9 **ABSTRACT**
10

11
12
13 **Background:**
14

15 Medication non-adherence is a problem of critical importance, affecting approximately 50% of all persons
16 taking at least one regularly scheduled prescription medication and costing the United States more than \$100
17 billion annually. Traditional data sources for identifying and resolving medication non-adherence in community
18 pharmacies include prescription fill histories. However, medication possession does not necessarily mean
19 patients are taking their medications as prescribed. Patient-reported outcomes (PROs), measuring adherence
20 challenges pertaining to both remembering and intention to take medication, offer a rich data source for
21 pharmacists and prescribers to use to resolve medication non-adherence. PatientToc™ is a PROs collection
22 software developed to facilitate collection of PROs data from low-literacy and non-English speaking patients in
23 Los Angeles.
24
25
26
27
28
29
30
31
32
33
34

35 **Objectives:**
36

37 This study will evaluate the spread and scale of PatientToc™ from primary care to community pharmacies for
38 the collection and use of PROs data pertaining to medication adherence.
39
40
41

42 **Methods:**
43

44 The following implementation and evaluation steps will be conducted: 1) a pre-implementation developmental
45 formative evaluation to determine community pharmacy workflow and current practices for identifying and
46 resolving medication non-adherence, potential barriers and facilitators to PatientToc™ implementation, and to
47 create a draft implementation toolkit, 2) two plan-do-study-act cycles to refine an implementation toolkit for
48 spreading and scaling implementation of PatientToc™ in community pharmacies, and 3) a comprehensive,
49
50
51
52
53
54
55
56

57 theory-driven evaluation of the quality of care, implementation, and patient health outcomes of spreading and
58 scaling PatientToc™ to community pharmacies.
59
60
61

62 **Expected Impact:**

63
64 This research will inform long-term collection and use of PROs data pertaining to medication adherence in
65 community pharmacies.
66
67
68

69 **INTRODUCTION**

70
71 Medication non-adherence is a problem of critical importance, affecting approximately 50% of all persons
72 taking at least one regularly scheduled prescription medication and costing the United States more than \$100
73 billion annually.^{1,2} Medication non-adherence is associated with clinical outcomes including hospitalizations and
74 mortality.^{3,4} It is a complex, multi-faceted problem with many causes such as forgetfulness, access/affordability
75 concerns, and avoiding medication due to bothersome side effects. Johnson's Medication Adherence Model
76 (MAM) summarizes these causes by theorizing that patients must both "remember" and "intend" to take
77 medication.⁵ The importance of reducing medication non-adherence is reflected in the Healthy People 2020
78 goals and objectives and recognized in the Centers for Medicare and Medicaid Services (CMS) star ratings
79 program for Medicare Part D prescription drug plans (PDPs).⁶⁻⁷ Plans are rated annually as achieving 1 (lowest
80 quality) to 5 (highest quality) stars. Plans receiving 5 stars are rewarded through quality bonus payments and
81 the ability for patients to switch to the plan outside of the annual open enrollment period.⁸ Several measures
82 used in determining star ratings are based on beneficiary medication adherence.⁷
83
84
85
86
87
88
89
90
91
92
93
94
95
96

97 Community pharmacists are uniquely positioned to intervene on medication non-adherence. They are widely
98 accessible and visited frequently by patients with chronic conditions, including the elderly and those without a
99 regular source of primary care.⁹ Community pharmacists can provide support for challenges commonly faced
100 by their patients such as limited health literacy, being un/underinsured, and limited English proficiency.¹⁰
101 Further, community pharmacies nationwide have increased efforts to improve measures influencing PDP star
102 measures to ensure the pharmacy is positioned for financial reward through inclusion in the PDPs preferred
103 pharmacy network and possible bonus payments.¹¹ Traditional data sources for identifying and resolving
104 medication non-adherence in community pharmacies include prescription fill histories.¹²⁻¹⁶ However,
105
106
107
108
109
110
111
112

113 medication possession does not necessarily mean patients are taking their medications as prescribed. Patient-
114 reported outcomes (PROs), measuring adherence challenges pertaining to both remembering and intention to
115 take medication, offer a rich data source to help pharmacists and prescribers resolve medication non-
116 adherence.
117
118
119

120
121
122 Although the value of collecting and utilizing PROs for clinical and research purposes has been more widely
123 recognized in recent years, to the authors' knowledge, there are no examples of widespread electronic
124 collection and use of PROs data 1) in community pharmacy settings, or 2) pertaining specifically to medication
125 adherence in ambulatory settings.¹⁷⁻²¹ In December 2016, the Agency for Healthcare Research and Quality
126 (AHRQ) released Funding Opportunity Announcement PA-17-077 which provides funding for research projects
127 to "scale and spread" successful health information technology models that use PROs in ambulatory settings.
128 Consequently, the authors received funding in April 2019 to conduct research to inform long-term collection
129 and use of PROs data pertaining to medication adherence in community pharmacies by spreading and scaling
130 a successful model (PatientToc™, described below²²) for health information technology-enabled PROs
131 collection. This research is currently in progress and is expected to be complete in March of 2022. This paper
132 provides an overview of the study aims, conceptual frameworks guiding this work, and a summary of the
133 methodology employed for Aim 1 and planned for Aims 2 and 3.

