipalities from available online sources. Furthermore, for data on homicides, the study will rely on the dataset made available by the ODHDN (MDN-ODHDN, 2023). Also, this study will implement Miron's suggestion of using a time-series dataset to explore the relationship between the variables of interest (Miron, 2001).

## **F. PHILOSOPHICAL WORLDVIEW**

This is a correlation analysis following a postpositivism worldview (Phillips & Burbules, 2000 p. 1-26). The goal is to find whether the cocaine seizure law enforcement strategy is correlating with the homicides rate in the Colombian Pacific region. To find out or verify a priori assumptions of the relationships between the variables, it would be necessary to establish operational definitions for each variable, specify the measurement scale, and identify the instruments required to obtain the results.

Even though this study lacks an empirical nature, the act of filtering the information retrieved through web scraping and the homicide database available (MDN-

ODHDN, 2023) does correspond to a reductionist procedure. Besides, during the exploratory data analysis, maintaining objectivity is crucial to ensure a valid and reliable process that can be replicated consistently once the study is concluded. Overall, the probabilistic determination, reductionism, and theory verification implicit in this thesis are postpositivist assumptions that are particularly applicable to quantitative research methods (Creswell, 2014 p. 6-8).

### **III. METHODS**

#### **A. TYPE OF RESEARCH DESIGN**

This thesis pertains to a quantitative study. According to Creswell (2014) a quantitative study should have a design that directs the investigation (p. 11-12). Furthermore, within the realm of quantitative studies, a correlational design, is employed to investigate the degree of association between two or more variables (Creswell, 2012). This quantitative study follows a correlational design to conduct an EDA of cocaine seizures and homicides datasets.

However, in a correlational design, controlling the independent variable is not feasible. As a consequence, it is not possible to establish a causal relationship but rather a correlational explanation (Covls & Schroeder, 2015). Yet, the correlational design is known to have two inherent issues: directionality and third variable. The first problem refers to the possibility that the relationship between the variables may be inverse. The second problem suggests that there might be a third variable influencing and explaining the correlation observed between the variables under analysis (Asamoah, 2014).

Considering these problems, the research will involve applying various advanced regression techniques to develop a model that explains the association between cocaine seizures and homicides in the Colombian Pacific region. However, due to the correlational design's limitations, the study does not claim any causal between the variables but aims to elicit subtle insights through data analysis and modeling.

#### **B. DATA COLLECTION AND PROCESSING INSTRUMENTS**

This thesis comprises the use of two distinct datasets. The first dataset contains information on cocaine seizures in the Pacific influence area, including sea and land. Gathering this data would require web scraping from various websites to access news related to cocaine seizures resulting from interdictions by navies in the Pacific Sea over the past decade. On the other hand, the second dataset pertains to homicides in the municipalities of the Colombian Pacific region and has been provided by the ODHDN (MDN-ODHDN, 2023).

This study used specific hardware and software setup. The hardware consisted of a personal Lenovo IdeaPad Gaming 3 15ACH6 laptop featuring an AMD Ryzen 5 5600H processor, a Radeon Graphics 3301MHz processor, 8GB of Random Access Memory (RAM), and a 500GB Solid-State Disk (SSD). The software tools were divided into three groups: an internet web browser, big data tools, and statistical data tools. All these applications were running on the Microsoft Windows 11 Home operating system (OS). Figure 2 shows a comprehensive overview of the hardware and software versions used in the study.

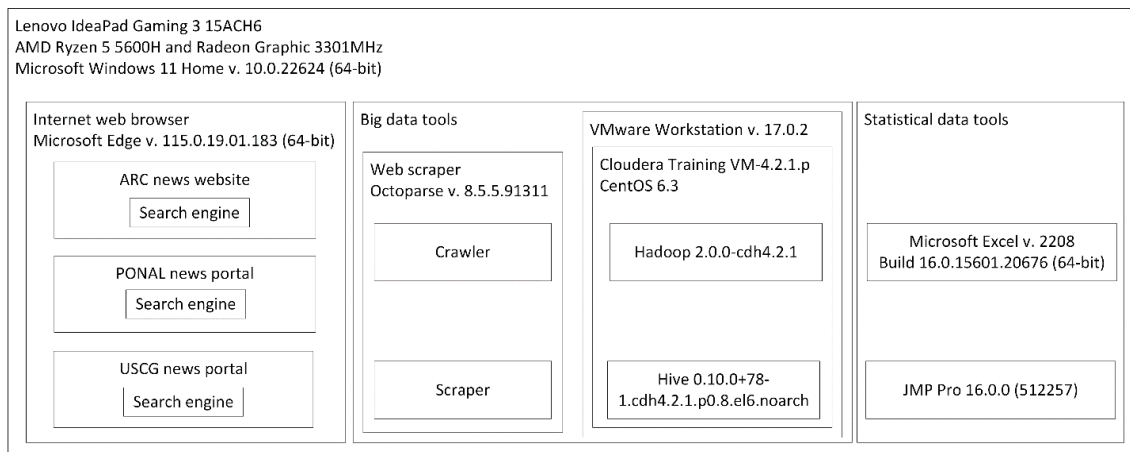

Figure 2. Data collection and processing instruments

### C. INTERNET WEB BROWSER

In this study, the Internet web browser Microsoft Edge was utilized. Within Microsoft Edge, three specific URLs were accessed for the research purposes: (a) ARC news website (ARC, 2022b), (b) PONAL news website (PONAL, 2023a), and (c) USCG external news website (Bright Mountain Media, 2022). All search queries were conducted using the search engine present on each respective website.

#### 1. Big Data Tools

This study made use of five big data tools. The initial one was Octoparse (Octopus Data Inc., 2023), employed as a web scraper to crawl websites and extract

information. The second software utilized was VMware Workstation (VMware, Inc., 2023), which served to virtualize the Cloudera Training virtual machine (VM). Within this virtual machine, the last three software pieces were installed, facilitating the operation of Hadoop and Hive applications on the CentOS operating system. The VMware Workstation used in the study was licensed by NPS, while the Cloudera Training VM was provided during the Big Data Management, Architecture, and Applications course at NPS.

Choosing Octoparse as the web scraping tool was a challenging endeavor. It involved a systematic process of exploration, testing, and decision-making. Throughout this process, various technical, legal, and ethical aspects were considered. Below is a comprehensive account of the process undertaken to make this selection.

## **2. Web Scraping Tools**

### ***a. Conceptual definition***

Every day, the internet experiences a heightened level of dynamism because of the consistent and enthusiastic generation of websites and web pages. According to Bitkoska (2022) approximately 252,000 new websites were generated daily in 2022, while Verisign (2022) reported an estimate of 115,555 new websites per day during the second quarter of that year. Considering that each website likely contains one web page with an average size of 2MB (Kang, 2022), the Internet's growth could be projected to exceed 231GB per day.

This continuous influx of new data added to the Internet presents challenges in obtaining reliable and valuable information for analysis and decision-making. As pointed out by Van Meter (2020), the growing availability of data on the Internet may lead to a higher amount of disinformation, which can be misleading (Shabani & Sokhn, 2018; Shao et al., 2018; Zollo & Quattrociochi, 2018; Di Sotto & Viviani, 2022). To tackle this issue, one potential solution involves the development of software designed to identify fake news on the Internet (Martens et al., 2018; Guess et al., 2019; Barua et al., 2019; Gaglani et al., 2020; Meddeb et al., 2022).

Another approach is to explore how users establish trust in websites, where factors such as service quality become significant in choosing retail websites, for example (Caruana and Ramaseshan, 2015). Likewise, for online news media, the quality of information plays a critical role in the selection process (Simanjuntak et al., 2022). By understanding the factors that influence user trust, it is feasible to enhance the user experience and improve the reliability of information amidst the vast and ever-growing volume of data on the Internet.

Having a trustable data source on the Internet is the initial and crucial step preceding the extraction and transformation of information. This idea has been present since the introduction of the Knowledge Discovery Database (KDD) model, which first phase involved carefully selecting data relevant to the topic of interest (Jaiswal and Patel, 2015). This principle remains relevant in the web scraping process proposed by Krotov and Silva (2018). In their approach, the first phase consisted in conducting a thorough analysis of the website's structure to ensure the data extracted is reliable and appropriate for the intended purpose.

Web scraping is consistently defined across various sources. The consensus among various researchers is that “web scraping is a technique used to extract data from websites and transform unstructured data into structured data” (Sirisuriya, 2015; Singrodia et al., 2019; Diouf et al., 2019). Zhao (2017) and Krotov and Silva (2018), similarly define web scraping as a method for gathering data and organizing it in a structured system to facilitate analysis. A web scraping tool comprises the use of a crawler and a scraper. A crawler is a program configured to navigate and download data from the Internet, while a scraper is a program to extract and transform the information of interest in structured data (Landers et al., 2016).

There are various web scraping techniques. In the study by Sirisuriya (2015) described some techniques from the fundamental “copy and paste” through more advanced methods. These included text wrapping, computer vision web page analysis, Hypertext Transfer Protocol (HTTP) programming, semantic annotation recognition, Hyper Text Markup Language (HTML) parsing, Document Object Model (DOM) parsing, vertical aggregation platforms, and web scraping software. Plus, Diouf et al.

(2019), included mimicry, weight measurement, differential, and machine learning approaches. On the other hand, Singrodia et al. (2019), named some other techniques such as syntactic web scraping, semantic web scraping, and computer vision web page analysis.

From all the techniques, the web scraping software was considered the simplest technique to implement (Sirisuriya, 2015). There are various options available in the market, including commercial and open-source. Diouf et al. (2019) classified these scrapers into two categories: ready-made tools and libraries for programming languages. The ready-made tools consist of web browser extensions and applications that users can readily employ for web scraping tasks. On the other hand, libraries developed for specific programming languages, such as Python (e.g., BeautifulSoup), Java (e.g., JSoup), and Node.js (e.g., Cheerio), can be configured for web scraping. Additionally, there are also frameworks, which serve as templates for creating new web scraping applications (Diouf et al., 2019).

#### ***b. Areas of application***

Web scraping tools have gained popularity and are now being applied in various fields. For instance, Mendels et al. (2015) used Jsoup to retrieve data from different multilingual websites to build interpolated language models for low resources languages to improve speech recognition and keyword search technologies. Singrodia et al. (2019) mentioned data mining, research, marketing, company competition, and data combination as typical areas of web scraping usage.

Web scrapers have been used also in different contexts. Krotov and Tennyson (2018) used a web scraper developed in the “R” programming language along with the Rvest and eXtensible Business Reporting Language (XBRL) packages to extract financial data from different websites for educational purposes. Similarly, Mackey et al. (2020) mined information about COVID-19 from Instagram using a web scraper developed in Python to detect and prevent misinformation during the pandemic. Lastly, Ponmaniraj et al. (2020) scraped Uniform Resource Locations (URL) from seeded web pages to test their reliability and freshness aimed at cybersecurity implementations.

Another typical application for web scraping is data mining from on-line news websites serving various purposes. As a case in point, News One used web scraping to gather the latest news from over 100 national and international news sources (Sundaramoorthy et al., 2017). In another example, Ertam (2018) employed a web scraping machine learning approach to extract information from a Turkish news agency, creating a repository of data. Similarly, ProCircle used web scraping to extract promotions from news websites and social media (Junjoewong et al., 2018). Moreover, Maududie et al. (2018) and Sarr et al. (2018) independently applied web scraping to structure the information from Indian and Senegalese news websites, respectively. did a similar application over 15 Senegalese news websites. Also, Pande et al. (2022) used web scraping implementing Natural Language Processing (NLP) to clean the text from news gathered from websites to later detect their fakeness.

Numerous research studies have demonstrated the utilization of web scraping tools for gathering data on drug-related subjects. For example, Giommoni and Gundur (2018) used a web scraper to collect data from the website [www.priceofweed.com](http://www.priceofweed.com), for their analysis of the cannabis market in the UK. A similar study conducted by Maybir and Chapman (2021) used a web scraping software, Scrape-Storm, to analyze the ecstasy's market trends. The EMCDDA also leveraged web scrapers with a machine learning approach to collect information from the internet for its projects eDrugTrends and CASSANDRA (Raubenheimer and Barratt, 2018). The U.S. National Institute of Health and National Institute on Drug Abuse (NIH/NIDA) supported the use of a similar technology in the eDarkTrends project to gather information from the dark net (Raubenheimer and Barratt, 2018). Plus, Li et al. (2019) went further building a web scraper in Python to characterize drug dealers on Instagram. Their research was extended to achieve an unsupervised machine learning approach model to scrape drug dealing comments from Instagram too (Shah et al., 2022).

Upon examining various domains where web scraping tools were applied, it becomes evident that one common practice is data mining digital news websites and extracting information from open sources to investigate illicit drug-related subjects. The successful application of web scraping techniques in previous studies, where data was

mined from digital news websites and gathered from open sources, serves as validation for its convenience as a valuable tool in collecting data on cocaine seizures for the current study.

*c. Legal and ethical considerations*

The use of web scraping tools can be limited by technical and legal factors. These might include the intricacy of the selected web scraping tool, legal restrictions set by website owners, and adherence to ethical principles during data collection from open sources on the Internet. An instance illustrating this challenge is attempting to use a web scraping tool on a website that explicitly forbids such activity.

Snell and Menaldo (2016) acknowledged the existence of a gray area in the legal domain. They identified five legal situations associated with web scraping: (a) copyright infringement, understood as an intellectual property violation as addressed in the Digital Millennium Copyright Act of 1998 (U.S. Copyright Office, 1998); (b) breach of contract, understood as the terms of use specified by the website owner (Dreyer & Stockton, 2013); (c) violation of the Computer Fraud and Abuse Act (CFAA), understood as the illegal use of the data scraped (Krotov & Silva, 2018), or the re-incidence in accessing to the website after the reception of a cease and desist letter (Snell & Menaldo, 2016); (d) trespass to chattels, understood as an unauthorized activity and consequent damage of the website's owner property (Goldman, 2013); and (e) hot news misappropriation, understood as the attribution of breaking news produced by other agencies (Snell & Menaldo, 2016).

There are some studies concerning the ethical field. Krotov and Silva (2018) identified three implications for the web scraping activity: (a) the unintended revelation of protected personal information (PPI) during the web scraping process; (b) the revelation of industrial secrets from organizations during the web scraping process (Ives & Krotov, 2006); and (c) the possibility of bypassing the commercial activity that supports the profit of the website owner during the web scraping activity (Hirschey, 2014). Figure 3 summarizes the ethical considerations and legal constraints.

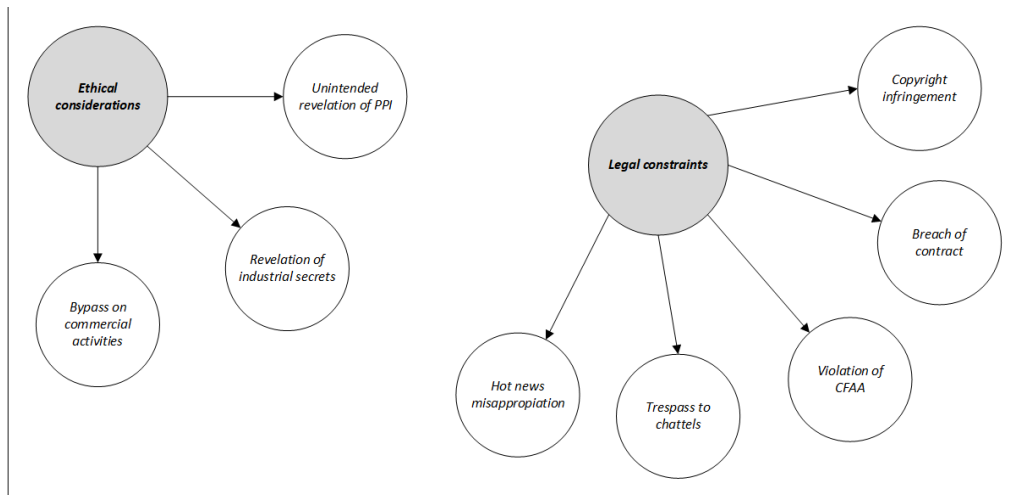

Figure 3. Ethical considerations and legal constraints of web scraping

Regarding the legal factors, Snell and Menaldo (2016) concluded that a website owner can improve the protection against web scraping activities in different ways: (a) addressing and forcing the recognition of the prohibition or limitation in using these technologies in the website’s terms of service/use; (b) implementing technological tools to avoid the use of the website by a machine; (c) protecting access to the website; and (d) managing the website content use through registers, licenses, or authorizations. Regarding the technological tools to avoid the use of the website by a machine, Zhao (2017) identified three major procedures: (a) HTML headers identification; (b) Internet Protocol (IP) reputation analysis; and (c) pattern behavior analysis.

In contrast, Krotov and Silva (2018) proposed a survey for the web scraping user before starting the activity to be sure that: (a) web scraping is allowed; (b) there are not copyrights on the website data; (c) the project is for legal and genuine purposes; (d) the activity will not damage any website owner’s property; (e) the extracted data will not reveal any personal private information nor any organizational secret; and (f) web scraping will not affect the organization’s profit for extracting data instead of accessing the website content.

Although the legal and ethical suggestions about the use of web scraping tools, the absence of a well-defined legal and ethical framework could present a challenge for the web scraping user. Taking all these factors into account can impact an individual’s

decision-making when it comes to using a web scraping tool for data collection. Some individuals may opt not to collect information due to the tool's complexity, concerns about potential legal violations, or adherence to ethical principles that discourage such actions.

This individual's dilemma might be related to the Theory of Planned Behavior (TPB) (Ajzen, 1991) and the Theory of Reasoned Action (TRA) (Ajzen & Fishbein, 1975). The beliefs and evaluations explored in the TRA appear to align with the individual's personal ethical considerations, while the subjective norm aligns with collective ethical considerations (Vallerand et al., 1992). Both factors play a significant role in shaping the individual's behavioral intentions as depicted in Figure 4.

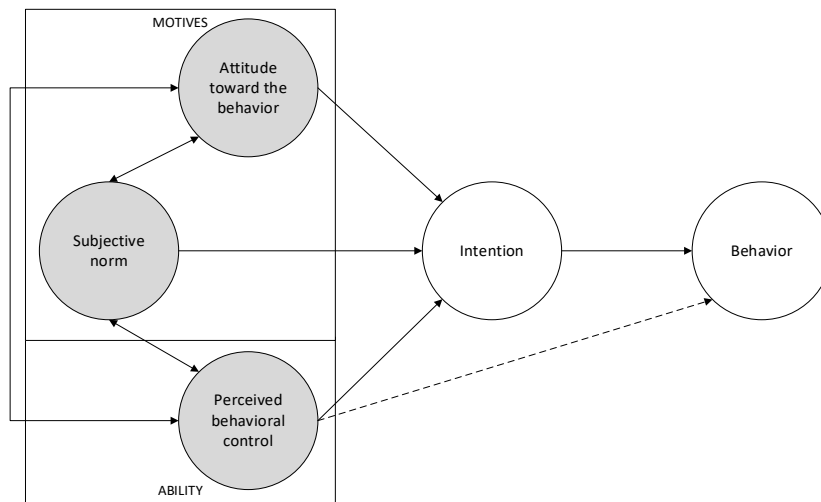

Figure 4. Theory of Planned Behavior. Source: Ajzen (1991).

Thus, the individual's ethical alignment with their organization might play a crucial role in determining their intended behavior. Despite the subjective norm influencing their behavior, the individual might choose to act based on their own beliefs, even if their attitude toward the behavior is negative. However, it is essential to note that mere alignment with ethical beliefs and external influences is not sufficient. The individual's ability to perform the behavior is equally vital, as it directly impacts the

likelihood of the intended behavior. Figure 5 depicts these new elements added to the TPB as a proposal to describe the user's behavior flow when scraping open websites.

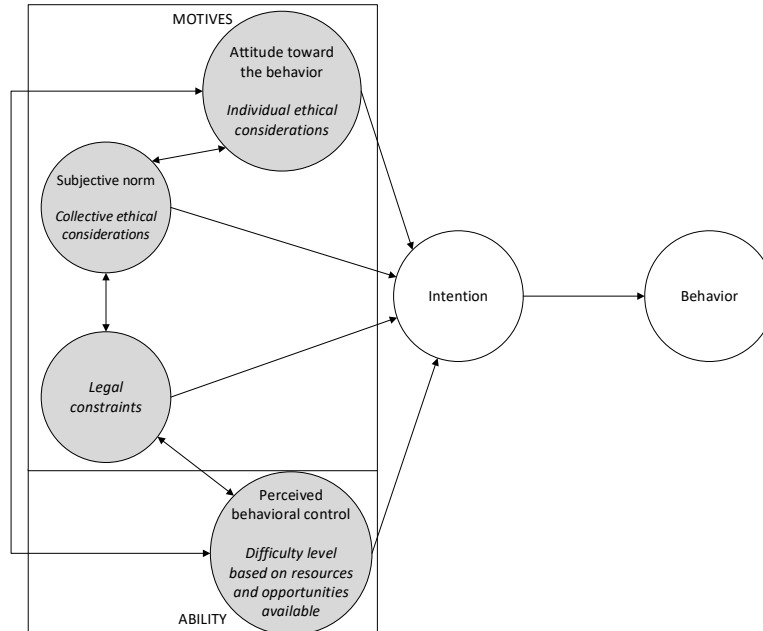

Figure 5. User's behavior flow when scraping open websites

Finally, formal collective and individual ethical guidelines will not be established for this thesis given that the open web encompasses websites accessible through standard browsers like Firefox, Chrome, or Edge. The websites targeted by this study must be in the open web domain without involving actions that bypass commercial activities, disclose PPI, or reveal trade secrets. Thus, web scraping the open web will be inherently regarded as both individually and collectively ethical by default.

#### *d. Identification of web scraping tools*

To identify the tools for web scraping used in previous researches, an exhaustive review of the literature related to this topic has been done. Table 1 shows a concise overview of reliable web scraping tools sourced from multiple academic papers

(Sirisuriya, 2015; Mendels et al., 2015; Milev, 2017; Zhao, 2017; Singrodia et al., 2019; Maybir and Chapman, 2021), including JMP<sup>1</sup> too.

Table 1. Identified commercial and open-source web scraping tools.

No.	Tool	Category		Trajectory	URL
		Commercial	Open-source		
1	80legs	X		2009-2022	<a href="https://80legs.com/">https://80legs.com/</a>

22	urllib2 Visual Web Ripper		X	1990-2020	<a href="https://docs.python.org/2/library/urllib2.html">https://docs.python.org/2/library/urllib2.html</a>
23	Content Grabber <sup>b</sup> Sequentum Enterprise <sup>b</sup>	X		2014-2022	<a href="https://www.contentgrabber.com/">https://www.contentgrabber.com/</a>
24	Visual Scraper	X		? <sup>d</sup>	<a href="http://www.visualscraper.com/">http://www.visualscraper.com/</a>
25	Web Content Extractor	X		2004-2022	<a href="https://www.newprosoft.com/">https://www.newprosoft.com/</a>
26	Web Scraper	X		2017-2022	<a href="https://webscraper.io/">https://webscraper.io/</a>
27	Webhose.io Webz.io <sup>c</sup>	X		2016-2022	<a href="https://webz.io/">https://webz.io/</a>
28	Web Sundew	X		2005-2022	<a href="https://websundew.io/">https://websundew.io/</a>
29	Zyte (Scrapy)		X	2008-2022	<a href="https://scrapy.org/">https://scrapy.org/</a>

<sup>a</sup> Scrapinghub evolved to Splash, an open-source project maintained by Zyte.

<sup>b</sup> Visual Web Ripper evolved to Content Grabber, and this in turn evolved to a commercial low-code web data extraction software called Sequentum Enterprise.

<sup>c</sup> Webhose.io evolved to Webz.io, a commercial software to transform web data into structured data feeds.

<sup>d</sup> Visual Scraper website is down. It was not possible to determine software trajectory in the market.

<sup>1</sup> JMP is a computer program for statistical analysis.

Upon identifying 29 web scraping tools, a filtering process was initiated based on their respective track records. Apart from Visual Scraper, which was discarded due to the unavailability of its website, the final year of support served as a determining factor to assess the obsolescence of each tool. Table 2 shows the available commercial tools, introducing a new attribute (modality of service), while Table 3 shows the available open-source tools, incorporating a new attribute (programming languages). These attributes were crucial for proceeding to the next filter phase.

Table 2. Available commercial web scraping tools.

No.	Tool	Trajectory	Modality of service			
			Application	Extension	Data collection	Web Application
1	80legs <sup>a</sup>	2009-2022				X
2	Dexi.io <sup>b</sup>	2015-2022				X
3	Helium Scraper	2010-2022	X			
4	Import.io	2012-2022			X	
5	JMP	1989-2022	X			
6	Mozenda <sup>b</sup>	2008-2022				X
7	Octoparse	2016-2022	X			
8	Parse Hub	2013-2022	X			
9	Scrape Storm	2019-2022	X			
10	Sequentum Enterprise <sup>c</sup>	2014-2022	X			
11	Web Content Extractor	2004-2022		X		
12	Web Scraper	2017-2022	X			
13	Webz.io	2016-2022			X	
14	Web Sundew	2005-2022	X			

<sup>a</sup> 80legs requires credit card information to access the web application. This alternative was discarded.

<sup>b</sup> Dexi.io and Mozenda.io are similar web scraping web applications developed by Dexi. For this study, Dexi will be tested.

<sup>c</sup> The price for an annual subscription to the “Starter” version of the Sequentum Enterprise tool is \$15,000. This price is out of budget; therefore, this alternative was discarded.

The available commercial web scraping tools were categorized into four modalities of service: (a) application, which refers to a desktop executable program compatible with operating systems like Windows 10/11; (b) extension, a small program running in the Chrome web browser (Google Developers, 2021); (c) data collection, a service where customers provide data requirements, and the company offers a quote for a customized solution; and (d) web application, an executable program accessible through a web browser and hosted on a remote server. Apart from 80 legs, Mozenda, and

Sequentum Enterprise (refer to Table 2 footnotes), the data collection options Import.io and Webz.io were excluded because a customized solution was unrealistic for the scope of this thesis.

Table 3. Available open-source web scraping tools.

No.	Tool	Trajectory	Programming language	
			Java	Python
1	Beautiful Soup	2004-2022		X
2	Heritrix	2004-2022	X	
3	jsoup	2009-2022	X	
4	Nutch	2004-2022	X	
5	Zyte (Splash) <sup>a</sup>	2007-2022	X	
6	Selenium	2004-2022	X	
7	Zyte (Scrapy) <sup>a</sup>	2008-2022		X

<sup>a</sup> Zyte is the company supporting the maintenance for Splash and Scrapy in two different programming languages.

The two programming languages used to collect data on the web with the identified open-source tools were Java and Python. The main difference between each open-source tool lies in how to manage a specific library, which still requires some programming knowledge in the Java or Python languages. Considering the author’s coding skills in Python, only one Python web scraping tool out of the two available was tested for this study. Scrapy (Zyte, 2022) was chosen over BeautifulSoup (Richardson, 2022) due to its better documentation, tutorials, and support on the Windows operating system.

Following an evaluation of the pricing information for each remaining commercial option listed in Table 2, Table 4 shows an overview of the final web scraping tools, both commercial and open-source options, selected for testing.

Table 4. Commercial and open-source web scraping tools for testing.

No.	Tool	Version	Price information	
			USD	Periodicity
1	Dexi.io	Intro	Quotation	Annual subscription
2	Helium Scraper	Basic	\$ 99.00	One-time fee
3	JMP	Pro 16	Free license in NPS	One-time fee
4	Octoparse	Standard	\$ 89.00	Monthly subscription
5	Parsehub	Standard	\$ 189.00	Monthly subscription
6	Scrape Storm	Professional	\$ 49.99	Monthly subscription
7	Web Content Extractor	Unique	\$ 70.00	One-time fee
8	Web Scraper <sup>a</sup>	Professional	\$ 100.00	Monthly subscription
9	Web Sundew	Standard	\$ 399.00	One-time fee
10	Scrapy (Python)	2.7.1	Free	One-time fee

<sup>a</sup> Web Scraper is a commercial extension for Chrome web browser.

*e. Websites to scrape*

Following the procedure to comply with legal constraints when scraping open websites, three websites were chosen. All align with the characteristics of the open web domain. The first website was the ARC news portal (Armada de Colombia [ARC], 2022). The second website was the open United States Coast Guard (USCG) news website, supported by Bright Mountain Media (2022). The third website was the Colombian Police (PONAL) news portal (Policía Nacional de Colombia [PONAL], 2023a). Appendixes A, B, and C provide the detailed terms of use, copyright, privacy, and access policies for all websites, respectively.

For the purpose of testing, the ARC and USCG news websites were selected. Web scraping tools were utilized, using the websites’ search engines, to find related news articles based on two search queries: (a) a search of the word *cocaína* in the ARC news portal (ARC, 2022); and (b) a search of the word *cocaine* in USCG (Bright Mountain Media, 2022). Appendixes D and E contain the anatomy of the ARC and USCG news websites at the first and second levels of scraping, respectively. For both cases, the scraping areas of interest to test were the titles, dates, and news content.

Both news websites presented different complexities during the scraping process. The ARC news website required a more complex crawling solution due to the presence of two-page iterations in both the first and second scraping levels. In contrast, the USCG news website case was simpler as it only involved one page iteration at the first scraping

level. To move from the first to the second level on the ARC website, it was necessary to extract the URLs of the titles to access and extract the corresponding news content.

The structure of both websites posed unique challenges when extracting the required information. For instance, each search webpage on the ARC news website had ten titles and dates, while the USCG search webpage had nine titles and dates. On the ARC news website, it was essential to extract dates in the first level of scraping because in certain cases, the date information was not accessible at the second scraping level.

Although the chosen web scraping tools were tested on both websites, variations in the results might occur due to variation in the testing conditions. Some of the web scraping tools were installed on virtual machines at the Naval Postgraduate School (NPS) servers, while others were installed on a personal laptop. As a result, minor discrepancies in time calculations arose due to network delays and disparities in computer processing capabilities.

#### *f. Testing of web scraping tools*

Before conducting the web scraping tool testing, it was crucial to establish the essential and additional features to evaluate the performance of each tool. The mandatory features are: (a) automatic scraping; (b) automatic crawling; and (c) deep scraping. Partial or complete failing of the mandatory features resulted in the tool's rejection. The optional features were: (a) level of complexity; (b) implementation time; (c) scraping time; (d) human behavior capabilities; (e) language fidelity; and (f) NPS network accessibility.

To establish a measurement, operationalization of the mandatory features is necessary. For example, for the automatic scraping feature, it means that the tool can systematically extract all titles, dates, and news content in a well-organized and logical manner from both websites. The automatic crawling feature implied that the tool could navigate to each web page indexed on the search page and effectively handle page iteration issues at the first scraping level. The scraping depth feature indicated that the tool could address the page iteration problem at the second scraping level and successfully extract the entire news content.

A similar process was undertaken for the optional features. The level of complexity was categorized into two groups: (a) code for open-source tools; and (b) graphic user interface (GUI) for commercial tools. Each category was further divided into three subcategories: easy, medium, and high. The easy subcategory scored three points when the total implementation time was 200 minutes or less. The medium subcategory scored two points when the total implementation time was between 200 and 400 minutes, inclusive. Lastly, the high subcategory scored one point when the total implementation time exceeded 400 minutes.

Moreover, the operationalization of total implementation and scraping times is required. Total implementation time encompassed the minutes spent attending tutorials and implementing the scraping solution for both news websites. On the other hand, scraping time referred to the minutes spent by the tool while scraping 100 web pages on the ARC news website and an additional 100 web pages on the USCG news website.

The human behavior capabilities operationalization involved three functions. Firstly, the assessment of IP address rotation, indicating the tool's ability to automatically change the IP for each new web page query, emulating different clients' actions on the server side, scored one point if present and zero if not. Secondly, the CAPTCHA solution was evaluated, scoring one point if the tool successfully solved CAPTCHA programs and zero if not. A sub-categorization of CAPTCHA solution was performed, with manual solution scoring one-point, partial solution (capable of solving image puzzles automatically) scoring two points, and automatic solution scoring three points. Lastly, tools equipped with a configurable fixed delay in milliseconds before scraping each web page received one point, while others scored zero.

Considering that the websites for this research were in Spanish or English, a language fidelity capability for each language was included. The Spanish language fidelity was divided into three subcategories: (a) low; (b) medium; and (c) high. A tool is classified in the low subcategory scored one point when the results showed HTML coding traces and weird codes to Spanish accents and/or punctuation. For medium subcategory, it scored two points when the results showed HTML coding traces or weird codes to Spanish accents and/or punctuation. Finally, for high subcategory, the tool

scored three points when the results were legible and sharp. The subcategorization for English was similar, with the exception that no accents were considered for the assessment.

The last capability, NPS network accessibility, is concerned with whether the web scraping tool is blocked by the NPS servers. If the tool was not blocked, it scored one point; otherwise, it scored zero. If the tool was not blocked, it received one point; otherwise, it received zero. This feature was crucial in determining the required resource for the thesis, whether a virtual machine or a personal laptop.

Table 5 summarizes the final scores and times for the 10 web scraping tools tested, while Appendix F contains detailed information about the implementation and assessment results for each web scraping tool.

Table 5. Web scraping tools: Final scores and times assessment.

No.	Tool	Mandatory features	Final score	Implementation time [min]	Scraping time [min]
1	Dexi.io	NO	10	454.73	22.15

### *g. Selection of web scraping tool*

After conducting the web scraping tool testing, certain limitations were identified. For commercial alternatives, a common limitation was the lack of an intuitive GUI, and in some cases, there was insufficient detailed tutorials and documentation to achieve successful web scraping results, especially when dealing with the ARC news website where customized commands were needed to address the page iteration problem at the second scraping level. Another minor limitation worth mentioning was the occurrence of semantic issues during the extraction process, particularly for the Spanish language.

On the other hand, for open-source web scraping tools, the primary limitation was the complexity in the implementation process, as it required certain knowledge in Java or Python programming languages to accomplish effective scraping of the websites.

In conclusion, among the ten web scraping tools tested, only three commercial tools (Octoparse, Parsehub, and Scrape Storm) fulfilled the mandatory criteria and were deemed suitable for use in this research. These three tools achieved final scores of 14, 13, and 11 points, respectively. Scrape Storm had the highest implementation time but the lowest scraping time on both websites, while Parsehub had the lowest implementation time but the highest scraping time. Octoparse appeared to be the most balanced option. However, both Octoparse and Scrape Storm websites were blocked by the NPS firewall. Thus, Octoparse installed on a personal laptop was chosen as the web scraping tool to collect cocaine seizures data for this study.

### **3. Statistical Data Tools**

The last tools used in this study were the statistical data tools. Firstly, Microsoft Excel was used to parse, organize, and conduct preliminary statistic tests on datasets. Subsequently, JMP was employed for EDA. Wherein various polynomial regression techniques were applied to determine the final regression models.

## **D. DATA PROCESSING**

Figure 6 outlines seven data processing phases for this study. The process began with web searches, followed by web scraping using Octoparse. After ingestion of structured data into Hadoop, extract, transform, and load (ETL) processes were implemented to store a preliminary dataset for cocaine seizures in the Hive warehouse. This draft file and the homicides' dataset were combined and processed in Excel using formulas and filters to create synchronized datasets. JMP (JMP Statistical Discovery LLC, 2023c) was then used for EDA to derive final regression models.

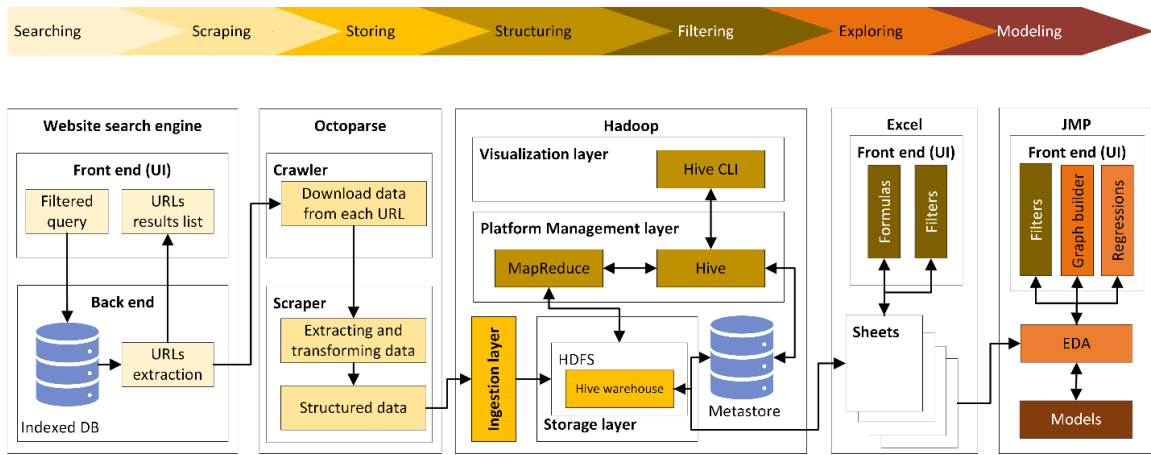

Figure 6. Data processing

Using the Microsoft Edge web browser, the searching phase started using the websites’ search engines to find related news articles, based on three specified search queries: (a) a search of the word *cocaína* in the ARC news portal (ARC, 2022); (b) a search of the word *cocaína* in the PONAL news portal (PONAL, 2023a); and (b) a search of the word *cocaine* in USCG (Bright Mountain Media, 2022). Each search query yielded a list of URLs containing relevant news articles with the respective keywords. At the same time, each list of URLs was linked to an exclusive URL for individual reference and access.

The exclusive URL served as a requirement to generate a task in Octoparse. Upon task creation, Octoparse semi-automatically recognized the website fields (clicking) in both the initial and subsequent scraping levels. To achieve this, a workflow was implemented to crawl each URL from the list, followed by an ETL process, which converted the data from HTML into a table format with customized fields. This resulting table was then exported to an Excel file. For comprehensive information about the exclusive URL, automatic field detection, and the Octoparse workflows for each news website, please refer to Appendix G.

Once the structured data was ready, the next step involved ingesting and storing it into the Hadoop Distributed File System (HDFS). HDFS is a fundamental component within the Hadoop ecosystem, known for handling Big Data. This filesystem can store

files in the order of Peta Bytes (PB), working under the concept of the write-once/read-many-times pattern. One of its advantages is its compatibility with commodity hardware, leading to cost-effective implementations and allowing for a greater number of nodes to enhance redundancy in the system (White, 2015, p. 43-54). The data extracted from each website using Octoparse is enclosed in an Excel file located in Appendix H.

After storing the data in the HDFS, Hive was utilized to conduct another ETL process to obtain the desired information regarding cocaine seizures. To do that, Hive allows users to perform queries through a Command-Line Interface (CLI), a web interface, or a server infrastructure using Structured Query Language (SQL) alike syntax. The commands go to the Hive's execution engine to submit mapping and reducing jobs for the batch query processor known as MapReduce. MapReduce executes the jobs using the data available in the HDFS and the metadata, organized in tables, in a metastore denominated Hive warehouse (White, 2015, p. 471–480). The three Hive scripts used for ETL of cocaine seizures information can be found in Appendix I, while the draft cocaine seizure datasets are included in Appendix J.

Once the draft cocaine seizures data was brought into Excel, several filters and operations were implemented. The resulting outcome, as illustrated in Figure 7, represents the step-by-step procedure carried out on each cocaine seizures dataset, ultimately culminating in the creation of the Pacific cocaine seizures dataset spanning from 2012 to 2022, with daily records.

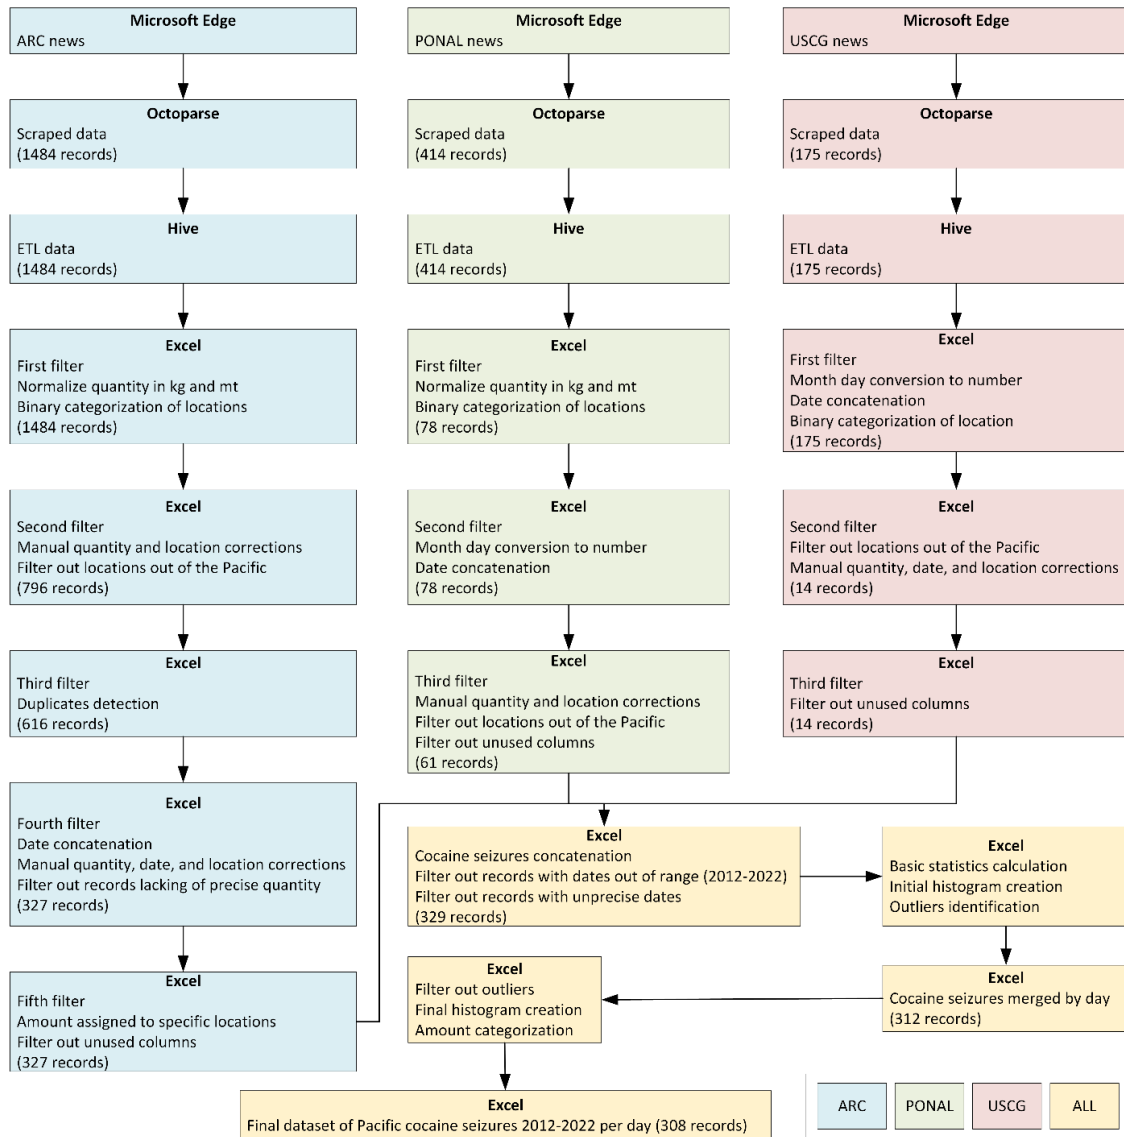

Figure 7. Filters and processing on the dataset for cocaine seizures in Excel

A detailed inspection of the day of the interdiction occurrence in the Pacific cocaine seizures dataset was of utmost importance, as it served as the starting point for assessing its influence on homicides in the Colombia Pacific region over the course of one to seven days following the event.