149 **STUDY AIMS**

150
151
152
153 The initial "spread and scale" of PatientToc™ to community pharmacies for the collection and use of PROs
154 data pertaining to medication adherence will be achieved through the completion of 3 study aims:
155
156
157
158

159 **Aim 1:** Conduct a pre-implementation developmental formative evaluation to determine community pharmacy
160 workflow and current practices for identifying and resolving medication non-adherence, potential barriers and
161 facilitators to PatientToc™ implementation, and create a draft implementation toolkit.
162
163
164
165
166
167
168

169 **Aim 2:** Conduct two plan-do-study-act cycles to refine an implementation toolkit for spreading and scaling
170 implementation of PatientToc™ in community pharmacies.
171

172
173
174 **Aim 3:** Conduct a comprehensive, theory-driven evaluation of the quality of care, implementation, and patient
175 health outcomes of spreading and scaling PatientToc™ to community pharmacies.
176
177

182 **METHODS**

184 **Conceptual Frameworks**

186 Three conceptual frameworks are being integrated to guide this study: 1) Curran *et al.*'s approach to Evidence-
187 Based Quality Improvement (EBQI)²³ for developing an implementation intervention, 2) The Consolidated
188 Framework for Implementation Research (CFIR)²⁴, and 3) the Conceptual Framework for Implementation
189 Outcomes described by Proctor *et al.*²⁵ The integration of these frameworks and their place in the proposed
190 study is depicted in Figure 1. First, in Aim 1, as described by Curran, a developmental formative evaluation will
191 be conducted prior to PatientToc™ implementation, followed by an evidence-based iterative process²³ to adapt
192 the intervention and implementation supports (toolkit) as needed. This “diagnostic” assessment of the
193 implementation context will consist of semi-structured interviews and observations informed by the CFIR. The
194 CFIR is a well-established framework that classifies implementation constructs across five domains which
195 research has indicated influence implementation, providing a structure to systematically assess implementation
196 contexts. The five domains are: *intervention characteristics* (e.g., evidence strength, adaptability), *outer setting*
197 (e.g., health policy, patient resources), *inner setting* (e.g., clinic culture, leadership engagement),
198 *characteristics of the individuals involved* (e.g., knowledge and beliefs, self-efficacy, attributes such as
199 motivation and learning style), and *the processes of implementation* (e.g., training, mentoring, prompting,
200 facilitating).²⁴ The CFIR domains will also form the basis of a deductive-inductive analytic approach (described
201 below) in Aim 1. A multi-stakeholder advisory panel, comprised of small advisory groups from each of the three
202 states, will also be convened and will consider the data collected in Aim 1 and help to develop an initial
203 PatientToc™ implementation toolkit to be used and refined in Aim 2. Based on the EBQI process²⁶⁻²⁷ the panel
204 will be comprised of pharmacist, pharmacy technician, and patient representatives (“end users”), experts in
205 PatientToc™, and experts in implementation. They will meet on a regular basis during Aim 2. As the two EBQI

222
223
224

225 plan-do-study-act (PDSA) cycles will be completed with a small number of pharmacies, the multi-stakeholder
226 panel will receive the data generated in the PDSA cycles and work to iteratively refine the approach to
227 PatientToc™ implementation prior to scaling to more community pharmacies (Aim 3). Data collected during the
228 PDSA cycles (and during the Aim 3 scale out) will cover a range of implementation outcomes as recommended
229 by Proctor et al.'s Conceptual Framework for Implementation Outcomes.²⁵ Specifically, in the Proctor model,
230 "client outcomes" are influenced by "service outcomes," which are influenced by "implementation outcomes."
231 Implementation outcomes include: acceptability, feasibility, appropriateness, adoption, fidelity, penetration,
232 sustainability, and cost; these are measured at different stages of implementation (e.g., early stage for
233 appropriateness, late stage for sustainability.)²⁵

243

244 **Description of PatientToc: Current Use in Physician Offices**

245 PatientToc™ is a PROs collection software developed by investigators from the L.A. Net Community Health
246 Resources Network, a primary care PBRN in California.^{22,28} PatientToc™ was developed to facilitate collection
247 of PROs data from low-literacy and non-English speaking patients in Los Angeles. L.A. Net provided a design
248 for the product based on experience collecting PROs from more than 10,000 patients in L.A. Net practices
249 speaking 42 different languages. The system was developed over a period of 4 years with continuous input
250 from clinicians, community health workers, patients and researchers. PatientToc™ is used in waiting rooms,
251 pre-visit areas, exam rooms, and educator rooms. Patients interact with a 10-inch android tablet that is either
252 hand held or installed in a case or holder attached to a table. Consistent with research on low-literacy,²⁹⁻³⁰ the
253 system presents one question at a time, and read aloud functionality for multiple languages is available.
254 Patients use disposable ear buds to maintain confidentiality when they use the read aloud function. The
255 system can deliver any PROs and responses are transmitted real time to the PatientToc™ server where staff
256 and clinicians can access the results both as a pdf replica of a paper version of the completed survey, and as
257 an aggregated SQL or Excel database. PatientToc™ integrates with EHRs via Health Level Seven (HL7)
258 standards or Fast Healthcare Interoperability Resources (FHIR) interfaces, and through third party integration
259 with service provider systems. Currently, PatientToc™ is being used in over 36 practices including 2 Federally
260 Qualified Health Centers. Two California health plans also used the system to transmit mandatory initial health
261 assessments. It is an estimated that approximately 10,000 patients have completed PROs on PatientToc™
262 tablets, including the: PHQ-9, Medicare Health Risk Assessments, SBIRT screening, and others.

278
279
280

281
282 **Description of Planned Spread of PatientToc™ to Community Pharmacies & Pharmacist Intervention**
283

284 While specific implementation features will be informed by the findings of Aims 1 and 2, we anticipate
285 implementation and scaling of a two-fold intervention. First, patients will complete PROs (described below) in
286 PatientToc™ upon arrival at the pharmacy to drop off or pick up a prescription. Data from PatientToc™ will
287 then be either transmitted electronically to pharmacists through integration of PatientToc™ and the pharmacy's
288 dispensing system or printed via a wireless printer. Second, the pharmacist will review the PROs data and
289 immediately use this information to inform patient counseling, making any relevant interventions to improve
290 medication adherence at that time. For example, patients may report non-adherence due to medication cost.
291 During counseling, the pharmacist may be able to identify discount coupons for the medication and/or assess
292 and recommend less expensive options for consideration by the patient's physician.
293

295
296
297
298
299
300
301
302
303

304 **Aim 1**
305

306 As noted, community pharmacies offer an excellent, novel, ambulatory setting for the collection and immediate
307 use of PROs data pertaining to medication non-adherence. The thoughtful, systematic spreading of a
308 successful model for health information technology-enabled PROs collection and utilization from primary care
309 to community pharmacies in diverse settings, guided by stakeholders to ensure consideration of local context,
310 provides a critical "proof of concept" for other community pharmacies. Starting with a pre-implementation
311 developmental formative evaluation will enable us to better understand the current context of community
312 pharmacy practice and potential barriers, facilitators, and recommendations for PatientToc™ implementation.
313 Aim 1 activities were approved as an exempt research protocol by the [name removed for peer review]
314 Institutional Review Board and partnering organizations have either also approved the protocol as exempt
315 research or indicated that review and approval is not required.