On the other hand, the dataset for homicides in Colombia underwent a more straightforward processing approach. Utilizing the Excel file provided by ODHDN (MDN-ODHDN, 2023), direct filtering and processing were carried out without the need

for employing big data tools. The resulting product, depicted in Figure 8, showcases the detailed sequence of operations performed on the dataset for homicides. This ultimately led to the development of the Colombian Pacific homicides’ dataset, from 2012 to 2022, with daily records. The respective Excel workbooks containing the various filters and processes applied to both the cocaine seizures and homicides datasets can be found in Appendix K.

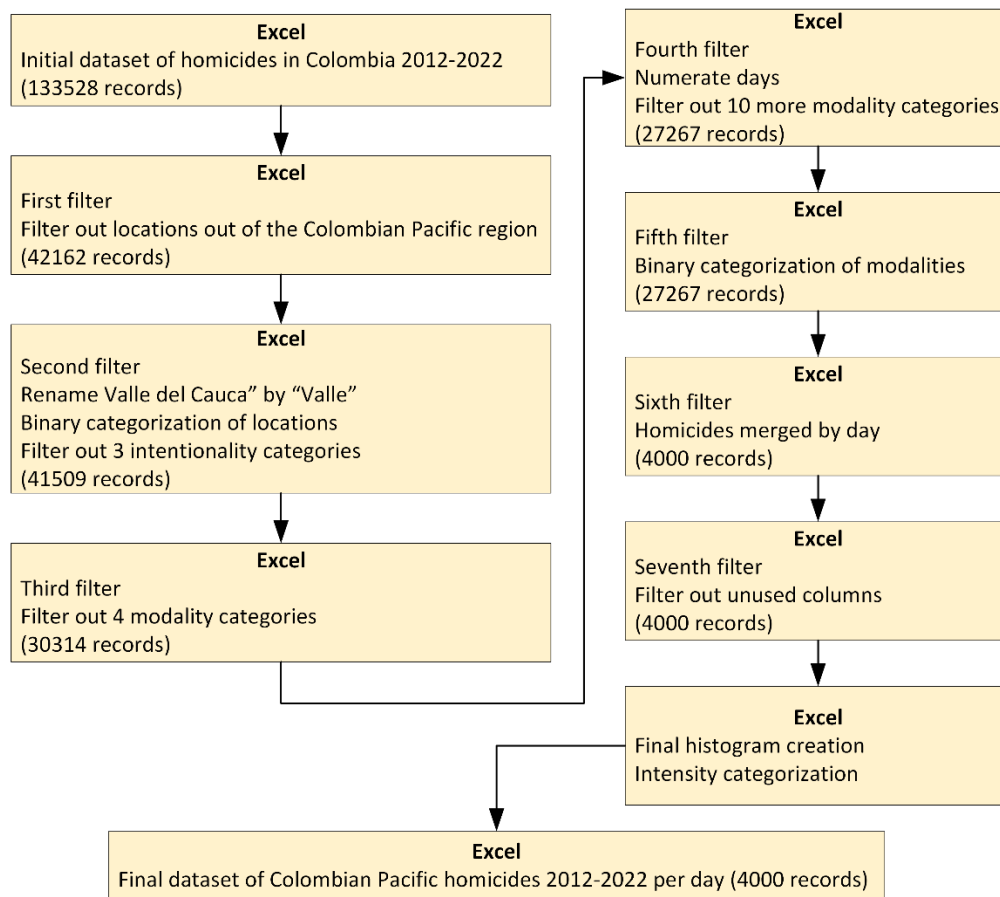

Figure 8. Filters and processing on the datasets for homicides in Excel

Although the initial number of records in the homicides’ dataset was 4000, the resulting sample size for the time series data turned out to be smaller. For the purpose of this study, only seven time series datasets could be created, each containing a sample size of 308 records. This constraint was a direct result of the sample size limitations imposed

by the final cocaine seizures dataset. On top of that, during the EDA performed in JMP, this sample size was drastically reduced to less than 100 records due to the application of additional filters.

The limited size of this sample may not be sufficient to confidently assert a correlation between cocaine seizures and homicides in the Colombian Pacific region. To establish a reliable correlation, a sample size of around 250 records would be required (Schönbrodt & Perugini, 2013). However, the study conducted by MacCallum, Widaman, Zhang, and Hong (1999) concluded that specific rules of thumb for sample size were not of great importance when it comes to factor analysis. Instead, they suggested that even with smaller sample sizes, exploratory studies, such as the one presented here, can still be sufficient and meaningful in providing valuable insights and initial findings.

Taking this into consideration, an EDA was conducted in JMP using the seven available time series datasets. A digital version of these datasets can be found in Appendix L. Furthermore, Chapter IV of the present study gives a comprehensive overview of both the preliminary and final results of the EDA. This chapter provides descriptions of the analysis process, offering constructive comprehensions and preliminary outcomes of the relationships between cocaine seizures and homicides in the Colombian Pacific region.

THIS PAGE INTENTIONALLY LEFT BLANK

## IV. RESULTS

### A. TIME-SERIES DATASETS

The data is contained in seven time-series sets, each containing 308 records with nine columns. The initial four columns pertain to cocaine seizure information, while the remaining five columns hold data on homicides. The variation across datasets lies in a single column, representing the day of homicides occurrence. In the first dataset, homicides are evaluated one day after the seizure; in the second dataset, two days after; and so on until the last dataset, which assesses homicides seven days after the seizure. The descriptions of datasets and columns can be found in Figure 9.

DATASET 1 (DSD+D+1)								
<b>COLUMN 1 (Day)</b> <small>The day the cocaine was seized by the authorities in the Pacific. Day 1 means 1/1/2012.</small>	<b>COLUMN 2 (Q_kg)</b> <small>The amount of cocaine seized in kg, the day indicated in column 1.</small>	<b>COLUMN 3 (Sea_Land)</b> <small>The location where the cocaine was seized. Sea means Pacific Ocean. Land means Colombian Pacific region.</small>	<b>COLUMN 4 (Size)</b> <small>The category of the cocaine seizure size. Small: less than 601.3kg. Average: 601.3 to 901.3kg. Large: more than 901.3kg.</small>	<b>COLUMN 5 (Day+1)</b> <small>The day after the cocaine seizure occurred in the Pacific. Day 2 means 1/2/2012.</small>	<b>COLUMN 6 (Homicides)</b> <small>The quantity of homicides reported on day +1 by the MDN-ODHDH in the Colombian Pacific region.</small>	<b>COLUMN 7 (H_Location)</b> <small>The departments of the Colombian Pacific region where the homicides were reported.</small>	<b>COLUMN 8 (Modality)</b> <small>The homicides modalities reported: a-b-s, coordination between organized crime, terrorism, organized crime, and terrorism.</small>	<b>COLUMN 9 (Intensity)</b> <small>The category of the homicides rate intensity. Low: less than 5. Medium: 5 to 9. High: more than 9.</small>
DATASET 2 (DSD+D+2)								
<b>COLUMN 1 (Day)</b>	<b>COLUMN 2 (Q_kg)</b>	<b>COLUMN 3 (Sea_Land)</b>	<b>COLUMN 4 (Size)</b>	<b>COLUMN 5 (Day+2)</b>	<b>COLUMN 6 (Homicides)</b>	<b>COLUMN 7 (H_Location)</b>	<b>COLUMN 8 (Modality)</b>	<b>COLUMN 9 (Intensity)</b>
• • •								
DATASET 7 (DSD+D+7)								
<b>COLUMN 1 (Day)</b>	<b>COLUMN 2 (Q_kg)</b>	<b>COLUMN 3 (Sea_Land)</b>	<b>COLUMN 4 (Size)</b>	<b>COLUMN 5 (Day+7)</b>	<b>COLUMN 6 (Homicides)</b>	<b>COLUMN 7 (H_Location)</b>	<b>COLUMN 8 (Modality)</b>	<b>COLUMN 9 (Intensity)</b>

Figure 9. Time-series datasets description

The time and quantity of cocaine seizures are the crucial pieces of information found in the first two columns of the dataset. The first column of the dataset represents the date when authorities conducted operations that resulted in cocaine seizures in the Pacific. In this column, a value of “1” corresponds to 1st January 2012, and subsequent numbers represent consecutive dates following that day. The second column reflects the total quantity of cocaine seized in kilograms on each respective day mentioned in the first column.

The following two columns contain nominal data for location and the size of cocaine seized. The third column specifies the category for seizure location, using “Sea” to represent the Pacific Ocean and “Land” for any department in the Colombian Pacific

region. Column four embodies the seizures intervals; there are three intervals that represents the size of the cocaine seizures: “Small” represents any seizures that involves less than 601.3kg of cocaine, “Average” represents the interval for the seizures between 601.3kg and 901.3kg of cocaine, and “Large” for seizure quantities exceeding 901.3kg of cocaine. This categorization is shown in Figure 10 from the histogram related in Appendix K.

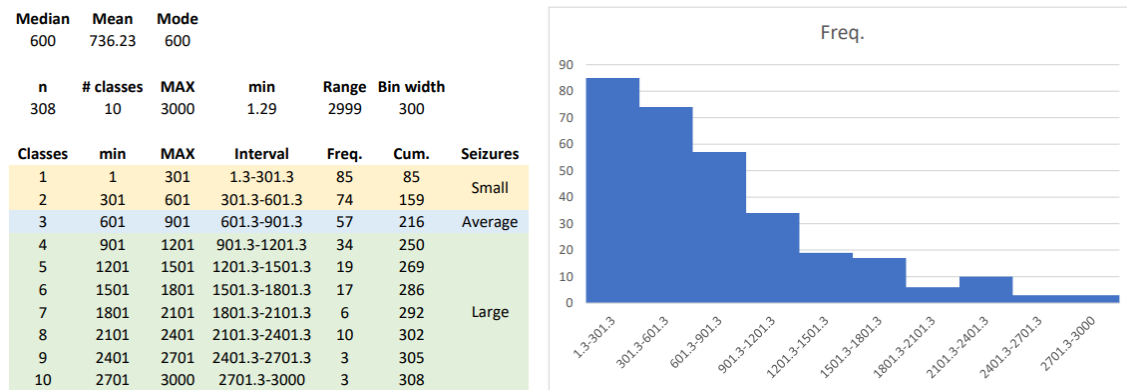

Figure 10. Cocaine seizures in the Pacific 2012–2022 histogram

The information related to homicides begins from column five, which is particularly crucial since it has a daily variation from one to seven days across all datasets. For example, in the first dataset, this column represents the day immediately following the cocaine seizure in the Pacific, while in the seventh dataset, it represents seven days after the seizure. In the first case, the primary objective is to assess the impact of cocaine seizures on the homicides rate in the Colombian Pacific region on the day right after the seizure. In the second scenario, the focus changes to evaluating this impact after a seven-day period following the seizure. For the intervening cases, the evaluation similarly shifts to corresponding days after the occurrence of the cocaine seizure.

Column six pertains to the rate of homicides, whereas column seven is related to the location of these incidents. The sixth column shows the overall count of homicides documented in the Colombian Pacific region for the specified date indicated in column five. Conversely, the seventh column specifies the departments where these homicides

were recorded. It is essential to note that the sixth column offers quantitative data for analysis, while column seven furnishes nominal data regarding the location.

Figure 11 shows column eight, which contains information about the homicide modalities. From the original dataset, seven modalities were recognized as closely associated with homicides resulting from illegal cocaine businesses in Colombia. The most prevalent modality on the list is the “hit man” with 26,471 instances, followed by organized crime-related homicides with 662 occurrences, organized crime confrontations with 210 cases, and terrorism with 109 incidents. The three remaining modalities of beheading, dismemberment, and strangulation (B+D+S), were merged into a single category, resulting in a total of 253 cases.

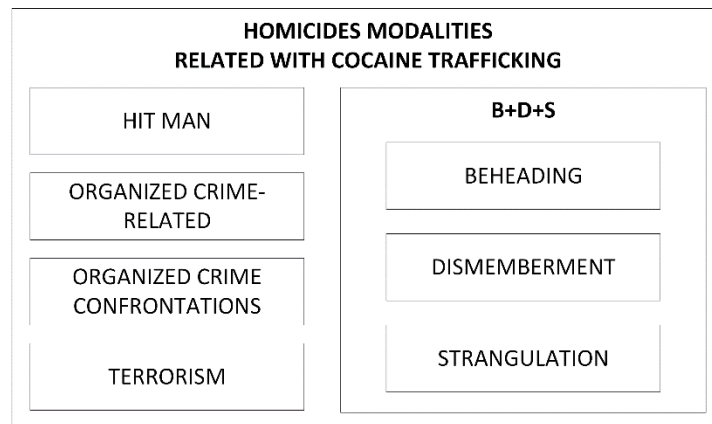

Figure 11. Homicides modalities

The “hit man” modality has been related to cocaine trafficking activities in Colombia. Originally, it was associated with cocaine business during the war declared by the drug traffickers against the Colombian government in the 1980s, where they offered a reward of \$2,000 for each police officer killed (Pardo, 2000). Later, during the 1990s, paramilitary groups adopted the same modality to target anyone connected to Pablo Escobar (Polit Dueñas, 2013, p. 90). As indicated by the numbers, the “hit man” modality stands out as the most prevalent method of homicide in the Colombian Pacific region. Moreover, drug cartels in Mexico have also adopted and continued to utilize this modality (Durán-Martínez, 2015; Wainwright, 2016, p. 106, 109).

Organized crime-related homicides in Colombia mainly originate from drug trafficking. According to Mejía and Restrepo (2008), guerrillas and paramilitary groups became drug producers and traffickers, resulting in a significant increase in their financial resources, which, in turn, escalated the internal conflict in Colombia (Cotte Poveda, 2012). González Peña and Dorussen (2021) provided additional support to this observation by finding that the homicide rate did not increase in the municipalities where FARC ex-combatants demobilized. This implies that the funding for illegal armed groups comes from the drug trade, and when they exit this business, the propensity for homicide decreases in their influential areas.

Confrontations between organized crime refer to homicides that occur when two illegal groups engage in combat with each other. For example, during the COVID-19 pandemic, there were reports of clashes between the *Clan del Golfo* and the *Ejército de Liberación Nacional* (ELN) guerrillas as they struggled for control of territories to carry out illicit activities in *Chocó*, which were left open after the demobilization of the FARC (Gillies & Hume, 2022).

Regarding terrorism, this refers to the homicides caused by terrorist groups. Gonzalez, Sierra, and Fajardo (2019) affirmed that terrorism in Colombia has both political and narcotraffic objectives. For instance, this narcoterrorism included methods as bombings (Zapata, 2003) and selective assassinations of government officials advocating stringent anti-drug policies in Colombia, with the aim of instilling fear and terror among the population (Tarapues, 2012).

The merged category B+D+S includes the homicides due to beheading, dismemberment, and strangulation. Phillips (2015) supported the recognition of dismemberment as a brutal practice connected to the armed conflict in Colombia. Also, Fajardo Cely (2014) compiled documented cases where evidence indicated the utilization of diverse violent methods to torture and kill individuals during the Colombian armed conflict, such as beheading, dismemberment, decapitation, evisceration, incineration, castration, impaling, and the use of acid (p. 55). As mentioned earlier, the Colombian armed conflict is closely interlinked with the problem of drug trafficking.

Finally, in column nine, the severity of the homicide rate is sorted into three groups: “Low” for rates less than five, “Medium” for rates ranging between five and nine, and “High” for rates greater than nine. This classification was derived from the histogram detailed in Appendix K and it is shown in Figure 12.

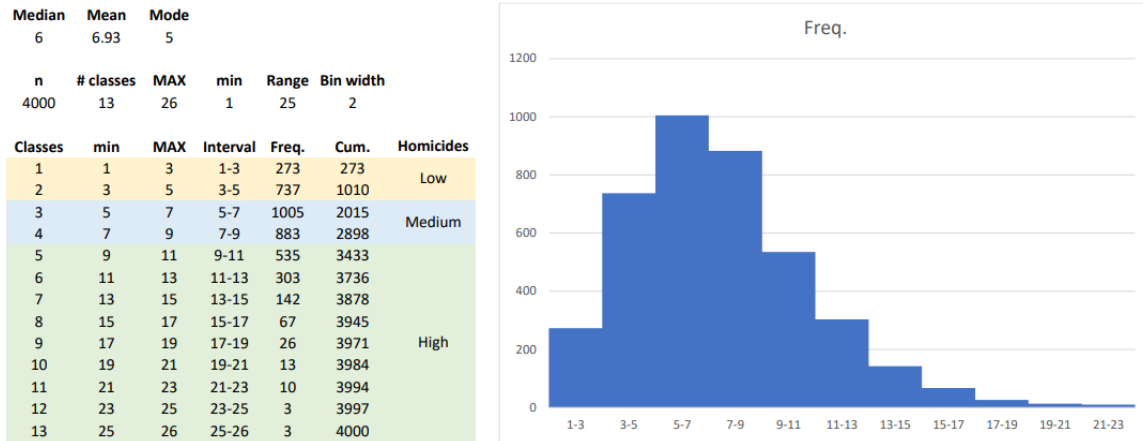

Figure 12. Homicides rate in the Colombian Pacific region 2012–2022 histogram

All the information regarding homicides was recorded based on data gathered by the MDN-ODHDN (2023). Table 6 summarizes the level of measurement corresponding to each variable.

Table 6. Level of measurement for time-series datasets variables

Column	Group	Classification	Variable	Level of measurement	Reference unit/category
1	Cocaine Seizures	Independent	Day	Interval	#
2			Q_kg	Ratio	kg
3			Sea_Land	Nominal	Sea or Land
4			Size	Ordinal	Small, Average, or Large
5	Homicides	Dependent	Day + n (n ∈ [1,7])	Interval	#
6			Homicides	Ratio	#
7			H_Location	Nominal	Cauca, Choco, Narino, or Valle
8			Modality	Nominal	Hit man, organized crime, organized crime confrontations, terrorism, or B+D+S
9			Intensity	Ordinal	Low, Medium, or High

## B. DATASETS TIME FRAMES

After filtering the data, each time-series dataset contains only 308 records. Although the datasets still conserve records between 2012 and 2022, the distribution of records across individual years is uneven. This might be a limitation to the study, as data might not capture the trends between cocaine seizures and homicides in the Colombian Pacific region for some years. The distribution of records per year for the datasets is presented in Table 7.

Table 7. Records per year for time-series datasets

Year	Number of records
2012	3
2013	22
2014	17
2015	50
2016	54
2017	60
2018	53
2019	13
2020	12
2021	17
2022	7

Additionally, Table 8 illustrates the time spans covered by the datasets, showcasing the starting and concluding dates for each one. This delineation of initial and final dates, coupled with the record distribution showcased in Table 7, shows the consistency of the time intervals covered by the gathered and filtered data. Again, the scope of this study is constrained to the period between 2012 and 2022 as a result of the data obtained through web scraping from the ARC news website. The ARC website started the publication of seizure-related news in 2012, and any records preceding this timeframe are not accessible at its online platform.

Table 8. Datasets time frames

Reference	Day	Day+1	Day+2	Day+3	Day+4	Day+5	Day+6	Day+7
Initial day	264	265	266	267	268	269	270	271
Initial date (MM/DD/YY)	9/20/12	9/21/12	9/22/12	9/23/12	9/24/12	9/25/12	9/26/12	9/27/12
Final day	4000	4001	4002	4003	4004	4005	4006	4007
Final date (MM/DD/YY)	12/13/22	12/14/22	12/15/22	12/16/22	12/17/22	12/18/22	12/19/22	12/20/22

### C. EXPLORATORY DATA ANALYSIS

Following with the process, these seven comprehensive datasets were imported into JMP to proceed with the analysis of correlations and trends between cocaine seizures and homicides in the Colombian Pacific region. By using graph builder functionality was used to compare all the independent and dependent variables (JMP Statistical Discovery LLC [JMP], 2023), identified in Table 6.

The resulting scatter graphs offer the option to select various types of elements (JMP Statistical Discovery LLC, 2023b). For exploration purposes, points and line of fit options were chosen. The chosen fitting approach was polynomial, encompassing linear, quadratic, or cubic degree regressions. Given the variables combinations and the polynomial degree options, a comprehensive exploration of regression models were tested for the best fit.

The metrics that were used to study statistical significance of the regression models are as follows. A 95% confidence interval was applied. The Root Mean Square Error (RMSE), R-square value ( $R^2$ ), F test value, and probability value [p-value] for each of the regressors was extensively studied. Among these metrics, only the p-value and  $R^2$  were considered for the initial phase of the exploration.

Prior to assessing each regression, a null and an alternate hypotheses were identified. In this investigation, the null hypothesis ( $H_0$ ) is that the occurrences of cocaine seizures in the Pacific area do not have an impact on the homicide rate in the Colombian Pacific region; the alternative hypothesis ( $H_1$ ) is that the cocaine seizures in

the Pacific region do have an impact on the homicide rate in the Colombian Pacific region.