321
322
323
324
325
326

327 **Outcome Measures & Products**
328

- 329 1. Formation of a multi-stakeholder (pharmacist, pharmacy technician, and patient) advisory panel, with
330 representatives from Indiana, Minnesota, and Wisconsin, to guide the implementation of PatientToc™ for
331 the duration of the project period.
332
333
334
335
336

- 337 2. Qualitative themes pertaining to potential barriers, facilitators, and recommendations for PatientToc™
338 implementation in community pharmacies.
339
340 3. Creation of a draft toolkit for adapting and implementing PatientToc™ in community pharmacies.
341
342
343

344 **Participants & Sampling**

345 *Description of Participating Practice Sites/PBRNs*

- 348 1. L.A. Net Community Health Resource Network (L.A. Net) and PatientToc™: Established in 2002, L.A. Net
349 practices are comprised of private practices, federally qualified health centers, and community health
350 centers.²⁸ L.A. Net staff led the development of PatientToc™ and since 2012, PatientToc™ has been used
351 in 36 of L.A. Net's 116 practices across L.A. to collect PROs from safety net patients.
352
353
354
355
356 2. Medication Safety Research Network of Indiana (Rx-SafeNet): Launched in 2010 as an Affiliate Network
357 registered with the AHRQ PBRN Resource Center, Rx-SafeNet is one PBRN administered by the Indiana
358 Clinical and Translational Sciences Institute and is comprised of approximately 145 community pharmacy
359 locations throughout Indiana.³¹⁻³⁵
360
361
362
363
364 3. Minnesota Pharmacy Practice-Based Research Network (MPPBRN): The MPPBRN was established in
365 2008 as a collaboration between pharmacists, the Minnesota Pharmacists Association, and the University
366 of Minnesota. MPPBRN is comprised of 366 pharmacists located throughout Minnesota.³⁶
367
368
369
370 4. Selected community pharmacies in Wisconsin: Members of the study team previously founded and
371 directed a PBRN and maintain close working relationships with many of those pharmacies and others in
372 Wisconsin. A small sample of these pharmacies are participating.
373
374
375
376

377 *Recruitment of L.A. Net Practices and Community Pharmacies for Participation*

378 To better understand how PatientToc™ has been implemented in primary care and likely barriers, facilitators,
379 and recommendations for spreading PatientToc™ to community pharmacies, a purposeful sample of L.A. Net,
380 Rx-SafeNet, MPBRN, and Wisconsin locations to visit were recruited. Specifically, two L.A. Net practices with
381 differing approaches to PatientToc™ implementation and three pharmacies from each state, representing a
382 wide range of community pharmacy practice types (e.g., independent vs. health-system outpatient pharmacy,
383 urban vs. rural, etc.) were recruited following usual practices of each PBRN (mirrored for Wisconsin.)
384
385
386
387
388
389
390
391
392

Data Collection Procedures

Semi-Structured Interviews, Rapid Ethnography, and Contextual Inquiries

A purposeful sample (targeting n=5 clinicians/staff and n=5 patients per site) of practitioners, staff, and chronically ill patients from participating practices/pharmacies were invited to participate in one-day site visits, including 30 to 60 minute one-on-one semi-structured interviews. Field notes were taken. Interviews and contextual inquiries³⁷ occurred on-site during visits. Contextual inquiries occurred while routine pharmacy tasks were conducted. Questions centered on the tasks being performed, decisions made, and alternatives considered, with conversations focused on pharmacy workflow and how tasks could be supported or impeded by future implementation of PatientToc™. Interview guides were designed to elicit opinions pertaining to experiences with PatientToc™ implementation (for L.A. Net stakeholders) and anticipated barriers and facilitators, as well as recommendations pertaining to future PatientToc™ implementation at community pharmacies within CFIR domains. Interview guides were pilot tested and refined prior to use. Example interview questions related to each broad CFIR domain are provided in Box 1. All interviews and contextual inquiries were audio-recorded with permission of the participant and subsequently transcribed by a professional company and reviewed for accuracy. Field notes were also reviewed by investigators following each visit in order to create an audio-recorded site observation debrief which was also transcribed for analysis. Study team members met after completing site visits to each state to review transcripts and discuss plans for subsequent site visits. Participant demographics were collected at the conclusion of each interview, and entered into SPSS [v. 23, Cary, NC.]³⁸ All data (both written and audio) were collected using iPads through secure, HIPAA-compliant mobile applications. Specifically, field notes and demographic data were collected using Research Electronic Data Capture (REDCap) software³⁹ and audio-recordings were captured using the transcriptionist company's secure, mobile dictation application. Pharmacies were offered \$500 to offset time spent by staff in data collection activities; individual staff were not compensated. Patient participants were offered a \$10 gift card. Aim 1 data collection procedures were completed in November 2019 and data analyses are in progress.

Formation of Multi-Stakeholder Advisory Panel

A multi-stakeholder advisory panel is being formed to represent patient and pharmacist/pharmacy staff perspectives. The panel, which will participate in the EBQI process (described further below) will consist of 1-2

449 participants (pharmacists, pharmacy technicians, patients) from each pharmacy participating in Aim 1, as well
450 as a sub-set of investigators.
451
452
453

454 ***Analytic Procedures***

456 Interview transcripts, contextual inquiries, and observation notes were coded using accepted qualitative
457 methods. Specifically, data coding was conducted by three trained research assistants with coding decisions
458 reviewed for a subset of transcripts by three investigators. A combination of deductive (e.g., constructs from
460 the CFIR) and inductive (emergent from the data) approaches were used to establish the coding structure and
462 care was taken to modify, create, or collapse codes as necessary.⁴⁰ SPSS [v. 23, Cary, NC]³⁸ was used to
465 summarize descriptive statistics for participant demographic data to better understand potential implementation
466 contexts and to guide qualitative analysis (e.g., exploring any differences in findings across stakeholder type.)
468
469
470
471

472 ***Synthesis of Findings & Creation of Draft Implementation Toolkit Using the Evidence-Based Quality***

473 ***Improvement Process (EBQI)***

475 Data synthesis and identification of emergent themes is ongoing. Qualitative coding results from observations,
476 contextual inquiries, and semi-structured interviews are being examined to identify overarching themes.
478 Through this process, the intent is to also examine data for differences in findings across methods used (e.g.,
480 did observations identify differing themes as compared to what was communicated during interviews) and
482 across different types of pharmacies/clinics/implementation approaches. Resulting themes will inform the EBQI
484 process to create a draft implementation toolkit (i.e., detailed description of implementation considerations) for
486 refinement in Aim 2.
487
488
489
490

491 As previously described by others,⁴¹⁻⁴² EBQI is a quality improvement approach which leverages the unique
492 expertise of each stakeholder involved in the process of intervention implementation: 1) the “end users” from
493 the implementation context (i.e., community pharmacists, pharmacy technicians, and patients from pharmacies
495 interested in PatientToc™ implementation), 2) intervention experts (i.e., L.A. Net leadership with expertise in
497 PatientToc™) and 3) implementation experts, comprised of experts in implementation science and community
499 pharmacy practice from the study team. Throughout the EBQI discussions, the “evidence-base” and rationale
501 for considering PatientToc™ implementation will be presented by L.A. Net leadership to help secure buy-in
502
503
504

505 among the end users. Findings from the diagnostic analysis (Aim 1) will then be presented and pharmacists,
506 pharmacy technicians, and patients will be asked to comment and prioritize the information gleaned on
507 potential facilitators, barriers, and implementation recommendations. This process ultimately will guide
508 decision-making about 1) how the intervention needs to be adapted, and 2) what implementation strategies are
509 to be considered for the initial implementation toolkit. Parameters for adaptations and implementation
510 strategies will be informed by the intervention and implementation experts to ensure feasibility and alignment
511 with scientific literature.
512
513
514
515
516
517
518
519

520 **Aim 2**

521
522 The pre-implementation developmental formative evaluation in Aim 1 will provide critical learnings pertaining to
523 the context for spreading PatientToc™ to community pharmacies. The next step in the spread and scale
524 process will be to implement PatientToc™ in a small number of community pharmacies, using a plan-do-study-
525 act (PDSA) approach.⁴³ This will facilitate resolution of implementation challenges and refinement of the
526 implementation toolkit for use in subsequent scaling. Specific changes cannot be fully elucidated until
527 PatientToc™ has been implemented and initial observations and interviews conducted. That said, it is
528 expected that ongoing adjustments through the PDSA cycles will be made for at least three components of
529 implementation: 1) data integration between PatientToc™ and the pharmacy dispensing systems (e.g.,
530 ensuring accurate and complete population of medication data in PatientToc™), 2) PatientToc™ logistics
531 pertaining to medication adherence PROs measures (e.g., skip patterns, automatic computation of the
532 medication regimen complexity index (MRCI, described below), and 3) considerations for optimizing when and
533 how PROs data should be presented in the pharmacy dispensing system for use in counseling and
534 whether/what types of decision support should be provided along with the PROs data to facilitate pharmacist
535 intervention. Ethics review for Aims 2 and 3 is pending but approval using a single IRB process, as well as
536 registration with clinicaltrials.gov, will occur prior to the initiation of Aim 2 activities.
537
538
539
540
541
542
543
544
545
546
547
548
549
550
551

552 **Outcome Measures**

553 This Aim will focus on *Implementation* outcomes as PDSA findings will inform subsequent scaling of
554 PatientToc™. *Quality of Care* and *Patient Health Outcomes* will be secondary outcomes. Collection of the
555 latter outcomes during the PDSA cycles will simulate collection for the final evaluation in Aim 3. Planned
556
557
558
559
560

561 outcome measures are summarized in Box 2; additional secondary outcomes might be added. Plans for
562 operationalizing these outcomes are still being finalized and adjustments to these plans might be made after
563 the completion of Aim 1.
564
565
566
567

568 ***Participants & Sampling***

569 *Recruitment of Community Pharmacies for Participation*

570 As described for Aim 1 (same approach), a purposeful sample of 2-3 practices will be recruited from each state
571 (Indiana, Minnesota, Wisconsin) to implement PatientToc™ and participate in the PDSA cycles. The current
572 plan is to begin recruitment by reaching out to the same pharmacies that participated in Aim 1.
573
574
575
576
577