In this context, the p-value test indicates the degree of statistical significance of the regressors (independent variables). As a result, a significant p-value means to accept H1 and reject the null (Keller, 2012, p. 369). The p-value that is less than 0.01 indicates high significance, between 0.01 and 0.05 is significant, whereas other values indicate there is not significant relation between the independent and dependent variables, hence H1 is rejected (Keller, 2012, p. 371).  $R^2$  represents the proportion of variability in the dependent variable that can be explained by changing the independent variable, with an interpretation of 1 denoting an absolute 100% correlation between the two variables (Keller, 2012, p. 139).

Following the application of the designated fitting parameters, information conforming to the chosen variable categories is extracted, creating new sub-datasets. Subsequently, JMP uses machine learning techniques to learn from the available data by recognizing patterns for each regression alternative. Upon executing all potential regressions, seven models with significant statistical evidence for H1 have been discerned. Table 9 provides an overview of these results, outlining the polynomial regression level, sample size, p-value, and  $R^2$ . Detailed information regarding these seven findings can be found in Appendix M.

Table 9. Findings on polynomial regressions

#	Finding	Degree	Sample size	p-value	R <sup>2</sup>
1	Cocaine seizures on the Colombian Pacific Sea correlates with low-intensity rate of homicides in the Colombian Pacific Region a day after.	Linear	47/308	0.0277	0.103
2	Large cocaine seizures in the Colombian Pacific Region correlates and might be associated to the rate of homicides in the Colombian Pacific Region two days after.	Cubic	92/308	Low 0.0398 Med 0.0144 High <0.001	Low 0.279 Med 0.196 High 0.958
	Cocaine seizures in the Colombian Pacific Land correlates with high-intensity rate of homicides in the Colombian Pacific Region two days after.	Linear	25/308	0.0421	0.168
4	Large and average cocaine seizures in the Colombian Pacific Region correlates and might be associated to the high-intensity rate of homicides in the Colombian Pacific Region six days after.	Cubic	26/308	Avg 0.0491 Large 0.0099	Avg 0.606 Large 0.664
5	Large cocaine seizures in the Colombian Pacific Region correlates with the hit man homicides modality in the Colombian Pacific Region seven days after.	Cubic	82/308	0.0109	0.133
6	Cocaine seizures on the Colombian Pacific Sea correlates with high-intensity rate of homicides in the Colombian Pacific Region seven days after.	Cubic	18/308	0.0221	0.486
7	Large cocaine seizures in the Colombian Pacific Region correlates with low and high-intensity rate of homicides in the Colombian Pacific Region seven days after.	Quadratic	25/308	Low 0.0491 High 0.0099	Low 0.212 High 0.930

Figure 13 provides a preliminary overview of the alternative hypotheses derived from regression analysis. This analysis considered the correlation of the data across various categories of cocaine seizure sizes in the Pacific and their impact on the homicide intensity in the Colombian Pacific region. The bold arrows indicate a robust correlation, backed by high significance with p-values below 0.01. Meanwhile, the thin arrows represent significant correlations supported by p-values under 0.05. Notably, findings 2 and 4 suggest that significant large cocaine seizures in the Pacific have an influence on the emergence of a high-intensity homicide rate in the Colombian Pacific region, manifesting two and six days after the seizures.

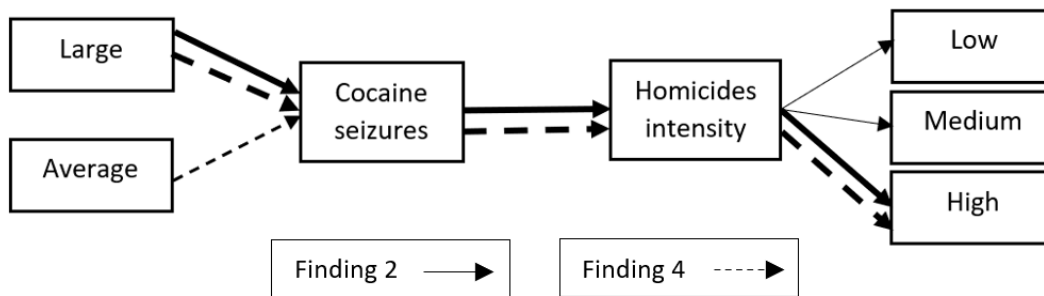

Figure 13. Alternative hypothesis from findings 2 and 4

#### D. FURTHER ANALYSIS

To further explain the relation between the independent and dependent variables, an improved approach was followed. The first step involves a fitting through the JMP graph builder fitting tools. This step allows to filter data and capture different behaviors that vary in different time intervals. The second step is to conduct a least-squares regression analysis to examine, identify, and exclude (if necessary) data points with high impact on the model fit. The third step aimed at identifying the most suitable continuous distribution for the values of the independent variable, enabling the determination of distribution parameters. Lastly, a profiler is suggested for each model to simulate, predict, and visually illustrate how changes in the range of cocaine seizures and the classification of sea/land areas influence the homicide rate in the Colombian Pacific region. This procedure is shown in Figure 14.

Figure 14. Filtering, exploring, and modeling procedure in JMP

Based on the outcomes derived from the *DSD+D+2.Large-Intensity* and the *DSD+D+6.Size-Intensity* datasets, which are contained in Appendix M, a graph builder

fitting technique was applied to create new datasets denominated *DSD+D+2-subset* and *DSD+D+6-subset*, respectively. This filtering procedure involved the elimination of categories and a hands-on exploration of data point boundaries to achieve a better p-value and  $R^2$  value. These new datasets are provided in Appendix N.

To improve the accuracy of these two models, a least squares analysis was used to reduce discrepancies and discover the best match between the independent variable (cocaine seizures) and the dependent variable (homicides). Additionally, this method, along with an emphasis on the leverage effect, aids in examining influential datapoints and identifying instances of extreme values within the independent variable that could potentially impact the model's fit. After excluding the outliers, another least squares analysis was conducted, resulting in an improved model. Figure 15 shows the parameters specified to fit the model.

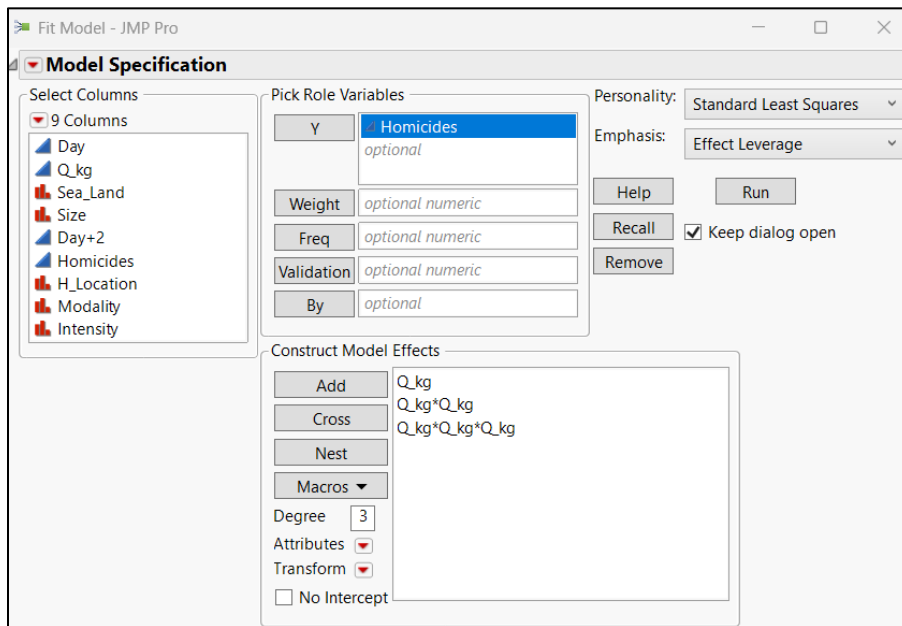

Figure 15. Standard least squares parameters

Although the least squares process employs identical parameters for both sub-sets of data, the outcomes diverge. For the continuous distribution comparison and the profiling processes, the parameters and corresponding results are different for each case.

## E. DSD+D+2-SUBSET

### 1. Graph Builder Fitting and Least Squares Analysis

The filtering resulted in a subset, consisting of 23 data points out of the original 308 (approximately 7.46% of the total), reveals a correlation between cocaine seizures and the incidence of homicides in the Colombian Pacific region. The regression analysis yields a significant p-value of 0.0285. Furthermore, the applied cubic model effectively accounts for 37.2% of the variance in the homicide rates above eight within the Colombian Pacific region, attributed to cocaine seizures exceeding 750 kg occurring in the Pacific two days before. Also, the RMSE of the model suggests an average prediction deviation of around 2.81 homicides per day. Notably, all instances correspond to the “hit man” modality, while two align with the B+D+S modality, and one relates to confrontations between organized crime. On the other hand, at least 16 instances of cocaine seizures took place at sea. Figure 16 shows the *DSD+D+2-subset* polynomial regression result.

Figure 16. DSD+D+2-subset polynomial regression result

The actual by predicted plot, shown in Figure 16, indicates that majority of the data points are within the confidence interval. However, there are some outliers in the sample. To further analyze the outliers in the model, a row diagnosis of the studentized residuals was conducted. Figure 17 illustrates that 21 out of the 23 data points fall within the 95% confidence level’s concurrent boundaries (red lines) and the individual limits

(green lines). The remaining two data points (specifically, rows 10 and 23 of the subset) lie beyond these boundaries.

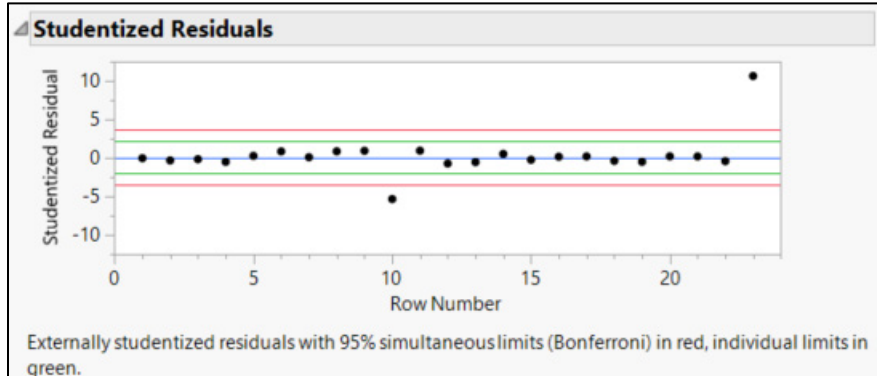

Figure 17. Studentized residuals plot for DSD+D+2-subset

After removing the outliers, another least squares model was conducted. The result of the polynomial regression is shown in Figure 18. In this scenario, the exclusion of outliers has a negative effect on the model's significance. Although the studentized residuals plot exhibits no data points exceeding the 95% confidence level, the actual by predicted plot suggests a lack of statistical significance, with a p-value surpassing 0.05 and lowered the  $R^2$  below 0.3.

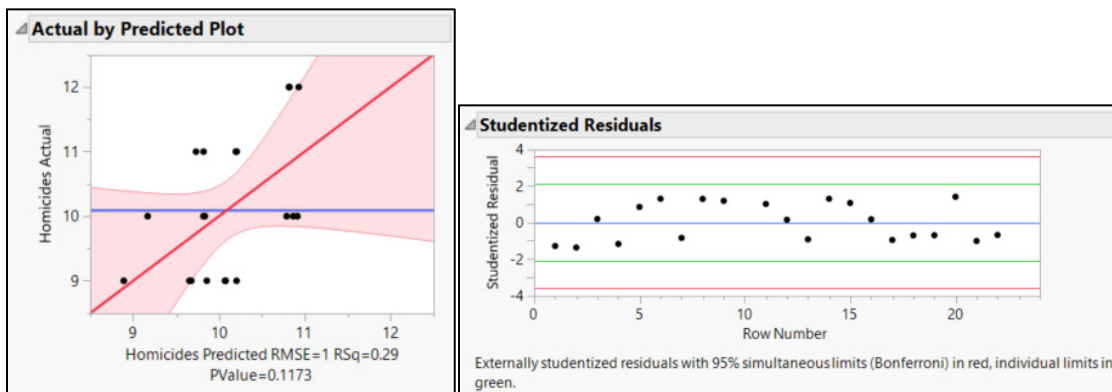

Figure 18. DSD+D+2-subset without outliers' regression result and studentized residuals

Through an iterative exploration, it was found that the model experiences significant improvement by excluding the outlier associated with row 10 and including the nominal variable Sea\_Land. The statistical examination results in a high significant p-value  $<0.0001$ . Furthermore, the cubic fit model results demonstrate its effectiveness by accounting for 80% of the variability in homicide rates exceeding eight within the Colombian Pacific region. This variability is attributed to instances of cocaine seizures surpassing 750 kg, which occur in the Pacific two days prior. Also, the RMSE of the model suggests an average prediction deviation of around 1.78 homicides per day. The results of the polynomial regression are shown in Figure 19.

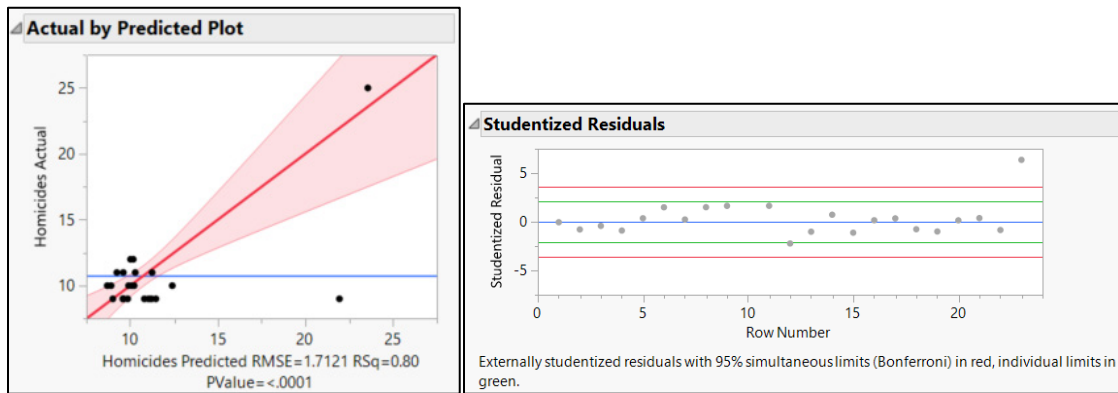

Figure 19. DSD+D+2-subset without outlier (row 10) regression result and studentized residuals

In this analysis, retaining the outlier associated with row 23, improves the model’s significance. Consequently, the model shown in Figure 19 was chosen as “Subset 1” for the purposes of continuous distribution comparison.

## 2. Continuous Distribution Comparison

Considering the independent variable values of the Subset 1, corresponding to cocaine seizures, a new EDA took place. An exploration of possible distribution that can capture the cocaine seizures data was based on two criteria, which are the Akaike Information Criterion applicable to small samples (AICc) (Sugiura, 1978) and the Bayesian Information Criterion (BIC) (Schwarz, 1978) was conducted. Figure 20

illustrates the best fit with the lowest AICc and BIC values. For this case, the best continuous distribution was the lognormal.

Figure 20. DSD+D+2-subset without outlier (row 10) lognormal distribution

The lognormal distribution is often used to model data exhibiting a positively skewed pattern, where the majority of values are concentrated on the lower end of the distribution (Crow & Shimizu, 1987). The parameters used to describe the fitted lognormal distribution were the location ( $\mu=7.126$ ) and scale ( $\sigma=0.316$ ). Finding the best distribution was critical to identify the parameters for profiling, simulating, and prediction analysis.

### 3. Profiling, Simulating, and Prediction Analysis

JMP prediction profiler enables simulation and the visualization of interaction among the independent and dependent variables (homicides) in the Colombian Pacific region. This analysis was conducted by adjusting two variables: the quantity of seized cocaine (Q\_kg) and the Sea\_Land category. The lognormal distribution parameters for the former should remain consistent to accurately reflect the data in “Subset 1.” Similarly, the occurrence probability derived from the information in “Subset 1” should be maintained for the latter. In addition, using the simulation tool allows the reproduction of diverse scenarios and prediction of varying outcomes. Figure 21 shows the prediction profiler and simulator created using data from “Subset 1,” identified as “Model 1.” As can be seen in the lower left quadrant in Figure 21, for larger seizures, Q\_kg and Sea\_Land variables interact.

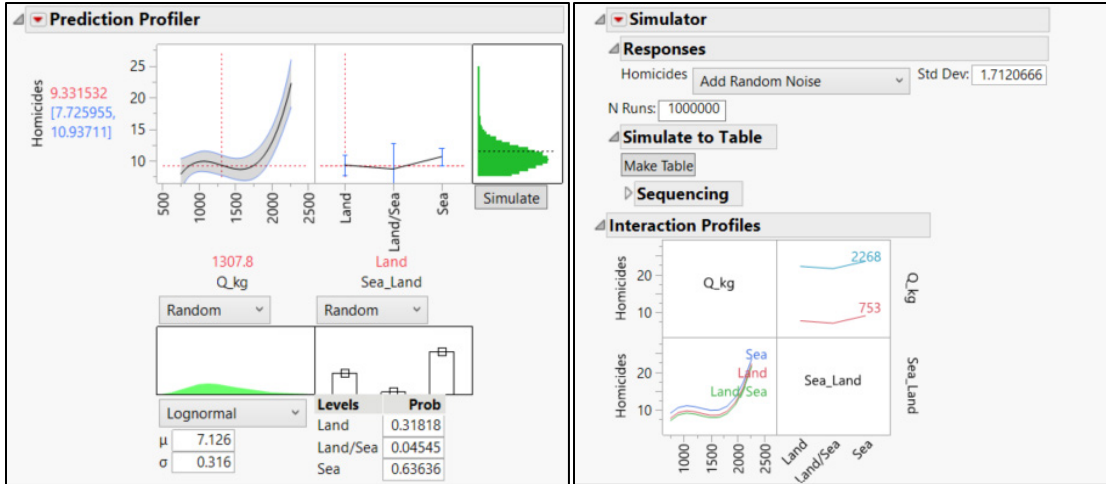

Figure 21. Model 1: Prediction profiler and simulator for Subset 1

In the simulator, a random noise can be configured and smeared to the simulation. Again, this standard deviation value matches with the RSME showcased in Figure 19. The number of runs correspond to additional parameters to perform a Monte Carlo simulation. All the parameters in the prediction profiler and the simulator can change to estimate different outcomes. Additionally, as the input parameters vary, different outcomes can be saved in a new table to create an output collection corresponding to the simulation results of different scenarios. Figure 22 shows the interaction profiles obtained with the parameters specified in Figure 21.

Figure 22. Interaction profiles for Model 1

In Figure 22, quadrants A and B show the outcomes for Model 1. In quadrant A is possible to interact with the Sea\_Land categories within the specified range. For example, when Land category is selected at the lower limit (red line), it indicates that if 753 kg of cocaine were seized in Pacific land, there would be an estimated average of eight homicides in the Colombian Pacific region two days later. Following up with Land category until the upper limit (blue line) will depict the correlation between the cocaine seize in Pacific land and the homicides in the Colombian Pacific region two days later. This pattern is mirrored by the red curve shown in quadrant B of Figure 22. A similar scenario applies for Sea (blue curve) and Land/Sea (green curve) categories.

Regarding Model 1, the Sea category exerts a more significant influence on the rate of homicides. The graphical representation in quadrant B, indicated by the blue curve, shows an average of two more homicides than the red curve and three more homicides than the green curve. This suggests that when cocaine above 753 kg is seized in the Pacific sea, there would be an average of two additional homicides in the Colombian Pacific region two days later compared with the case of seizures in the Pacific land. All subsets and models discussed in this section are enclosed in Appendix O.

## F. DSD+D+6-SUBSET

### 1. Graph Builder Fitting and Least Squares Analysis

The DSD+D+6-subset, comprising 31 samples out of a total of 308 (representing 10.06%), shows a significant correlation between cocaine seizures and homicides. This is a statistically significant result with a p-value of 0.011. This cubic fit model explains 33% of the variation in the rate of homicides above nine in the Colombian Pacific region due to cocaine seizures above 545 kg occurred in the Pacific six days before. The RMSE of the model suggests, on average, that the predictions are off by approximately 1.61 homicides per day. In this analysis, all instances correspond to the “hit man” modality, with four associated with B+D+S, two linked to organized crime confrontations, another two tied to organized crime, and two more connected to the terrorism modality. Conversely, 13 instances of cocaine seizures took place at sea, while the others occurred on land. Figure 23 shows the DSD+D+6-subset polynomial regression result.

Figure 23. DSD+D+6-subset polynomial regression result

The actual by predicted plot shows the significance of the analysis as the confidence curve crosses the horizontal line. However, there are some outliers in the sample. To highlight the outliers in the model, a row diagnosis of the studentized residuals was applied. Figure 24 illustrates the fact that 29 out of the 31 data points fall within the 95% confidence level’s concurrent boundaries (red lines) and the individual

limits (green lines). The remaining two data points (specifically, rows 13 and 17 of the subset) lie beyond these boundaries.