578 *Patient Recruitment*

579 The specific pharmacy workflow for introducing patients to PatientToc™ will be informed by Aim 1 findings and
580 the EBQI process, and may vary by participating pharmacy. For example, all pharmacy patients might have the
581 opportunity to complete PROs in the tablet if desired with only a subset included in the evaluation. For the
582 purposes of this evaluation, data will be sought from patients who are 1) ≥ 50 years of age, and 2) have one or
583 more specific chronic conditions (i.e., hypertension, Type 2 diabetes, and dyslipidemia) requiring routine, oral,
584 prescription medication filled by the study pharmacy as 30-day supplies. Approximately 15 patients per
585 participating pharmacy per PDSA cycle will be recruited. Patients meeting these criteria will be required to
586 provide informed consent and HIPAA authorization prior to their data being used in analysis. The study team is
587 also considering the potential for caregivers and/or pharmacy staff to complete PROs on behalf of patients; this
588 decision will be informed by Aim 1 findings.
589
590
591
592
593
594
595
596
597
598
599
600
601
602

603 ***Data Collection Procedures***

604 *Procedures for PDSA Cycles*

605 Guided by the draft implementation toolkit created through Aim 1 (“Plan”), PatientToc™ will be implemented
606 (“Do”) at the pharmacy locations recruited for this Aim. While specific touch points and resources will be
607 informed by Aim 1, the following are planned to support implementation:
608
609
610
611
612

- 613 • Assignment of specific research assistant/practice facilitator to each participating pharmacy to serve as
614 their primary point of contact for implementation questions and concerns
615
616

- 617 • Weekly, individual phone calls and bi-weekly in-person visits between investigators/project staff and each
618 participating pharmacy
- 619
- 620 • Bi-weekly webinars open to all participating pharmacies to share implementation success stories and
621 challenges and receive feedback from investigators and project staff. A portion of these webinars will be
622 accredited as continuing education for pharmacists and pharmacy technicians.
- 623
- 624
- 625
- 626 • Continued quarterly meetings with advisory panel
- 627
- 628 • Compensation to pharmacies to support participation in project activities
- 629
- 630

631
632 Implementation and data collection for the first PDSA cycle will occur over a three-month period. Using these
633 findings (“Study”), the implementation toolkit will be refined (“Act”) through the EBQI approach described in Aim
634 1 to guide implementation of a second PDSA cycle (three months) and this process will be repeated.
635
636
637
638

639 *Implementation Outcomes*

640
641 Following the same general procedures described for Aim 1, above, qualitative data will be collected during
642 phone calls, webinars, and visits to participating pharmacies. The following administrative data will be collected
643 from the PatientToc™ system and/or practice facilitator records: number of unscheduled contacts made with
644 sites to discuss problems/issues, number of patients approached/enrolled/consented, number of PROs
645 measures completed/skipped items, number of days during PDSA when PatientToc™ accessed, whether
646 PROs data reviewed by pharmacist while patient in pharmacy, and costs associated with PatientToc™
647 implementation.
648
649
650
651
652
653
654

655 *Quality of Care Outcomes*

656
657 All outcome measures (Box 2) will be collected for each participating pharmacy on approximately the last day
658 of each month for the duration of each PDSA cycle (3 months per cycle).
659
660
661
662
663
664

665 *Patient Health Outcomes-PROs*

666
667 Four PROs pertaining to medication adherence will be collected using PatientToc™ during the PDSA cycles. It
668 is envisioned that these will be completed by patients monthly. The order in which these PROs will be
669 presented to patients, as well as which specific medications in a patient’s regimen they will be requested for,
670
671
672

673 are still being discussed by the study team and will be informed by the Aim 1 EBQI process. The PROs
674 measures include:
675

676
677
678 Measures focused on “Remembering” to take medications:
679

- 680 1. Brief Medication Questionnaire (BMQ) regimen screen: The BMQ regimen screen is scored from
681 responses to 5 items asking patients to consider their medication adherence for each regularly scheduled
682 prescription medication over the past 7 days. If non-adherence is reported for any medication, the patient is
683 considered “non-adherent.” To facilitate electronic capture of patient responses to the BMQ in PatientToc™
684 and minimize redundancy with other PROs collected, fewer items from the regimen screen and/or select
685 items from other screens on the BMQ might be used. However, the final BMQ score will be computed as a
686 dichotomous measure of adherence. The BMQ has been widely published and is correlated with
687 adherence measured by prescription fill data.⁴⁴
688
689
- 690 2. Merck Medication Adherence Estimator®: The Adherence Estimator® is a 3-item 6-point Likert-type scale
691 for measuring self-reported adherence barriers pertaining to cost, concerns, and commitment.⁴⁵ Those
692 scoring ≥ 8 are considered at “high likelihood for non-adherence.” It is validated for use by patients with
693 common chronic, asymptomatic conditions (e.g., diabetes).
694
695
- 696 3. Medication Regimen Complexity Index (MRCI) (automated): The MRCI is a 65-item tool measuring
697 regimen complexity across three components: form/route, dosing frequency, and special instructions.⁴⁶
698 Patients will be prompted to verify their medication regimen on the tablet. PatientToc™ will be programmed
699 to automatically compute a score for the MRCI. The lowest possible score is 1.5 with no maximum score,
700 and increasing scores are associated with worsening medication adherence.⁴⁶ Others have described
701 experience with automating the MRCI and automation considerations.⁴⁷
702
703
704
705
706
707
708
709
710
711
712
713
714
715
716

717 Measure focused on “Intending” to take medications:
718

- 719 4. Adverse Drug Reaction Event Side Effect Screener (ADDRESS): ADDRESS scores will provide a measure
720 of total medication side effect distress burden as defined by summing the product of side effect frequency
721 and side effect severity for each medication it is completed for.⁴⁸⁻⁴⁹
722
723
724
725
726

729 When available, EQUIPP™ medication adherence data will also be collected for participating pharmacies.

730 EQUIPP™ is a program, administered by Pharmacy Quality Solutions, Inc., that provides community
731 pharmacies with report cards for their performance contributing to PDP star measures. We will specifically
732 collect data for measures of medication adherence, including the percent of Part D beneficiaries achieving
733 ≥80% adherence on oral diabetes, hypertension, and cholesterol medications.⁵⁰
734
735
736
737
738