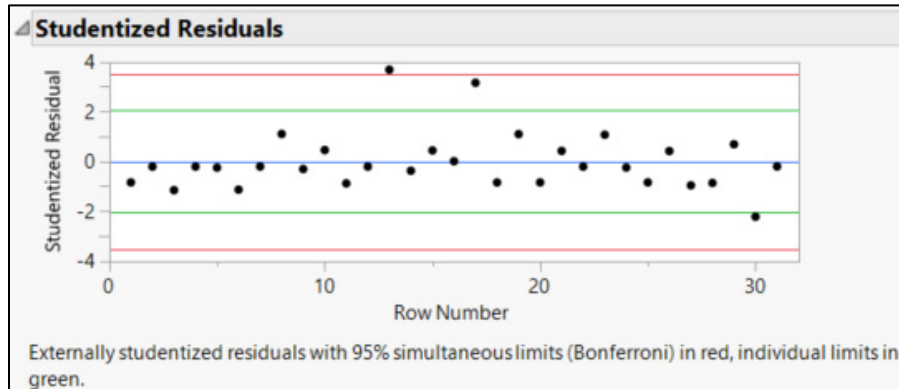

Figure 24. Studentized residuals plot for DSD+D+6-subset

Through an exploration analysis, it was found that the model improves significantly by excluding the outliers associated with rows 13 and 17, also including the nominal variable *Sea\_Land*. The statistical examination results in a high significant p-value of less than 0.0011. Furthermore, the cubic model applied demonstrates its effectiveness by accounting for 52% of the variability in homicide rates exceeding nine within the Colombian Pacific region. This variability is attributed to instances of cocaine seizures surpassing 545 kg, which occur in the Pacific six days before. Also, the RMSE of the model suggests an average prediction deviation of around 1.06 homicides per day. The findings of the polynomial regression analysis are shown in Figure 25. This model was chosen as “Subset 2” for the purposes of continuous distribution comparison.

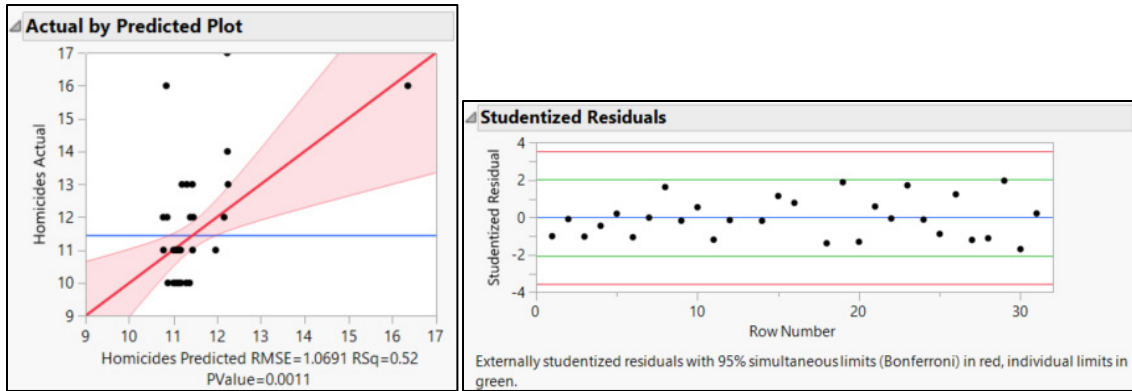

Figure 25. DSD+D+6-subset without outliers' regression result and studentized residuals

## 2. Continuous Distribution Comparison

Considering the independent variable values of the Subset 2, corresponding to cocaine seizures, another EDA was conducted. An exploration of possible distribution that can capture the cocaine seizures data was based on two criteria, which are the Akaike Information Criterion applicable to small samples [AICc] (Sugiura, 1978) and the Bayesian Information Criterion [BIC] (Schwarz, 1978) was conducted. Figure 26 illustrates the best fit distribution with the lowest AICc and BIC values. For this case, the best continuous distribution was the Johnson Sb (Slifker & Shapiro, 1980).

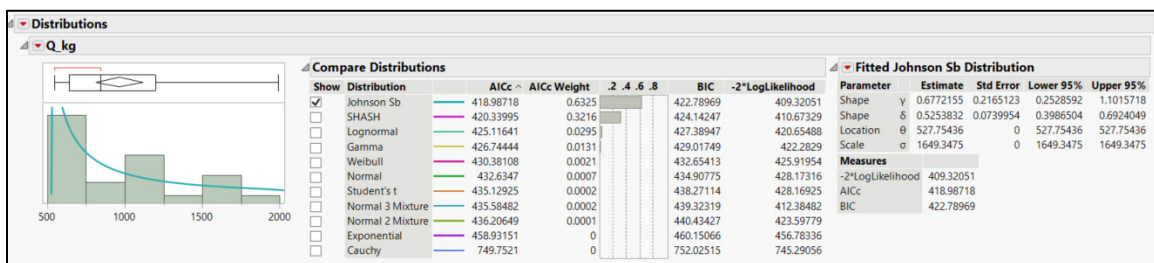

Figure 26. DSD+D+6-subset without outliers Johnson Sb distribution

The Johnson Sb distribution is useful when working with data that exhibit skewness and kurtosis (Jones, 2004). The parameters of the fit that are used to describe the fitted Johnson Sb distribution were the kurtois shape ( $\gamma=0.677$ ), skewness shape

( $\delta=0.525$ ), lower bound location ( $\theta=527.75$ ) and scale ( $\sigma=1649.34$ ). Finding the best continuous distribution was necessary to identify the parameters for profiling, simulating, and predicting purposes.

### 3. Profiling, Simulating, and Prediction Analysis

JMP prediction profiler enables simulation and the visualization of interaction among the independent and dependent variables (homicides) in the Colombian Pacific region. This analysis was conducted by adjusting two variables: the quantity of seized cocaine (Q\_kg) and the Sea\_Land category. The Johnson Sb distribution parameters for the former should remain consistent to accurately reflect the data in “Subset 2.” Similarly, the occurrence probability derived from the information in “Subset 2” should be maintained for the latter. However, employing a simulator allows the reproduction of diverse scenarios and prediction of varying outcomes. Figure 27 shows the prediction profiler and simulator created using data from “Subset 2,” identified as “Model 2.” As can be seen in the lower left quadrant in Figure 27, for larger seizures, Q\_kg and Sea\_Land variables interact.

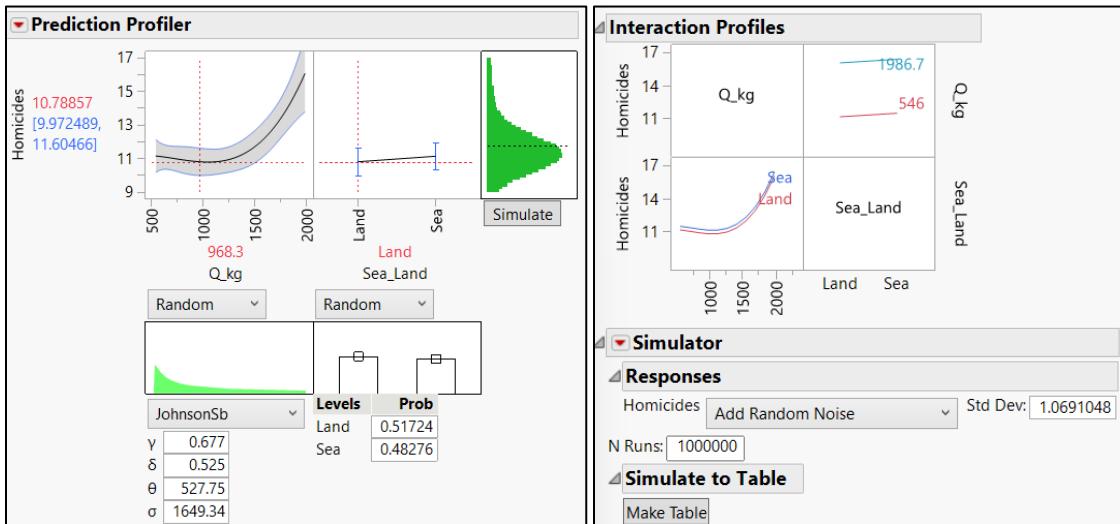

Figure 27. Model 2: Prediction profiler and simulator for Subset 2

Note also, that in the simulator responses' options, a random noise can be configured. Again, this standard deviation value matches with the RSME showcased in Figure 25. The number of runs correspond to additional parameters to perform a Monte Carlo simulation. All the parameters in the prediction profiler and the simulator can change to estimate different outcomes. Additionally, as the input parameters vary, different outcomes can be saved in a new table to create an output collection corresponding to the simulation results of different scenarios. Figure 28 shows the interaction profiles obtained with the parameters specified in Figure 27.

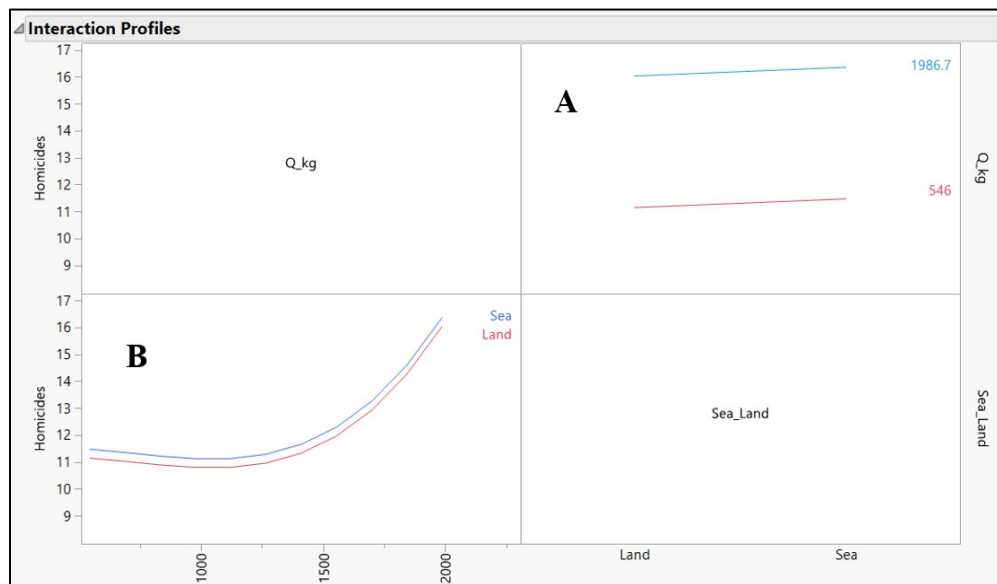

Figure 28. Interaction profiles for Model 2

In Figure 28, quadrants A and B show the outcomes for Model 2. In quadrant A is possible to interact with the Sea\_Land categories within the specified range. Similarly, when Land category is selected at the lower limit (red line), it indicates that if 546 kg of cocaine were seized in Pacific land, there would be an estimated average of eleven homicides in the Colombian Pacific region six days later. Following up with Land category until the upper limit (blue line) will depict the correlation between the cocaine seize in Pacific land and the homicides in the Colombian Pacific region six days later.

This pattern is mirrored by the red curve shown in quadrant B of Figure 22. A similar scenario applies for Sea (blue curve) category.

Regarding Model 2, the Sea category exerts a more significant influence on the rate of homicides. The graphical representation in quadrant B, indicated by the blue curve, shows an average of one more homicide than the red curve. This suggests that when cocaine above 546 kg is seized in the Pacific sea, there would be an average of one additional homicides in the Colombian Pacific region six days later compared with the case of seizures in the Pacific land. All subsets and models discussed in this section are enclosed in Appendix P.

## V. DISCUSSION

Given the studies conducted by Miron (2001) and UNODC (2012), the collection and utilization of time series data led to results that were more closely aligned with Miron's findings. The findings of this study showed a connection between cocaine seizures and homicides. Model 1 captures the correlation between cocaine seizures exceeding 750 kg in the Pacific area (both sea and land) and the homicide rate (above eight) in the Colombian Pacific region with two days lag time. Similarly, Model 2 captures how cocaine seizures greater than 545 kg in the Pacific area impact the homicide rate (higher than nine) in the Colombian Pacific region six days later.

Although Model 1 might seem deceiving because it included an outlier data point to improve its significance, this situation improved in Model 2, as it provides more reliable outcomes concerning the relation among variables. The relation between the cubic fit models that underpin Model 2 more accurately captures the nature of the variables; this is primarily due to the presence of more data points. Also, Model 2 demonstrates a more logical progression of  $R^2$  values. The explanation for the variation in the homicides rate (higher than nine) in the Colombian Pacific region due to cocaine above 545 kg seized in the Pacific area, with six days lag time, exhibited a gradual rise from 33% to 52% after excluding outliers.

Nevertheless, a critical drawback applicable to both models pertains to the sample size. While the sample size may not provide definitive conclusions about the relationship between cocaine seizures and homicides in the Colombian Pacific region, the EDA conducted in this thesis enables the identification of mathematical models that align with the available data. Accordingly, even though a linear correlation between the variables is not significant, the seizures of cocaine hydrochloride through both maritime and terrestrial means in the Pacific area appears to be a factor that influenced homicide rates in the Colombian Pacific region from 2013 to 2021 for Model 1, and from 2012 to 2022 for Model 2.

For this reason, it is crucial to strike a balance in implementing diverse strategies against drug trafficking to achieve short-term results while ensuring they do not foster violence within Colombian territory. To achieve this goal, it will be crucial to maintain continuous monitoring of the factors inherent in each strategy and to closely observe the homicide rate in the areas where these strategies are implemented. The positive outcomes yielded by law enforcement efforts in the short term should encourage coca growers to willingly participate in government programs. To ensure tangible and enduring results in the medium and long term, there must be an unwavering commitment to these programs, regardless of the government in power.

Another inherent constraint of the models relates to the data collection process. Taking into account the technical, legal, and ethical restrictions associated with this endeavor, gaining access to information regarding cocaine seizures from the relevant authorities of countries within the Pacific region, actively engaged in combating drug trafficking, has proven unattainable. In the absence of this broader international viewpoint, the analysis can only address the correlation between these variables within the confines of the Colombian context. Timely data collection efforts can resolve the lag time problem in the data and hence ameliorate both the time series analysis and regression analysis.

Although the Colombian government's efforts in combating drugs play a crucial role in addressing this issue, it is vital to maintain consistent support from the international community. Collaborative strategies involving numerous nations and institutions, as seen in the Naval Campaigns Orion (Ortega, 2022), must persist, but with careful consideration to avoid situations such as the balloon effect (Dávalos & Morales, 2022), or provoking retaliatory actions and unintended harm in the territories impacted by the strategies (LSE IDEAS, 2014).

A recommendation for future research is that it would be beneficial to increase the sample size by accessing databases from the authorities of various nations that conduct maritime and land interdiction in the Pacific region. Additionally, it could investigate the impact of these interdiction efforts on the homicide rate in the territories that border the Pacific Ocean. Moreover, a research group with greater resources could consider

obtaining official information from state entities' websites using web scraping techniques, following all the necessary legal and ethical procedures for such data collection.

Another viable research alternative is to utilize the existing data in the models to design a qualitative study. This study should encompass the validation of all the data available in each model to confirm whether the narrative of each case aligns with the reality implicitly developed in the results presented here. By conducting a thorough qualitative analysis, researchers might gain deeper insights into the accuracy and coherence of the findings and their alignment with real-world situations in the Colombian Pacific region.

## APPENDIX A. ARC NEWS WEBSITE LEGAL CONSTRAINTS

The terms of use, copyright, privacy, and access policies are not explicitly indicated on this website as consulted on January 14, 2023. In turn, there were two guidelines regarding the information security policy (ARC, 2022a). As of this date, any of the guidelines indicated any restrictions on the usage of robots, spiders, scripts, or automated tools to extract or collect data from the content.

As per legal regulations (Congreso de la República de Colombia, 2014), the information present in the ARC news portal is classified as public information regarding copyrights. This classification is due to the absence of any indications that would categorize it as classified or reserved (ARC, 2022a).

Concerning privacy matters, the author of the thesis recognized and agreed to abide by the policies established in accordance with the Habeas Data law and the regulation of managing information contained in personal databases (Congreso de la República de Colombia, 2008), as well as the law for the protection of personal data (Congreso de la República de Colombia, 2012).

Finally, this thesis does not disclose any information beyond what is publicly available from the ARC. Moreover, the data extracted from the ARC news portal is solely intended for personal academic purposes and is not being used for any commercial endeavors.

THIS PAGE INTENTIONALLY LEFT BLANK

## **APPENDIX B. USCG NEWS WEBSITE LEGAL CONSTRAINTS**

The terms of use for this website were consulted by the thesis' author on January 14, 2023 (Bright Mountain Media, 2023b). As of this date, the website owner had not implemented any restrictions on the usage of robots, spiders, scripts, or automated tools to extract or collect data from the content. Furthermore, such restrictions were not among the 15 points outlined in their prohibited conduct guidelines.

Regarding copyrights, all the news that were gathered through scraping belonged to the USCG. Upon reviewing the privacy and security policy of the USCG news website, it stated that the information provided was intended as a public service (Department of Homeland Security [DSH], 2023).

With regards to privacy, the author of the thesis acknowledged and accepted the policies set forth by the website owner concerning the collection of PII, the use of cookies, and the storage of user information. Additionally, they acknowledged compliance with the California Consumer Privacy Act. (Bright Mountain Media, 2023a).

Ultimately, this thesis does not reveal any information beyond what is already provided by the USCG as a public service. Furthermore, the information extracted from the USCG is strictly intended for personal academic purposes and is not being utilized for any commercial use.

THIS PAGE INTENTIONALLY LEFT BLANK

## APPENDIX C. PONAL NEWS WEBSITE LEGAL CONSTRAINTS

As of January 20, 2023, the terms of use stated on this website, as provided by the PONAL (2023b), do not contain restrictions on the utilization of robots, spiders, scripts, or automated tools for the purpose of extracting or collecting data from the content.

In terms of copyrights, the institution adheres to the open data policy established by the Ministry of Technology and Information in Colombia (Ministerio de Tecnologías de la Información y las Comunicaciones [MINTIC], 2021). This policy defines open data as public information presented in formats that enable its use and reuse under an open license, without any legal restrictions on its utilization.

Regarding privacy concerns, the author of the thesis acknowledges and accepts the disclosure of individual information collected by the PONAL in compliance with its privacy policy when visiting its news website (PONAL, 2015).

Finally, this thesis does not disclose any information beyond what is publicly available from the PONAL. Moreover, the data extracted from the PONAL news portal is solely intended for personal academic purposes and is not being used for any commercial endeavors.

## Coast Guard offloads \$6.5 million in seized cocaine in San Juan

Oct 6th, 2022 · Comments Off

The crew of the Coast Guard Cutter Winslow Griesser and Caribbean Corridor Strike Force agents offloaded 721 pounds (327kgs) of cocaine Oct. 5, 2022 in San Juan, Puerto Rico, following the interdiction of a smuggling vessel in the Mona Passage Sept. 26, 2022. (U.S. Coast Guard photo by Ricardo Castrodad)

**SAN JUAN, Puerto Rico** — The crew of the Coast Guard Cutter Winslow Griesser and Caribbean Corridor Strike Force agents offloaded 721 pounds (327kgs) of cocaine Wednesday in San Juan, Puerto Rico, following the interdiction of a smuggling vessel in the Mona Passage.

The four men apprehended in this case claimed to be Dominican Republic nationals who are facing federal prosecution in Puerto Rico for Conspiracy to Possess with Intent to Distribute a Controlled Substance Aboard a Vessel Subject to the Jurisdiction of the United States. This charge carries a minimum sentence of 10 years imprisonment and a maximum sentence of imprisonment for life. An additional charge includes Assaulting Federal Officers with a Deadly Weapon, which carries a maximum sentence of 20 years imprisonment.

The Transnational Organized Crime Assistant U.S. Attorney Jorge Matos from the U.S. Attorney's Office for the District of Puerto Rico is leading the prosecution for this case, while Special Agents supporting the Caribbean Corridor Strike Force are leading the investigation.

During the late night hours of Sept. 26, 2022, the aircrew of a Customs and Border Protection Air and Marine multi-role enforcement aircraft detected a suspect go-fast vessel in waters northwest of Desecheo Island, Puerto Rico. With Coast Guard Cutter Winslow Griesser in pursuit, the smugglers jettisoned multiple bales of suspected contraband into the water. The Winslow Griesser crew stopped the suspect vessel, apprehended the four men and recovered 12 bales of the jettisoned contraband, which later tested positive for cocaine.

"I cannot be prouder of the Winslow Griesser crew, especially our small boat crew, whose skill and professionalism were instrumental in stopping this drug smuggling go-fast vessel," said Lt. Cmdr. Mark Tatara, cutter Winslow Griesser commanding officer. "We appreciate our Customs and Border Protection and our Coast Guard watchstanders who worked seamlessly to ensure a successful outcome in this case that helped keep these drugs from reaching the shores of Puerto Rico and bring those responsible to justice."

The interdiction is the result of multi-agency efforts involving the Organized Crime Drug Enforcement Task Force (OCDETF), the Caribbean Border Interagency Group and the Caribbean Corridor Strike Force. OCDETF identifies, disrupts, and dismantles the highest-level criminal organizations that threaten the United States using a prosecuter-led, intelligence-driven, multi-agency approach. Additional information about the OCDETF Program can be found at <https://www.justice.gov/OCDETF>.

Cutter Winslow Griesser is a 154-foot fast response cutter that is homeported in San Juan, Puerto Rico.

# Dexi.io -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
YES	NO	NO	High	157.73	300.00	7.43	14.72	NO	YES	1000	Medium	Medium	NO
	NO		1	454.73		22.15		0	3	1	2	2	1

## Remarks:

1. During the implementation it was not possible to solve the page iteration either the crawling inside the title link to gather the news content data.
2. The GUI was difficult to understand. The implementation of the robot's steps was not easy using blocks.
3. The documentation and the interface did not relate a function about the IP rotation function.
4. It is shown in the preliminary results that the language fidelity for Spanish and English was not good because some HTML coding traces remained in the date field after the extraction.
5. The trial version did not allow to export data to Excel.

# Helium Scraper -> ARC website

The image displays two screenshots of the Helium Scraper application interface. The top screenshot shows a data table with columns: id, title, uRL, intro, date, and author. The bottom screenshot shows a project explorer on the right side of the interface, listing various components like Data Flow, JSON Parsers, and Selectors. Blue circles with numbers 1 through 6 are overlaid on the screenshots to highlight specific features:

- 1**: Points to the 'Data Man' folder in the Project Explorer.
- 2**: Points to the 'Main' folder in the Project Explorer.
- 3**: Points to the 'Main' folder in the Project Explorer.
- 4**: Points to the 'MainChildren' folder in the Project Explorer.
- 5**: Points to the 'MainChildren' folder in the Project Explorer.
- 6**: Points to the 'MainChildren' folder in the Project Explorer.