739 ***Analytic Procedures***

740 Analysis of qualitative data will follow the same general procedures as described for Aim 1. Descriptive
741 statistics will be computed for all quantitative data including: administrative data from PatientToc™, quality of
742 care outcomes, scores on PROs, and EQUIPP™ data. Pharmacy means for each quality of care outcome and
743 EQUIPP™ data will be compared using paired t-tests or Wilcoxon signed-rank tests to pharmacy data for the
744 same time period one-year prior.
745
746
747
748
749
750
751

752 ***Synthesis of Findings***

753 Similar to Aim 1, qualitative findings will be synthesized and triangulated with quantitative findings for
754 consideration during the EBQI process. This will result in further refinements to the implementation toolkit for
755 subsequent scaling and final evaluation in Aim 3.
756
757
758
759
760
761
762

763 **Aim 3**

764 Gaining experience with both the spread of PatientToc™ to community pharmacies, as well as the scale to
765 approximately 30 pharmacies diverse in geography and patient populations, is critical in understanding the
766 potential sustainability in community pharmacies.
767
768
769
770
771

772 ***Outcome Measures***

773 This Aim will focus on *Patient Health Outcomes* to evaluate the impact of scaling PatientToc™ to a greater
774 number of community pharmacies and patients.
775
776
777
778
779
780

781 **A) Primary Outcomes (select Patient Health Outcomes):**

- 782 1. Self-reported medication adherence, measured by the BMQ regimen screen (described above)
- 783
784

785 2. Self-reported total side effect distress burden, measured by ADDRESS (described above)

786
787
788 B) Secondary Outcomes

789
790 Implementation Outcomes

791
792 Measures collected for Aim 2 will be collected again with the addition of:

793
794 1. Penetration (i.e., integration of PatientToc™ within community pharmacies), measured by descriptive
795 statistics on pharmacy-level utilization of PatientToc™ (e.g., percent of pharmacist shifts)

796
797
798 2. Sustainability (i.e., extent to which PatientToc™ is maintained within community pharmacies), measured by
799 the number of consecutive months goal level of patient participation achieved

800
801
802
803
804 Quality of Care Outcomes & Additional Patient Health Outcomes

805
806 *Same as described for Aim 2, above*

807
808
809
810 **Participants & Sampling**

811
812 *Recruitment of Community Pharmacies & Patients*

813
814 Using the same procedures as for Aim 2, up to 10 total community pharmacies per state will be recruited to
815 participate. Frequency of touch points will be adapted based on Aim 2 findings. Pharmacies and patients
816 recruited for Aim 2 will also be followed for the final (Aim 3) evaluation period (7 months, described below) but
817 possibly with fewer touch points. Patient eligibility criteria is expected to be the same as for Aim 2.
818
819

820
821
822
823 *Sample Size Justification*

824
825 There are two primary endpoints for this study, overall medication adherence (yes/no) (measured by the BMQ)
826 and total medication side effect distress burden (measured by ADDRESS), thus an alpha level of $0.05/2=0.025$
827 is used in the power calculation. For overall adherence, the study will be powered based on using a
828 McNemar's Test at the patient level. Performing the analyses at the visit level (PROs are collected at each
829 visit) will improve power as will taking the modeling approach below that adjusts for covariates. A change in
830 overall adherence rates of 10% is considered clinically important. Assuming the probability of switching from
831 adherent to not adherent is 0.1 and not adherent to adherent is 0.2 from pre- to post-intervention (overall
832 discordance proportion of 0.3), power of 80%, alpha level of 0.025, 40 patients per pharmacy, and intraclass
833
834
835
836
837
838
839
840

841 correlation of 0.35 to account for the clustering of patients within pharmacy, a sample size of 1127 patients are
842 needed when using a two-side McNemar's Test.⁵¹ As the distress measure is based on a quantitative scale,
843
844 there should be more than ample power to detect changes with this outcome.
845
846
847

848 ***Data Collection Procedures***

849
850 Data collection procedures will mirror those described for Aim 2. Patients will be enrolled over a 1-month
851
852 timeframe and PROs collection/pharmacist intervention will occur monthly at subsequent pharmacy visits.
853
854

855 ***Analytic Procedures***

856
857
858 The general approach for visit-level PROs will be to fit generalized linear mixed multi-level models that include
859
860 both patient and pharmacy level factors. These models can flexibly fit various distributions of interest such as
861
862 binary for overall medication adherence and quantitative for total distress and medication complexity. Patient
863
864 visit will be the primary unit of analysis for most PROs, though medication-specific adherence will also be
865
866 explored when feasible. Time period (pre vs. post) intervention will be the primary explanatory variable of
867
868 interest to assess overall pre vs post differences. The pre-post evaluation of medication adherence uses
869
870 baseline (i.e., first time patient interacts with PatientToc™, before the pharmacist has used the data in
871
872 counseling) PROs data collection as the "pre" comparator. All subsequent PROs completions in PatientToc™
873
874 serve as the "post" data collection. Time from first intervention visit will also be considered to look for time
875
876 trends. Random effects for pharmacy and patient nested with pharmacy will be included. Covariates will
877
878 include: age, sex, race, number of regularly scheduled prescription medications, type of community pharmacy
879
880 (e.g., independent vs. chain), location of pharmacy (e.g., rural vs. urban), pharmacy prescription volume, and
881
882 state (Indiana, Minnesota, or Wisconsin.) For pharmacy level outcomes, all variables will first be aggregated to
883
884 the pharmacy level as needed via either means, medians, or proportions depending on the distribution of the
885
886 outcome. Next, paired t-tests or Wilcoxon signed-rank tests will be use to compare pre vs. post outcomes such
887
888 as proportion of prescriptions filled on time, prescription transfers, prescriptions filled, patient satisfaction, and
889
890 EQuiPP™ measures. Analytic procedures for qualitative data will occur as described in Aim 1 and analysis of
891
892 implementation outcomes will occur as described in Aim 2.
893
894