The data table in the top screenshot contains the following rows (id, title, uRL, intro, date, author):

# Helium Scraper -> USCG website

The image displays two screenshots of the Helium Scraper application. The top screenshot shows the initial setup with a table of 100 rows and a project explorer. The bottom screenshot shows the scraper running and extracting data into a table.

**Top Screenshot:**

- 2:** The main configuration window on the left shows the scraper's logic, including a `Browser.Load` step with the URL `https://coastguardnews.com/?s=cocain` and a `Sequence.Take` step with a value of `12`.
- 3:** The Project Explorer on the right shows the data flow structure, including `Data Flow`, `Ajax`, `JSON Parsers`, `Queries`, `Text`, `Database`, `Data Man`, `Main`, `MainChildren`, `Globals`, and `Man`.
- 4:** The main configuration window on the left shows the `extract` step, which includes `title`, `url`, `date`, and `excerpt`.
- 5:** The table in the center shows the initial state with 100 rows, all of which are empty.

**Bottom Screenshot:**

- 6:** The table in the center shows the final state with 100 rows, all of which are populated with data extracted from the USCG website.
- 3:** The Project Explorer on the right shows the data flow structure, including `Data Flow`, `Ajax`, `JSON Parsers`, `Queries`, `Text`, `Database`, `Data Man`, `Main`, `MainChildren`, `Globals`, and `Man`.

**Text Box:**

For the USCG case, the algorithms in the first second level of scraping are creating empty cells instead of extracting the intended data.

# Helium Scraper -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
PARTIAL	NO	PARTIAL	Easy	38.70	150.00	6.93	7.53	YES	YES	2000	High	High	NO
NO			3	188.70		14.47		1	3	1	3	3	1

## Remarks:

1. This program requires the creation of the main and child programs for the different levels of scrpaing.
2. The automatic scraping is partially done because in the USCG website is not extracting data properly.
3. The scraping depth is partially done because in the ARC and USCG websites is not extracting data properly.
4. The documentation and the interface did not relate a function about the IP rotation function.
5. It is shown in the preliminary results that the language fidelity for Spanish and English was not good because some HTML coding traces remained in the date field after the extraction.

# JMP -> ARC website

The screenshot shows the JMP Pro interface with the 'Internet Open' dialog box open. The 'URL' field contains 'https://www.armada.mil.co/es/search/node/cocaina'. The 'Open As' dropdown menu is set to 'Web page'. In the background, a Notepad window displays HTML code for a page from Armada Nacional, including a Facebook Pixel code and a warning banner for outdated browsers. Three blue circles with numbers 1, 2, and 3 are overlaid on the image to indicate key steps: 1 points to the 'Web Page...' option in the 'Internet Open' dialog, 2 points to the 'Web page' option in the 'Open As' dropdown, and 3 points to the HTML code in the Notepad window.

In the "Internet Open" window, when the web page does not contain tables, it is necessary to use the "Web page" option to load the page source. This scraping should be done manually for each web page.

# JMP -> USCG website

The screenshot shows the JMP Pro interface with the 'Internet Open' dialog box open. The 'URL' field contains 'https://coastguardnews.com/?s=cocaine'. The 'Open As' dropdown is set to 'Data'. The 'Web Page...' option is selected under the 'Internet Open' menu. A Notepad window in the background displays HTML code for a news article from the USCG website. Red circles 1, 2, and 3 highlight the 'Web Page...' option, the URL field, and the 'Web Page...' option respectively.

In the "Internet Open" window, when the web page does not contain tables, it is necessary to use the "Web page" option to load the page source. This scraping should be done manually for each web page.

# JMP -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
NO	NO	NO	Easy	15.00	15.00	50.00	33.33	NO	NO	NO	Low	Low	NO
NO			3	30.00		83.33		0	0	0	1	1	1

## Remarks:

1. Due to the manual and individual extraction of page source for each web page, this program cannot do automatic scraping, automatic crawler nor scraping depth.
2. The scraping procedure is manual, therefore there was not any human behavior feature.
3. The language fidelity is low in both languages considering the only possible extraction is HTML (source page).

# Octoparse -> ARC website

The screenshot displays the Octoparse interface with a web browser window showing search results from 'Buscar | Armada Nacional'. The search results include a title 'Incautada más de una tonelada de cocaína en el mar Caribe' and a snippet of text. The Octoparse workflow on the right includes steps like 'Go to Webpage', 'Pagination', 'Loop Item', 'Extract Data', 'Click URLs in...', 'Click Item', 'Extract data o...', and 'Click to...'. A 'Data Preview' table is visible at the bottom, showing extracted data fields and their content.

**1** Incautada más de una tonelada de cocaína en el mar Caribe

Más de una tonelada de clorhidrato de **cocaína** fue incautada en las últimas horas en aguas del mar Caribe ... CTI de la Fiscalía, dando como resultado clorhidrato de **cocaína** de alta pureza. Esta droga, cuyo peso neto alcanzó los 1.120 kilos, ... margen de la ley, logrado la incautación de 2877 kilos de **cocaína**, en las siguientes operaciones: · 698 kilos de clorhidrato de ...

This program extracted data into a unique table including the first and second scraping levels.

First scraping level

Second scraping level

# Octoparse -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
YES	YES	YES	Easy	63.30	120.00	6.18	29.32	YES	YES	YES	High	High	YES
YES			3	183.30		35.50		1	1	1	3	3	0

## Remarks:

1. Octoparse uses the philosophy "Point-Click-Extract" to create the scraping and crawling tasks.
2. A manual Xpath correction should be done to achieve a proper scraping depth.
3. This program automatically detected the duplicates and provided an optional elimination of them.

# Parsehub -> ARC website

Parsehub interface showing the first scraping level. The left sidebar contains selectors for 'main\_template' and 'news\_details'. A 'Get Data' button is highlighted with a blue circle '2'. The main browser window shows the 'ARMADA NACIONAL DE COLOMBIA' search page with the search term 'cocaina' and a 'Buscar' button. A blue circle '1' is placed over the search results area. Below the browser, a table of extracted data is visible, with a blue circle '3' over the 'news\_name' column.

This program required a different algorithm for each scraping level.

Parsehub interface showing the second scraping level. The left sidebar contains selectors for 'main\_template' and 'news\_details', with 'Select remove\_page' and 'Click each remove\_p' highlighted. A 'Get Data' button is highlighted with a blue circle '4'. The main browser window shows the same search page, but with a blue circle '5' over a 'Test Run' button. Below the browser, a table of extracted data is visible, with a blue circle '3' over the 'news\_name' column.

# Parsehub -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
YES	YES	YES	Easy	61.77	40	21.60	22.58	YES	PARTIAL	5000	Medium	High	NO
YES			3	101.77		44.18		1	2	1	2	3	1

## Remarks:

1. Parsehub uses the philosophy "Select-Correct-Command" to create the scraping and crawling tasks.
2. This program can solve CAPTCHAs based on images automatically.
3. The Spanish fidelity for this program is medium because it presents the accents with symbols when results are obtained in Excel.

# Scrape Storm -> ARC website

This screenshot shows the Scrape Storm interface with a browser window displaying search results from the ARC website. The browser address bar shows 'https://www.armada.mil.co/es/search/node/cocaína'. The search results page has a title 'Resultados de la búsqueda' and a main heading 'Incautada más de una tonelada de cocaína en el mar Caribe'. A table below the heading lists search results with columns for 'Title' and 'Title\_link'. The table contains five entries, with the first two highlighted. A 'Page Type' dropdown is set to 'Auto Detect' and the 'Paging' dropdown is set to 'Select Button'. A 'Buy Now' button is visible at the bottom of the interface.

Title	Title_link

# Scrape Storm -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
YES	YES	YES	Medium	107.30	250.00	15.57	9.85	YES	MANUAL	2000	High	High	YES
YES			2	357.30		25.42		1	1	1	3	3	0

## Remarks:

1. Scrape Storm uses two modes. In Smart mode the program creates the algorithm for each level of scraping automatically. In Flowchart mode the program allows the user to create an algorithm using graphical interface manually.
2. This program stops the scraping to allow the user to solve CAPTCHAs manually.

# Web Content Extractor -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
PARTIAL	PARTIAL	PARTIAL	Easy	15.73	120	8.1	18.85	NO	MANUAL	2000	High	High	NO
NO			3	135.73		26.95		0	1	1	3	3	1

## Remarks:

1. Web Content Extractor uses a methodology to create the crawling rules first and after, the extraction rules. This seems to affect the capability to extract data simultaneously from the first and second scraping levels.
2. This program creates erroneous entries in the scraping results for both websites.
3. The crawling rules seem to force the program to gather wrong fields in the websites.

Incautada más de una tonelada de cocaína en el mar Caribe

Tamaño actual: 100%

Más de una tonelada de clorhidrato de cocaína fue incautada en las últimas horas en aguas del mar Caribe colombiano, en una operación combinada desarrollada por unidades de la Armada Nacional y una unidad aérea de la Armada Norteamericana, en el marco del acuerdo de interdicción marítima suscrito entre Colombia y Estados Unidos.

Los hechos se presentaron cuando una embarcación tipo "Go Fast" que se desplazaba a alta velocidad por una zona cercana a la isla de Serrana, fue detectada por una unidad aérea de la Armada de Estados Unidos. La aeronave inició la operación de interdicción marítima, dando aviso inmediato a la Armada Nacional, que desplegó una franja de sus unidades de reacción rápida al igual que un helicóptero con el fin de detener la lancha ilegal.

This program required create sitemaps for each website before scraping. Later, it was necessary to navigate through the web pages configuring selectors to program the scraping algorithm.

1	title	date	content-1										
2	Coast Guard transfers 3 smugglers and over \$6.6 million in seized cocaine	Mar 15th, 2021	The suspected smugglers are males, Dominican Republic nationals, who now face criminal charges by Department of Justice.										
3	Coast Guard offloads more than 19,600 pounds of cocaine, marijuana	Mar 23rd, 2021	Prior to the Munro's arrival in Alameda, the crew transferred 12 detainees, approximately 9,200 pounds of cocaine, and 10,000 pounds of marijuana.										
4	Coast Guard Cutter Tampa offloads \$94.6M in cocaine in Miami	Apr 20th, 2021	A maritime patrol flight spotted the vessel on April 9, and a law enforcement team from the cutter detained three men and seized 115 kilograms of cocaine.										
5	Coast Guard offloads nearly \$20 million in seized cocaine in San Juan	Apr 21st, 2021	A Customs and Border Protection Caribbean Air and Marine Branch maritime patrol aircraft crew detected a vessel in the Caribbean Sea.										
6	Coast Guard offloads \$15 million in seized cocaine in San Juan	Jul 13th, 2021	The interdiction resulted from multi-agency efforts in support of U.S. Southern Command's enhanced counter-narcotics operations.										
7	Coast Guard offloads \$51 million cocaine shipment in San Juan, Puerto Rico	Sep 3rd, 2021	This disruption and seizure is the result of multi-agency efforts involving the Caribbean Border Interagency Group and the U.S. Coast Guard.										
8	Coast Guard nabs 2 smugglers, seizes \$7.5 million in cocaine	Sep 27th, 2021	The apprehended smugglers are Dominican Republic nationals, who were charged with possession with intent to distribute.										
9	Coast Guard offloads \$3.5 million in seized cocaine in San Juan	Nov 1st, 2021	The USS Sioux City, operating with a Coast Guard LEDET 102 onboard, apprehended three men and seized 115 kilograms of cocaine.										
10	Coast Guard transfers custody of 3 smugglers, \$3.75 million in cocaine	Nov 3rd, 2021	The Coast Guard Cutter Donald Horsley crew seized 125 kilograms of cocaine after interdicting a drug smuggling vessel in the Caribbean Sea.										
11	Coast Guard Cutter Active offloads \$159 million of cocaine	Dec 22nd, 2020	Nicknamed "Lil Tough Guy," the Active's crew patrolled 10,056 total nautical miles off the coast of Central America.										
12	Coast Guard, Border Patrol seize \$1.9 million in cocaine in Puerto Rico	Jan 27th, 2021	The estimated wholesale value of the seized cocaine is \$1.9 million.										
13	Coast Guard offloads \$8.5 million of cocaine in San Juan	Jan 29th, 2021	The interdiction was the result of multi-agency efforts in support of U.S. Southern Command's enhanced counter-narcotics operations.										

This program extracted data just in the first scraping level.

## Web Scraper (Chrome extension) -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
PARTIAL	PARTIAL	PARTIAL	Medium	24.77	300.00	30.90	54.16	NO	NO	2000	High	High	NO

### Remarks:

1. This program extracted data erroneously if within the web page there is a link to extend the news content.
2. Because pagination is a beta feature, sometimes is crawling to random pages without following a logic order.
3. Content extension is not working properly in the second scraping level.

# Web Sundew -> ARC website

The screenshot displays the WebSundew 5.0.0-rc76 interface. The main window is divided into several sections:

- Project Explorer (Left):** Shows a tree view of the project structure, including folders for Local, ARC, Agents, Patterns, and USCG.
- States Graph (Center):** A diagram showing the flow of states and actions. It includes an 'Init' state with actions 'Open[ARC]', 'Load Page', and 'Close[ARC]'. This leads to 'State1', which contains a 'Loop [IteratorPattern1]' with variables for 'Title [URL] - String', 'Date [Date] - String', and 'URL\_link [URL] - Uri'. The loop leads to 'State2', which has a 'Details [DetailsPattern1]' state with a 'Content [Content] - String' variable.
- Web Page Interaction Window (Right):** Displays a preview of a web page from 'https://www.armada.mil.co/es/search/node/cocaína'. The page contains news articles about cocaine seizures and a pagination control with buttons for '1' through '9' and 'siguiente' and 'último'.
- Preliminary Results (Bottom):** A table showing the results of the crawler's execution, with columns for 'Title', 'Date', and 'URL\_link'.

This program extracted data just in the first scraping level.

Most of the time is scraping dates in the content field.

# Web Sundew -> USCG website

The screenshot displays the WebSundew 5.0.0-rc76 WebSundew Standard (build 5085) interface. The main window is divided into several panes:

- Project Explorer (left):** Shows a tree view of the project structure, including 'Local', 'USCG', 'Agents', 'US', 'Patterns', and 'Examples'. A red circle '1' is placed over the 'USCG' folder.
- Graph (center):** A state transition graph with nodes for 'Init', 'State1', and 'State2'. The 'Init' node contains 'Open[USCG]', 'Load Page', and 'Close[USCG]'. 'State1' contains a 'Loop [IteratorPattern]' with 'URL\_link [URL] - Uri', 'Load Page', and 'Pagination[SimplePagePattern]'. 'State2' contains 'Details [DetailsPattern]' with 'Title [Title] - String', 'Date [Date] - String', and 'Content [Content] - String'. A red circle '2' is placed over the 'Init' node.
- Web Page Preview (right):** Shows a preview of the 'Coast Guard News' website. The URL is 'https://coastguardnews.com/coast-guard-offloads-6-5-million-in-seized-cocaine-in-san-juan/'. The page features the 'Coast Guard News' logo and a headline: 'Coast Guard offloads \$6.5 million in seized cocaine in San Juan'. A red circle '2' is placed over the website header.
- Table (bottom left):** A table with columns 'Title', 'Date', and 'Content'. The first row contains: 'Coast Guard offloads \$6.5 million L...', 'Oct 6th, 2022 - Comments Off on C...', and 'The crew of the Coast Guard Cutter W SAN JUAN, Puerto Rico — The crew o The four men apprehended in this ca The Transnational Organized Crime A During the late night hours of Sept. 2: \*I cannot be prouder of the Winslow t'. A red circle '3' is placed over the table.
- States graph (bottom center):** A red-bordered box containing the text 'States graph'.
- Preliminary results (bottom center):** A purple-bordered box containing the text 'Preliminary results'.
- Web page interaction window (bottom right):** A green-bordered box containing the text 'Web page interaction window'.

# Web Sundew -> USCG website results

Title	Date	Content
Coast Guard offloads \$6.5 million in seized cocaine	Oct 6th, 2022	The crew of the Coast Guard Cutter Winslow Griesser and Caribbean Corridor Strike Force agents offloaded 721 pounds (327kgs)
Coast Guard offloads \$3.1 million in seized cocaine	Aug 25th, 2022	The Coast Guard offloaded 330 pounds (150kgs) of seized cocaine and transferred custody of eight suspected smugglers to
Coast Guard offloads \$22 million in seized cocaine	Aug 9th, 2022	Coast Guard Cutter Joseph Tezanos crewmembers offloaded 1,100 kilograms of cocaine, valued at \$22 million dollars, at Coast
Coast Guard offloads \$5.2 million in seized cocaine	Jul 5th, 2022	The crew of Coast Guard Cutter Joseph Tezanos offloaded 250 kilograms in seized cocaine estimated at \$5.2 million at Coast G
Coast Guard Cutter Thetis offloads \$99 million	Jun 17th, 2022	Coast Guard Cutter Thetis' (WMEC 910) crew offloads more than \$99 million in illegal narcotics, June 17, 2022, at Coast Guard
Coast Guard offloads \$5.6 million dollars	May 10th, 2022	Coast Guard Cutter Joseph Napier file photo.SAN JUAN, Puerto Rico — The crew of the Coast Guard Cutter Joseph Napier and C

Coast Guard transfers 3 smugglers, \$5.6 million	Mar 3rd, 2021	Coast Guard Cutter Heriberto Hernandez crew members offload over 200 kilograms of cocaine and transfer three smugglers to
Coast Guard cutter crews seize \$156M worth	Feb 17th, 2021	Coast Guard Cutter Bertholf boarding teams interdict a low-profile vessel in the Eastern Pacific Ocean, seizing more than 4,380
Coast Guard Cutter Campbell stops \$215 million	Feb 9th, 2021	Coast Guard Cutter Campbell (WMEC 909) returned to Kittery, Maine on February 8, 2021, following a 63-day counter-narcotics
Coast Guard, Navy offload \$211 million worth	Feb 1st, 2021	Members of Coast Guard Law Enforcement Detachment 407 (LEDET) offloads 11,400 pounds of cocaine and 9,000 pounds of ma
Coast Guard Cutter Spencer returns home	Jan 30th, 2021	Coast Guard Cutter Spencer file photo by Petty Officer 2nd Class Amanda WyrickBOSTON — The Coast Guard Cutter Spencer (W
Coast Guard offloads \$8.5 million of cocaine	Jan 29th, 2021	Coast Guard offloads 302 kilograms of cocaine valued at \$8.5 million, and transfers custody of two suspected smugglers to Cari
Coast Guard, Border Patrol seize \$1.9 million	Jan 27th, 2021	A U.S. Border Patrol K-9 rests after U.S. Ramey Sector Border Patrol agents, with the assistance of a U.S. Coast Guard HC-144 O
Coast Guard Cutter Active offloads \$159 million	Dec 22nd, 2020	Coast Guard Cutter Active (WMEC 618) members offload illegal drugs in San Diego, Dec. 15, 2020. The narcotics weighed over
Coast Guard transfers \$1.4 million in cocaine	Oct 24th, 2020	The Coast Guard Cutter Joseph Doyle transferred custody of four suspected smugglers and 50 kilograms of seized cocaine to Ca
Coast Guard transfers 6.8 million in seized cocaine	Oct 15th, 2020	The crew of the Coast Guard Cutter Venturous transfers custody of four suspected smugglers and \$6.8 million dollars of seized
Cutter Valliant returns home after interdictin	Oct 14th, 2020	The Coast Guard Cutter Valliant (WMEC-621) crew offloads approximately 1,600 pounds of seized cocaine at Coast Guard Sector
Coast Guard Cutter Dauntless nets \$59 million	Oct 11th, 2020	The crew of the Coast Guard Cutter Dauntless offloads cocaine weighing 2290 kilograms at Sector St. Petersburg Oct.
Coast Guard offloads \$48 million in cocaine	Oct 3rd, 2020	The crew of the Coast Guard Cutter Heriberto Hernandez offloaded 62 bales of cocaine weighing 1,981 kilograms and one 28-ki
Cutter Steadfast offloads more than \$67 million	Oct 1st, 2020	The Coast Guard Cutter Steadfast is seen against the San Diego skyline after the crew offloaded approximately 3,905 pounds of
Coast Guard offloads estimated \$216 million	Sep 17th, 2020	A crew member from Coast Guard Cutter Harriet Lane oversees a pallet of drugs offloaded from the ship in Port Everglades, Flor
Coast Guard offloads \$176,000 in seized cocaine	Sep 17th, 2020	A Coast Guard cutter Joseph Napier crewmember disembarks one of two suspected smugglers who were transferred along with
Coast Guard, CBP interdict cocaine on Miami	Sep 16th, 2020	The motor vessel La Temperance on the Miami River, Florida, Sept. 14, 2020. Coast Guard Sector Miami and U.S. Customs and B
Coast Guard crew offloads more than 26,000	Sep 10th, 2020	Coast Guard Cutter Bertholf crewmembers inspect a low-profile semi-submersible in international waters of the Eastern Pacific
USS Kidd, Coast Guard LEDET 401 seize \$6 million	Aug 29th, 2020	The crew of the Coast Guard Cutter Resolute offloads 225 kilograms of cocaine and at Sector San Juan Aug. 29, 2020.SAN JU
Coast Guard Cutter Hamilton offloads cocaine	Aug 27th, 2020	Coast Guard Cutter Hamilton crew members offload approximately 11,500 pounds of cocaine and approximately 17,000 pounds
Coast Guard offloads \$12 million in seized cocaine	Aug 6th, 2020	The crew of the Coast Guard Cutter Joseph Napier transferred custody of two smugglers and offloaded 430 kilograms of cocaine
Coast Guard Cutter Legare offloads nearly \$5 million	Aug 5th, 2020	Coast Guard Cutter Legare crew members offload about 3,900 pounds of marijuana in the rain, Aug. 5, 2020, Port Everglades, Fl

This program extracted data in the first and second scraping level.

# Web Sundew -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
PARTIAL	PARTIAL	PARTIAL	High	90.00	300.00	16.33	0.65	NO	NO	2000	High	High	NO
NO			1	450.00		16.98		0	0	1	3	3	1

## Remarks:

1. The state was not consistent with the selected field and erroneous content was extracted.
2. Pagination options were not useful for the ARC website.
3. Pagination options couldn't solve the news extension in the ARC website's second scraping level. Therefore, content extraction was incomplete.

# Scrapy -> ARC website

```
news_spider.py
import scrapy

class NewsSpider(scrapy.Spider):
    name = "news"
    start_urls = [
        'https://www.armada.mil.co/es/noticias',
    ]

    def parse(self, response):
        for news in response.css('div.inner'):
            yield {
                'text': news.css('a::text').get(),
            }

        next_page = response.css('li.pager-next a::attr(href)').get()
        if next_page is not None:
            next_page = response.urljoin(next_page)
            yield scrapy.Request(next_page, callback=self.parse)
```

```
C:\Windows\System32\Windc
(base) PS C:\> cd .\OpenSource\Scrapy\Test\
(base) PS C:\OpenSource\Scrapy\Test> scrapy crawl news -o arc.json
```

I was able to implement the extraction script of the titles for the first scraping level on the ARC website. More knowledge in Python is required to implement crawling and extraction in other levels.

# Scrapy -> USCG website

The image shows a code editor window with a Python Scrapy spider named `NewsSpider`. The spider's `parse` method extracts news items from the USCG website, yielding their titles, dates, and excerpts. A red circle with the number '1' is placed over the `parse` method definition.

```
import scrapy

class NewsSpider(scrapy.Spider):
    name = "news"
    start_urls = [
        'https://coastguardnews.com/?s=cocaine',
    ]

    def parse(self, response):
        for news in response.css('h2.entry-title'):
            yield {
                'text': news.css('a::attr(title)').get(),
            }
        for news in response.css('div.entry-meta'):
            yield {
                'date': news.css('::text').get(),
            }
        for news in response.css('div.entry-excerpt'):
            yield {
                'excerpt': news.css('::text').get(),
            }

        next_page = response.css('div.right a::attr(href)').get()
        if next_page is not None:
            next_page = response.urljoin(next_page)
            yield scrapy.Request(next_page, callback=self.parse)
```

Below the code editor is a terminal window showing the command to run the spider:

```
(base) PS C:\> cd .\OpenSource\Scrapy\uscg\
(base) PS C:\OpenSource\Scrapy\uscg> scrapy crawl news -o uscg.json
```

A red circle with the number '2' is placed over the terminal command.

To the right of the terminal is a console window displaying the Scrapy log output, including statistics and a summary of the scraped data. A red circle with the number '3' is placed over the log output.