895 **DISCUSSION**

896

897
898 **Study Strengths**
899

900 This study has many strengths. The systematic collection of timely and actionable PROs data can be
901 challenging, particularly for patient populations with limited literacy and/or health literacy. For example, paper-
902 based data collection can be burdensome for data management/analysis and data quality concerns may be
903 evident.⁵² Electronic data collection offers advantages but technology must ensure privacy and security
904 standards are in place to support the reliability and validity of the data.⁵² In addition, data must be accessible to
905 providers in a timely fashion for clinical decision making.⁵³⁻⁵⁴ Technology exists to facilitate the transfer of
906 PROs data into electronic health records (EHRs) and providers want these data to populate with laboratory
907 results, but few electronic systems do so.⁵³ Prior studies have demonstrated that PROs data collected
908 electronically and on paper have similar psychometric estimates, and electronic collection is just as well-
909 received by patients.⁵⁴⁻⁵⁶ Furthermore, PatientToc™ is capable of, and has experience integrating, PROs data
910 from its system into EHRs, specifically populating in the laboratory results section of the record. This
911 experience will inform planned integration with pharmacy dispensing systems and EHR interfacing could be
912 explored for future information exchange between community pharmacists and physicians. Therefore, the
913 intervention being evaluated offers novel solutions to identified challenges with the collection of PROs across
914 diverse populations.
915
916
917
918
919
920
921
922
923
924
925
926
927
928
929
930

931 Moreover, a systematic review of implementation outcomes and evaluation strategies used in community
932 pharmacy services literature was recently completed.⁵⁷ This review of 237 articles meeting inclusion criteria
933 found very few reported data for penetration and sustainability (implementation outcomes being measured in
934 Aim 3); 1 and 12 articles respectively. Therefore, comprehensive evaluations, such as the study described
935 herein, of community pharmacy interventions guided by implementation science are greatly needed.
936
937
938
939
940
941
942
943
944

945 **Potential Challenges**
946

947 The EBQI process does not have a natural “timeline” for its work to be complete. The process can be lengthy
948 if the intervention and/or implementation strategies are complex. Further, disagreements sometimes occur in
949 the process of coming to consensus which can lengthen the process. While it is common for the EBQI process
950
951
952

953 to attempt to produce the same adapted intervention and implementation toolkit to be used at all participating
954 locations, it is possible for sites to employ “micro-tailoring” (i.e., site-specific plans tailored to the needs of the
955 site) within acceptable parameters (set by the group) to meet local needs. This tailoring can help to resolve
956 any differences that arise during the process to reach consensus. Curran et al. have used this process in
957 numerous research studies over the last 15 years and each time, the panels were able to reach consensus
958 (with minimal local micro-tailoring).^{23,58-59} However, the approach taken by each pharmacy to patient targeting
959 (i.e., only patients eligible for inclusion in this evaluation have the opportunity to complete PROs vs.
960 inclusion/exclusion criteria are applied after the pharmacy uses PatientToc™ as they see fit) may make
961 implementation more challenging as review of PROs data may or may not become a routine part of the
962 pharmacist’s workflow.
963
964
965
966
967
968
969
970
971
972
973

974 It is also recognized that challenges may arise regarding the technical needs pertaining to PatientToc™
975 implementation. Required data pulls and integration across PatientToc™ and pharmacy vendors may also be
976 challenging. However, active engagement by the PatientToc™ team and early conversations with dispensing
977 system vendors, coupled with funds budgeted toward IT support/data integration needs to assist with trouble-
978 shooting issues identified during the PDSA cycles lends confidence to the research team.

985

986 **Future Research**

987 This work will inform subsequent scaling and evaluation of PatientToc™ in community pharmacy practice.
988 Future research will focus on a) examining the effect of further scaling on PDP star measures pertaining to
989 medication adherence, b) integrating medication adherence PROs collected in PatientToc™ (and summaries
990 of pharmacist intervention) into patients’ EHRs, and c) linking PROs data collected across PBRNs with EHR
991 data for observational research. These efforts could be funded through future AHRQ awards (e.g., PA-14-291).
992 In the current evaluation, the study team is also considering sub-studies to examine the role of PatientToc™ in
993 capturing social determinants of health data in community pharmacies and in facilitating the collection of PROs
994 for use in specific patient care services (e.g., medication therapy management.)

1005 **Conclusion**

1006
1007
1008

1009 To the authors' knowledge, this research-in-progress is the first example of planned widespread electronic
1010 collection and use of PROs data in community pharmacy settings for the improvement of medication
1011 adherence. This research will inform long-term collection and use of PROs data pertaining to medication
1012 adherence in community pharmacies and has the potential to positively impact patient health outcomes as well
1013 as performance metrics of importance to community pharmacists and payers.