]
```

This program extracted data just in the first scraping level.

All dates and excerpts contain HTML coding traces as well as parts of the excerpts' content.

# Scrapy -> Results

Mandatory features			Complexity	Implementation time [min]		Scraping time [min]		Human behavior			Language fidelity		Blocked by NPS firewall
Automatic scraping	Automatic crawling	Scraping depth	GUI	Tutorial	Solution	ARC 100 web pages	USCG 100 web pages	IP rotation	CAPTCHA solution	Delay [ms]	Spanish	English	
PARTIAL	YES	NO	High	240.00	300.00	0.95	0.04	NO	NO	NO	Low	Medium	NO
NO			1	540.00		0.99		0	0	0	1	2	1

## Remarks:

1. During scraping it creates erroneous entries in the ARC website case.
2. More programming knowledge is necessary to create the scraping depth capability.
3. Scrapy provides the fastest solution for scraping.
4. The language fidelity is a problem because there are HTML coding traces and misinterpretation of Spanish accents, and HTML coding traces when the web page is in English.

# APPENDIX M. FINDINGS ON POLYNOMIAL REGRESSIONS

## A. FINDING 1

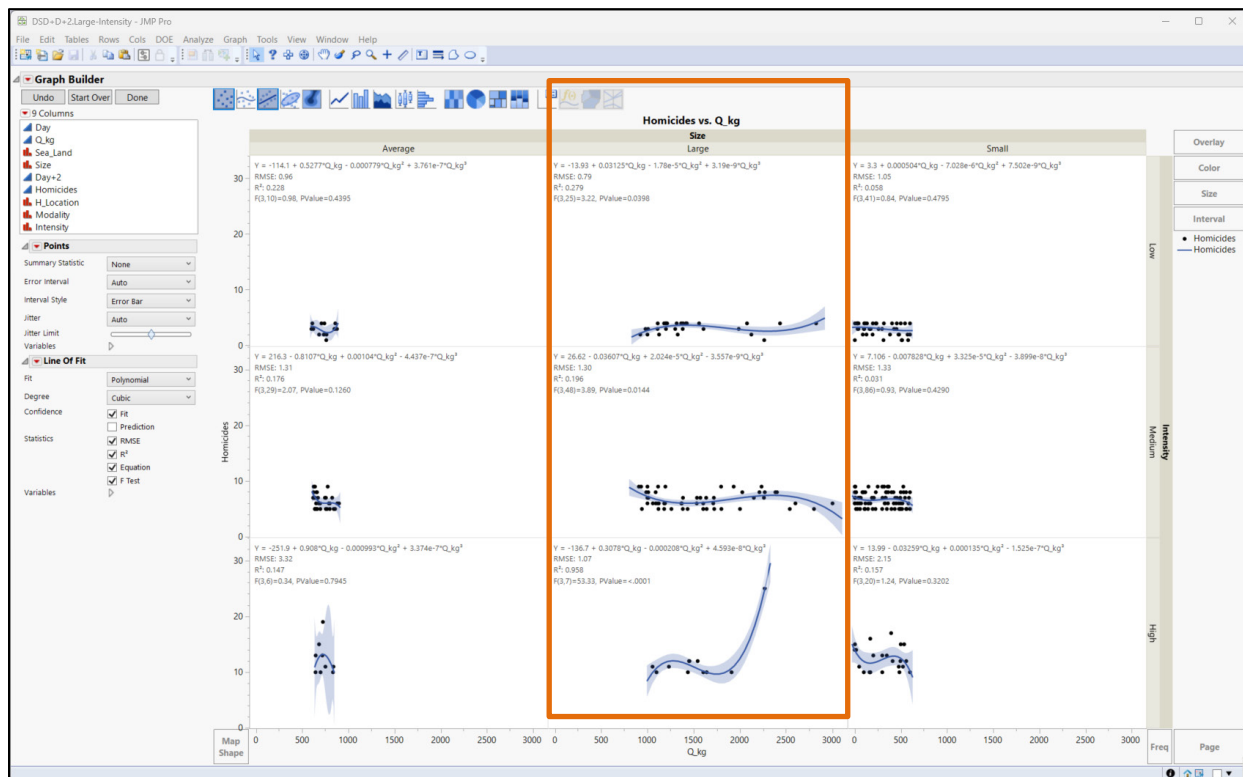

A significant correlation found between cocaine seizures on the Pacific Ocean and the rate of low-intensity homicides in the Colombian Pacific region (less than 5 homicides per day), supported by a low p-value of 0.02 and a sample size of 47 out of 308 records available (15.25%).

Nonetheless, this simple linear model only accounts for 10.3% of the variance ( $R^2$ ) in the homicide rate within the Colombian Pacific region, attributed to the cocaine seizures on the Pacific Ocean from the preceding day. The RMSE indicates an average prediction error of roughly 0.83 homicides per day.

Also, considering most cocaine seizures were reported hours after the incident, as indicated by the gathered online data, an analogous association between land and sea/land categories was expected. Therefore, despite the correlation, it is not possible to generalize this relationship as indicative of causation.

## B. FINDING 2

This second finding has a sample size of 92 out of 308 (29.87%). The absolute distribution of samples for each homicide intensity rate category is as follows: 29 out of 308 (9.41%) for low, 52 out of 308 (16.88%) for medium, and 11 out of 308 (3.5%) for high. The relative distribution of samples for each homicide intensity rate category is 29 out of 92 (31.52%) for low, 52 out of 92 (54.34%) for medium, and 11 out of 92 (11.95%) for high.

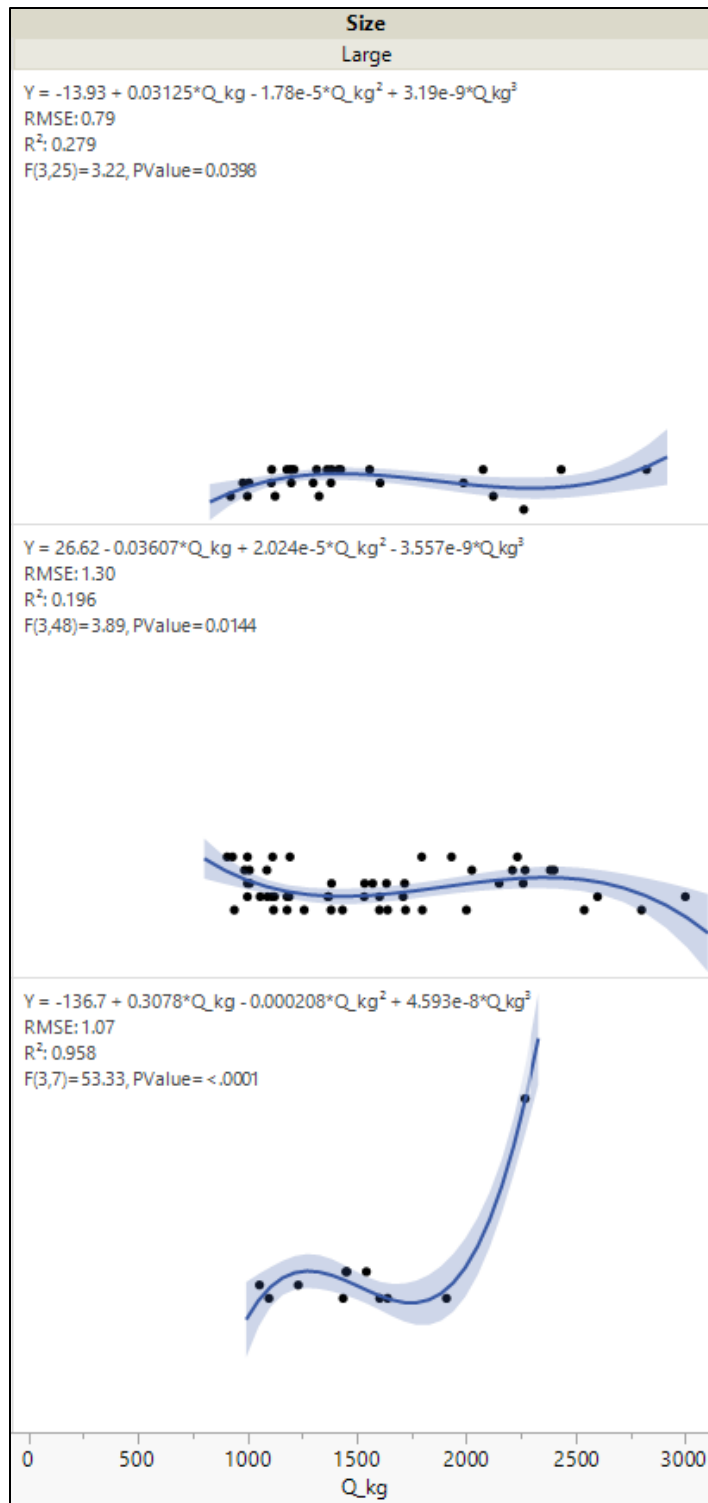

The p-values below 0.05 for both the low and medium categories of homicide intensity rates indicate noteworthy statistical support for linking large cocaine seizures with the homicide rate in the Colombian Pacific region. Moreover, the p-value below 0.001 for the high homicide rate category adds even greater support to this hypothesis.

This cubic model accounts for 27.9% of the variability in the low-intensity category ( $< 5$  homicides/day), 19.6% of the variability in the medium-intensity category ( $4 < \text{homicides/day} < 10$ ), and a significant 95.8% of the variability in the high-intensity category ( $> 9$  homicides/day) of homicides in the Colombian Pacific region attributed to large cocaine seizures ( $> 901.3$  kg) occurring two days prior.

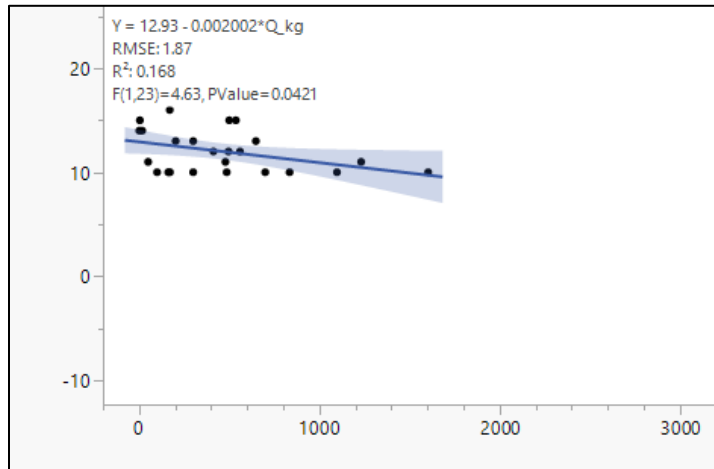

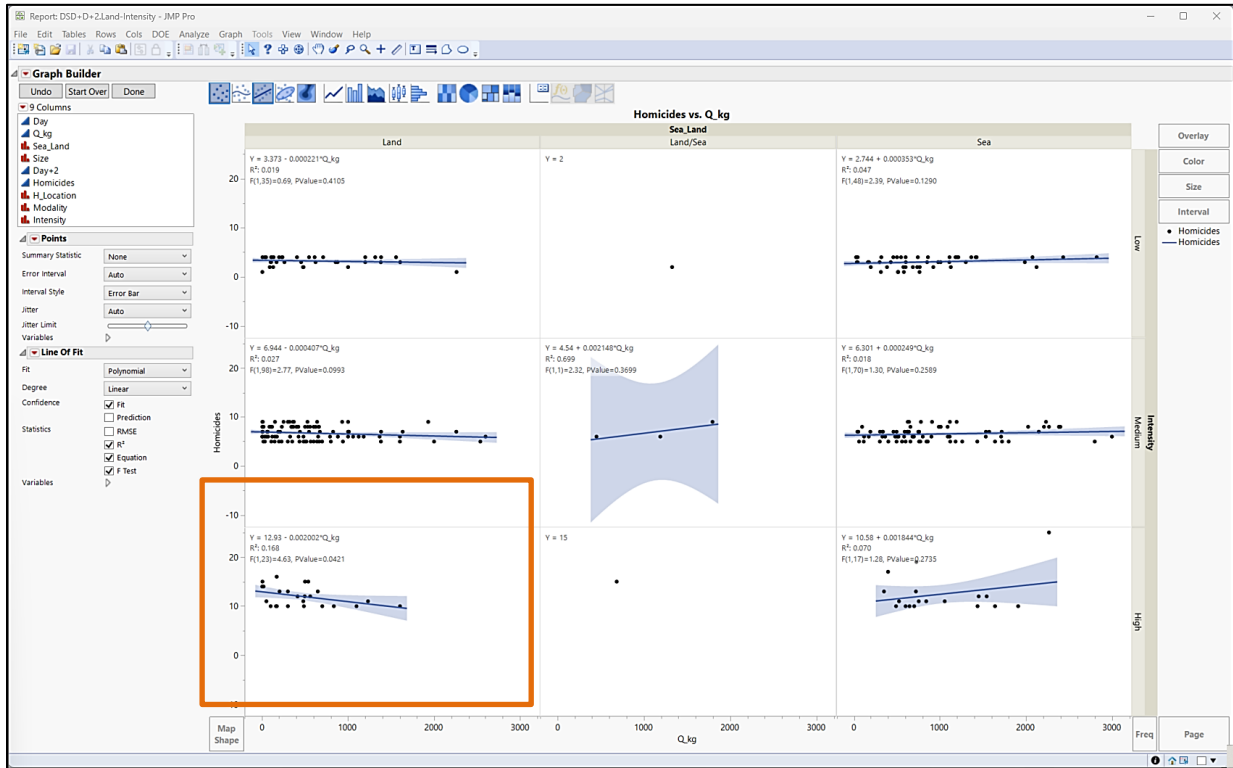

Additionally, the RMSE values for the model indicate that, on average, the predictions deviate by around 0.79 homicides/day for the low-intensity rate, 1.3 homicides/day for the medium-intensity rate, and 1.07 homicides/day for the high-intensity rate of homicides in the Colombian Pacific region.

The three cubic equations serve to illustrate the relationship between cocaine seizures and homicides in the Colombian Pacific region. As such, this discovery holds the potential to be a strong candidate for establishing a causal link between the variables under investigation.

### C. FINDING 3

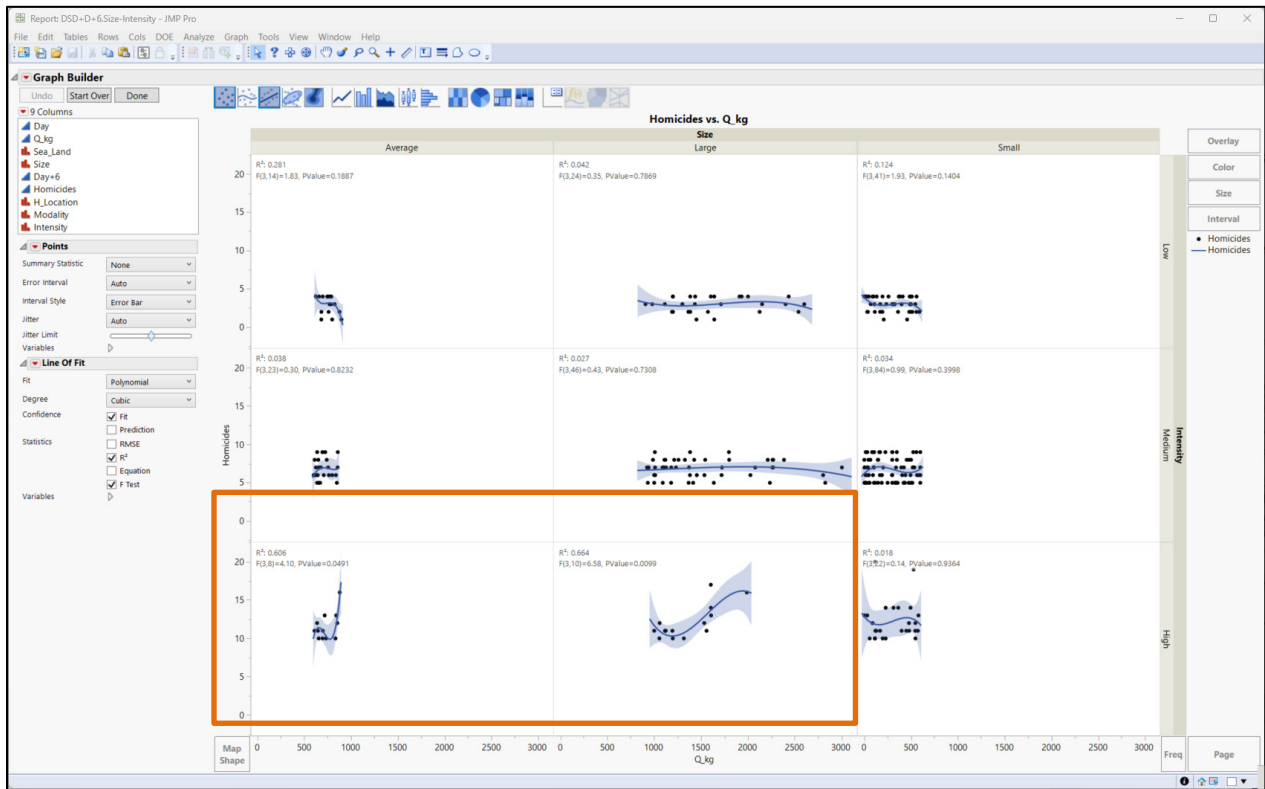

A significant correlation was found between cocaine seizures on the Colombian Pacific land and the high-intensity rate of homicides in the Colombian Pacific region (more than 9

homicides/day). This association was supported by a low p-value (0.04) and was observed in a sample of 25 out of 308 instances (approximately 8.11%).

However, this linear model only explains 16.8% of the variation in the homicide rate within the Colombian Pacific region. This variance is attributed to the cocaine seizures from the preceding two days in the Pacific Ocean. Moreover, the RMSE of the model indicates an average prediction error of roughly 1.87 homicides per day.

Given that most cocaine seizures were typically reported hours after the actual incident, as indicated by the data collected from online sources, it was anticipated that a comparable connection between sea and sea/land categories would exist. Consequently, despite the observed correlation, it is important to note that this relationship cannot be generalized to imply causation.

## D. FINDING 4

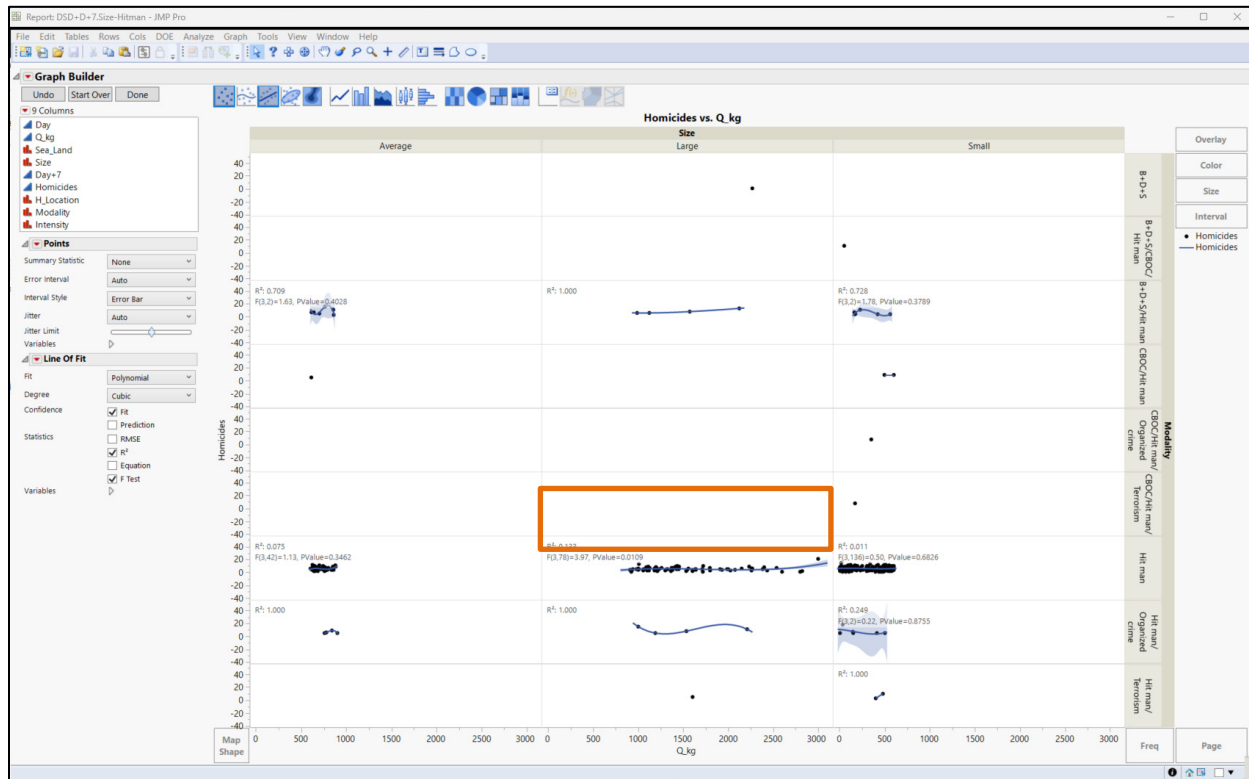

With a sample size of 26 out of 308 instances (8.44%), a p-value of less than 0.05 indicates a robust statistical significance between the occurrence of substantial cocaine seizures (> 901.3 kg) and moderate-sized seizures (601.3 kg to 901.3 kg) and the subsequent high-

intensity homicide rate in the Colombian Pacific region six days later. The absolute distribution of the cocaine seizure sizes in the sample is as follows: 12 out of 308 instances (3.89%) for average-sized seizures and 14 out of 308 instances (4.54%) for large seizures. The relative distribution of the cocaine seizure sizes within the sample is 12 out of 26 instances (46.15%) for average-sized seizures and 14 out of 26 instances (53.84%) for large seizures.

The first cubic model explains 60.6% of the variance, whereas the second model explains 66.4% of the variance in the high-intensity (more than 9 homicides per day) homicide rate in the Colombian Pacific region. These variations are attributed to the occurrences of average and large cocaine seizures that took place in the Pacific six days prior. Also, the RMSE of the models indicates that, on average, the predictions deviate by approximately 1.31 and 1.45 homicides per day for the high-intensity homicide rate in the Colombian Pacific region.

The two cubic equations could potentially illustrate the linkage between cocaine seizures and homicides in the Colombian Pacific region. Consequently, this discovery holds promise as a compelling candidate to establish a causal relationship between the variables under scrutiny.

## E. FINDING 5

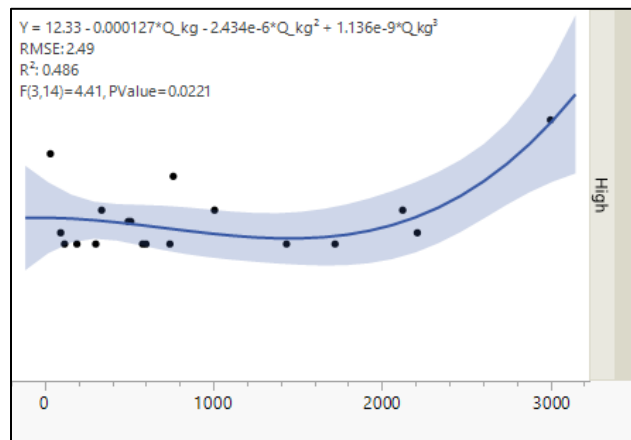

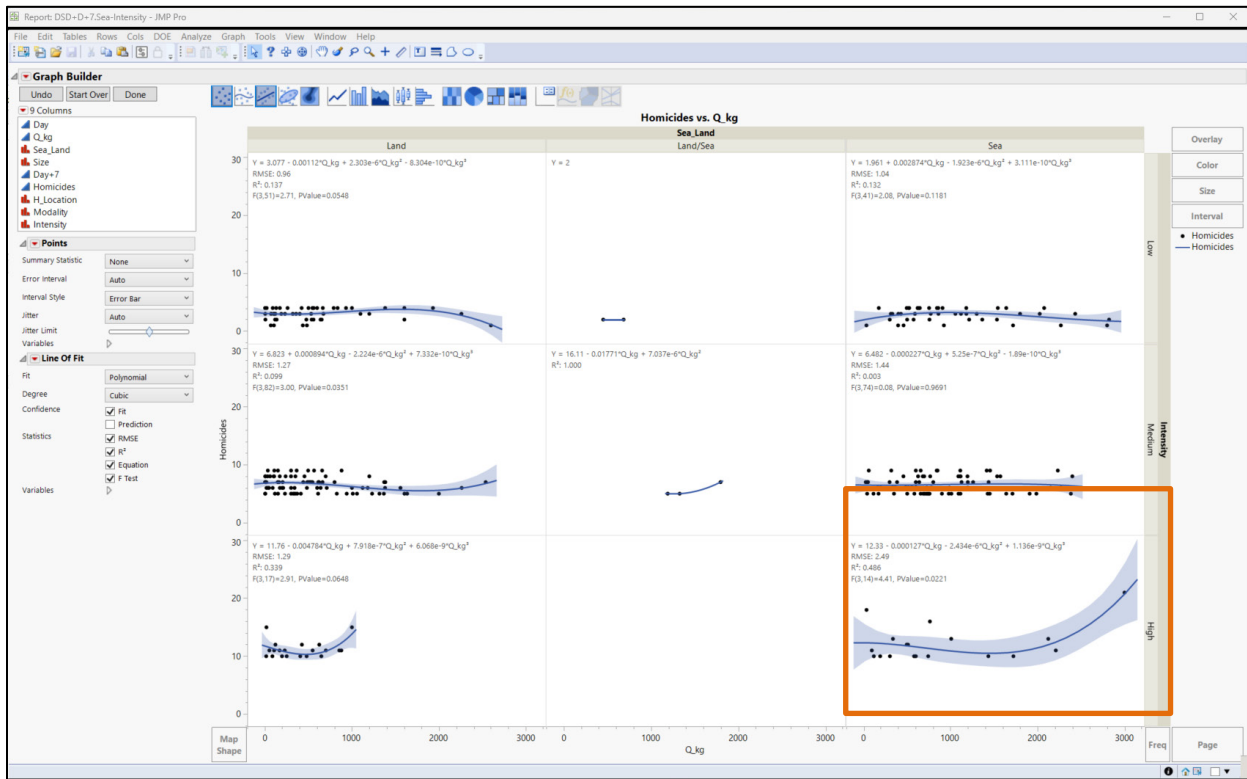

Based on a sample size of 82 out of 308 instances (26.62%), a p-value of 0.0109 indicates a strong statistical significance between the occurrence of large cocaine seizures (> 901.3 kg) and the occurrence of hitman-related homicides in the Colombian Pacific region seven days later.

However, this cubic model only explains 13.3% of the variability in the hitman-related homicides modality within the Colombian Pacific region, attributed to the occurrence of large cocaine seizures that took place in the Pacific seven days before. Also, the RMSE of the model

indicates that, on average, the predictions deviate by approximately 2.75 homicides per day for the hitman modality of homicides in the Colombian Pacific region.

While the cubic equation may reveal a potential link between cocaine seizures and homicides in the Colombian Pacific region seven days later, it is important to note that this relationship should not be extended to imply causation.

## F. FINDING 6

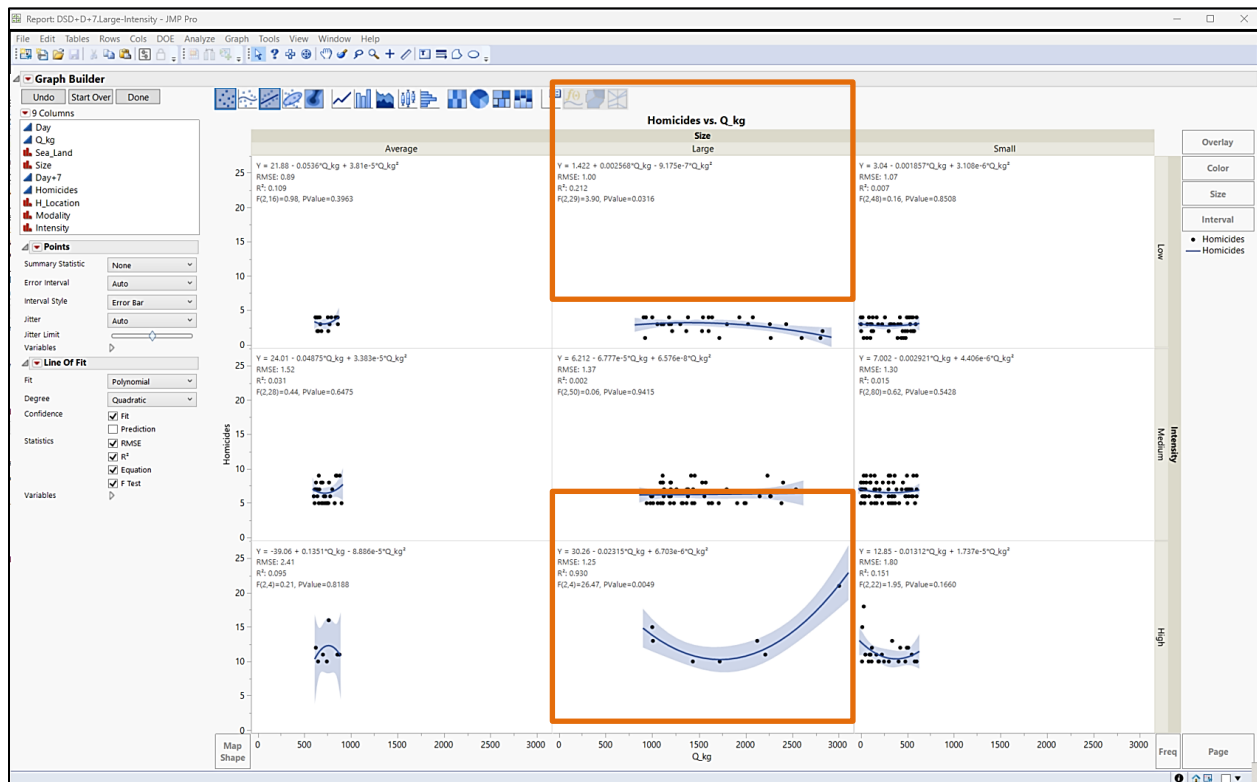

A significant correlation was found between cocaine seizures on the Pacific Ocean and the high-intensity rate of homicides in the Colombian Pacific region (more than 9 homicides per day), with a p-value (0.02) and a sample of 18 out of 308 (5.84%).

The cubic model explains 48.6% of the variance in the homicide rate within the Colombian Pacific region, attributable to the cocaine seizures that occurred in the Pacific Ocean over the preceding seven days. Moreover, the RMSE of the model indicates an average prediction error of roughly 2.49 homicides per day.

Although the cubic equation could show a connection between cocaine seizures and homicides in the Colombian Pacific region seven days after, this relationship cannot be generalized to show causality because the behavior is not consistent in the land and sea/land categories.

## G. FINDING 7

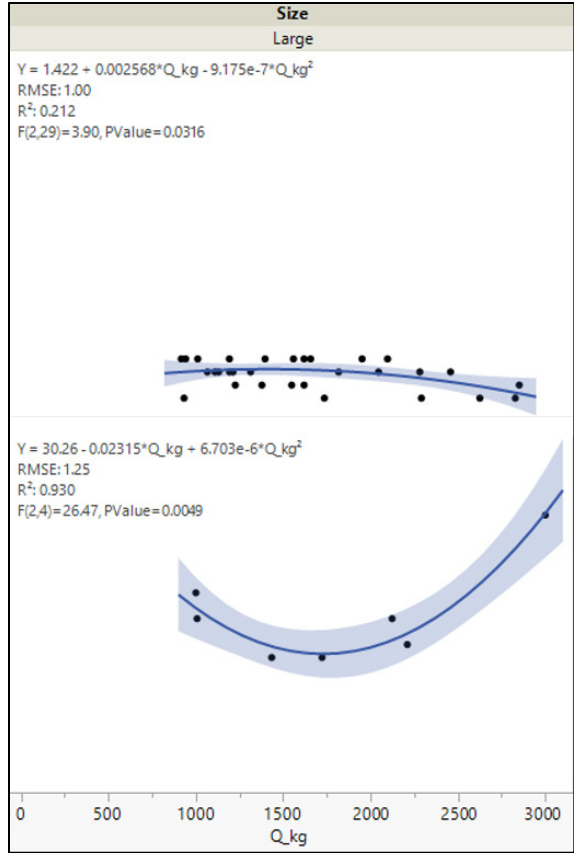

A significant correlation was found between cocaine seizures in the Pacific region and both the low-intensity (< 5 homicides/day) and high-intensity (> 9 homicides/day) rates of homicides in the Colombian Pacific region. This correlation is supported by a small p-value (< 0.05) and is based on a sample size of 25 out of 308 instances (approximately 8.11%).

The absolute distribution within the sample for the homicide intensity rates is as follows: 18 out of 308 instances (5.84%) for the low-intensity category and 7 out of 308 instances (2.27%) for the high-intensity category. The relative distribution within the sample for the homicide intensity rates is 18 out of 25 instances (72%) for the low-intensity category and 7 out of 25 instances (28%) for the high-intensity category.

The quadratic model explains 21.2% of the variation in the low-intensity homicide rate and a substantial 93% of the variance in the high-intensity homicide rate within the Colombian Pacific region. These variances are attributed to the occurrence of large cocaine seizures (> 901.3 kg) in the Pacific over the preceding seven days. Additionally, the RMSE of the model indicates an average prediction error of around 1 homicide per day for the low-intensity rate and 1.25 homicides per day for the high-intensity rate of homicides in the region.

While the quadratic equation might demonstrate an association between cocaine seizures and homicides in the Colombian Pacific Region occurring seven days later, it is important to emphasize that this connection should not be extended to imply a causal relationship. This is because there is not consistent evidence of the same effect in the medium-intensity homicide rate.

## SUPPLEMENTALS

To access the supplemental material(s) listed here, contact the [Dudley Knox Library](#) or visit the thesis pages in the [library's Calhoun database](#).

### APPENDIX H SUPPLEMENTALS

1. Supplemental 1\_Appendix\_H-1.1-Colombia-Sea  
Data scraped from ARC news website using Octoparse.
2. Supplemental 2\_Appendix\_H-1.2-Colombia-Urban  
Data scraped from PONAL news website using Octoparse.
3. Supplemental 3\_Appendix\_H-1.4-US-Sea  
Data scraped from USCG news website using Octoparse.

### APPENDIX J SUPPLEMENTALS

1. Supplemental 4\_Appendix\_J-1.1-Colombia-ARC-Hive  
ARC ETL data from Hive for cocaine seizures dataset.
2. Supplemental 5\_Appendix\_J-1.2-Colombia-PONAL-Hive  
PONAL ETL data from Hive for cocaine seizures dataset.
3. Supplemental 6\_Appendix\_J-1.4-US-USCG-Hive  
USCG ETL data from Hive for cocaine seizures dataset.

## **APPENDIX K SUPPLEMENTALS**

1. Supplemental 7\_Appendix\_K-1.1-Colombia-ARC-Excel  
ARC filtered data for cocaine seizures dataset.
2. Supplemental 8\_Appendix\_K-1.2-Colombia-PONAL-Excel  
PONAL filtered data for cocaine seizures dataset.
3. Supplemental 9\_Appendix\_K-1.4-US-USCG-Excel  
USCG filtered data for cocaine seizures dataset.
4. Supplemental 10\_Appendix\_K-Pacific cocaine seizures dataset  
Pacific cocaine seizures dataset.
5. Supplemental 11\_Appendix\_K-Colombian Pacific homicides dataset  
Colombian Pacific region homicides dataset.

## **APPENDIX L SUPPLEMENTALS**

1. Supplemental 12\_Appendix\_L-Cocaine seizures and homicides dataset  
Cocaine seizures and homicides time-series dataset.
2. Supplemental 13\_Appendix\_L-DSD+D+1  
Cocaine seizures and next day homicides time-series dataset.

3. Supplemental 14\_Appendix\_L-DSD+D+2  
Cocaine seizures and next two days homicides time-series dataset.
4. Supplemental 15\_Appendix\_L-DSD+D+3  
Cocaine seizures and next three days homicides time-series dataset.
5. Supplemental 16\_Appendix\_L-DSD+D+4  
Cocaine seizures and next four days homicides time-series dataset.
6. Supplemental 17\_Appendix\_L-DSD+D+5  
Cocaine seizures and next five days homicides time-series dataset.
7. Supplemental 18\_Appendix\_L-DSD+D+6  
Cocaine seizures and next six days homicides time-series dataset.
8. Supplemental 19\_Appendix\_L-DSD+D+7  
Cocaine seizures and next seven days homicides time-series dataset.

## **APPENDIX M SUPPLEMENTALS**

1. Supplemental 20\_Appendix\_M-DSD+D+1.Sea-Intensity  
Cocaine seizures and next day homicides time-series dataset findings on sea and intensity categories.

2. Supplemental 21\_Appendix\_M-DSD+D+2.Land-Intensity  
Cocaine seizures and next two days homicides time-series dataset findings on land and intensity categories.
3. Supplemental 22\_Appendix\_M-DSD+D+2.Large-Intensity  
Cocaine seizures and next two days homicides time-series dataset findings on large and intensity categories.
4. Supplemental 23\_Appendix\_M-DSD+D+6.Size-Intensity  
Cocaine seizures and next six days homicides time-series dataset findings on size and intensity categories.
5. Supplemental 24\_Appendix\_M-DSD+D+7.Large-Intensity  
Cocaine seizures and next seven days homicides time-series dataset findings on large and intensity categories.
6. Supplemental 25\_Appendix\_M-DSD+D+7.Sea-Intensity  
Cocaine seizures and next seven days homicides time-series dataset findings on sea and intensity categories.
7. Supplemental 26\_Appendix\_M-DSD+D+7.Size-Hitman  
Cocaine seizures and next seven days homicides time-series dataset findings on size and hitman categories.

## **APPENDIX N SUPPLEMENTALS**

1. Supplemental 27\_Appendix\_N-DSD+D+2 subset  
Cocaine seizures and next two days homicides time-series subset.
2. Supplemental 28\_Appendix\_N-DSD+D+2 subset  
Cocaine seizures and next two days homicides time-series subset graph  
builder regression.
3. Supplemental 29\_Appendix\_N-DSD+D+6 subset  
Cocaine seizures and next six days homicides time-series subset.
4. Supplemental 30\_Appendix\_N-DSD+D+6 subset  
Cocaine seizures and next six days homicides time-series subset graph  
builder regression.

## **APPENDIX O SUPPLEMENTALS**

1. Supplemental 31\_Appendix\_O-DSD+D+2 subset-Fit Least Squares  
Cocaine seizures and next two days homicides time-series subset least  
squares fitting.
2. Supplemental 32\_App. \_O-DSD+D+2 subset-Fit Least Squares no outliers  
Cocaine seizures and next two days homicides time-series subset least  
squares fitting excluding outliers.

3. Supplemental 33\_Appendix\_O-DSD+D+2 subset-Fit Least Squares no row 10  
Cocaine seizures and next two days homicides time-series subset least squares fitting excluding data point in row 10.
4. Supplemental 34\_App.\_O-DSD+D+2 subset no row 10-Distribution of  $Q_{kg}$   
Continuous distribution for cocaine seizures time-series subset excluding data point in row 10.
5. Supplemental 35\_Appendix\_O-DSD+D+2 subset (no row 10) simulation  
Simulation results table for cocaine seizures and next two days homicides time-series excluding data point in row 10.

#### **APPENDIX P SUPPLEMENTALS**

1. Supplemental 36\_Appendix\_P-DSD+D+6 subset-Fit Least Squares  
Cocaine seizures and next six days homicides time-series subset least squares fitting.
2. Supplemental 37\_App.\_P-DSD+D+6 subset-Fit Least Squares no outliers  
Cocaine seizures and next six days homicides time-series subset least squares fitting excluding outliers.

3. Supplemental 38\_Ap.\_P-DSD+D+6 subset no outliers-Distribution Q\_kg  
Continuous distribution for cocaine seizures time-series subset excluding outliers.
  
4. Supplemental 39\_Appendix\_P-DSD+D+6 subset (no outliers) simulation  
Simulation results table for cocaine seizures and next six days homicides time-series excluding outliers.