Figure 1. Study Overview and Role of Integrated Conceptual Frameworks

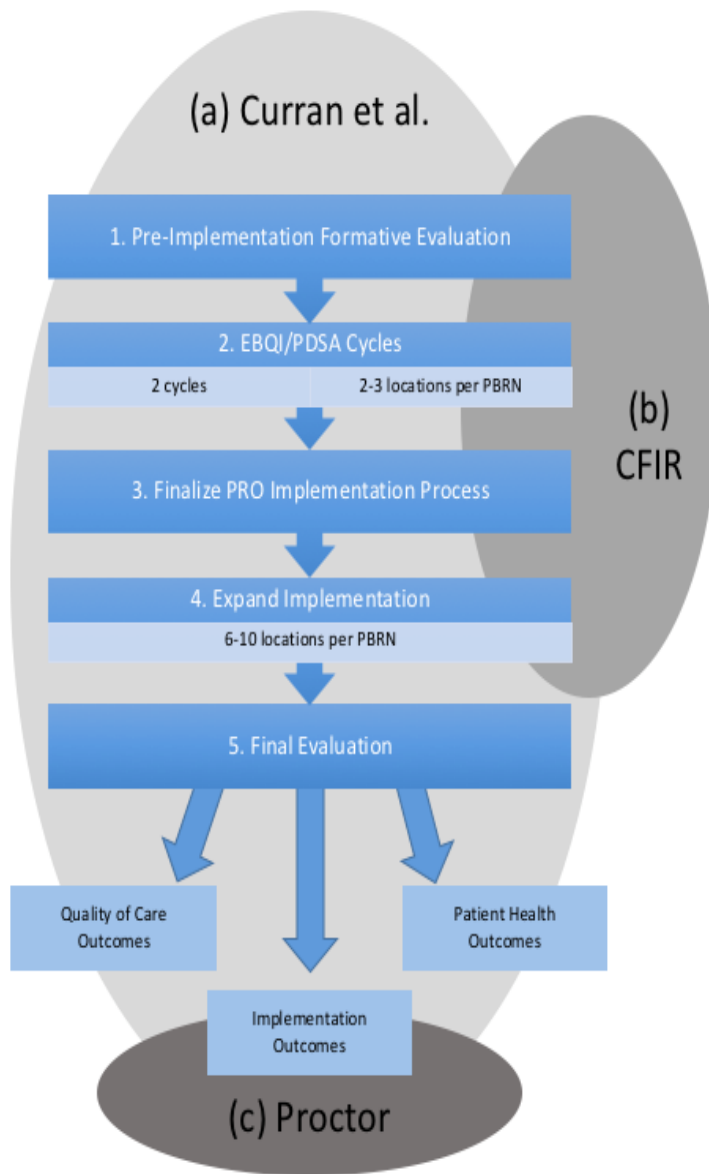

Figure 2. Screenshots of PatientToc™

Box 1. Example interview questions (for pharmacists), by CFIR domain

CFIR Domain	Example Questions
I. Intervention Characteristics	<p>For PatientToc™ to be implemented at your pharmacy, who would need to make the decision? What would you think about the possibility of implementation?</p> <p>How does PatientToc™ compare to other alternatives that may have been considered or used previously? What advantages does it have? Disadvantages? Are there other interventions you believe would be more beneficial? Why is that?</p> <p>What kind of changes or alterations to PatientToc™ would be needed to make it work in your pharmacy? Why is that?</p>
II. Outer Setting	<p>How do you think patients would respond to PatientToc? Any barriers to use? Examples? What alterations do you think would be needed made to meet specific needs/preferences?</p> <p>Can you tell me what you know about any other organizations that have implemented PatientToc or other similar programs? To what extent would implementing PatientToc provide an advantage for your organization compared to other organizations in your area? Examples?</p> <p>What kind of local, state, or national performance measures, policies, regulations, or guidelines might influence the decision to implement PatientToc? Why?</p>
III. Inner Setting	<p>How would the infrastructure of your organization (social architecture, age, maturity, size, or physical layout) affect the implementation of PatientToc? How would the infrastructure facilitate/hinder implementation? Examples? What kind of infrastructure changes would be needed? What would this process entail?</p> <p>What would you expect the general level of receptivity in your organization to implementing PatientToc? Why?</p> <p>How would you prioritize getting PatientToc implemented relative to other initiatives that are happening? Why is that?</p> <p>How does PatientToc align with goals of the pharmacy?</p> <p>What resources would be needed to successfully implement PatientToc?</p>
IV. Characteristics of Individuals	<p>How prepared do you feel to use PatientToc? Why?</p>
V. Process	<p>What plan would you suggest for implementing PatientToc?</p> <p>Who would be the key influential individuals to get on board with PatientToc?</p> <p>What steps would need to be taken to encourage individuals to commit to using PatientToc? Who would be the key individuals to engage? How does word get out to them?</p>

Box 2. Summary of Implementation, Quality of Care, and Patient Health Outcomes

Primary Outcomes		
Type	Outcome	Description of Planned Measurement Approach
Implementation	Acceptability	Perceptions among stakeholders regarding satisfaction with PatientToc™ implementation, as measured by qualitative themes identified through direct observation and interviews as well as descriptive statistics on refusal/completion data (patients declining participation, skipping items)
	Adoption	The initial decision to utilize PatientToc™ in pharmacy practice, as measured by qualitative themes identified through direct observation and interviews as well as descriptive statistics on patient utilization (number of patients consented, measures completed)
	Appropriateness	Perceived relevance and compatibility of PatientToc™ for community pharmacies, as measured by qualitative themes identified through direct observation and interviews.
	Costs	Descriptive statistics of costs of implementing PatientToc™ at participating pharmacies.
	Feasibility	The extent to which PatientToc™ can be successfully used in community pharmacies, as measured by qualitative themes identified through direct observation and interviews as well as descriptive statistics on the number of unscheduled contacts made with practices to discuss problems/issues.
	Fidelity	The degree to which PatientToc™ was implemented as intended, as measured by qualitative themes identified through direct observation and interviews as well as descriptive statistics on pharmacy adherence to PatientToc™ implementation as directed per implementation toolkit (e.g., number of days per PDSA when PatientToc™ was accessed; proportion of patients for whom PatientToc™ data was reviewed and used by the pharmacist during (as opposed to after) patient visit to pharmacy.)
Secondary Outcomes		
Quality of Care	Prescription wait times	Proportion of prescriptions filled within pharmacy's goal time for filling (when available)
	Prescription transfers	Monthly transfers in and out, per pharmacy
	Prescription volume	Number of prescriptions filled per month per pharmacy
	Patient satisfaction	Descriptive statistics of scores on patient satisfaction questionnaire (TBD)
Patient Health Outcomes	Medication adherence (PRO)	Self-reported, measured by scores on the Brief Medication Questionnaire (BMQ) regimen screen
	Medication adherence (PRO)	Self-reported, measured by scores on the Merck Medication Adherence Estimator (Adherence Estimator)
	Medication regimen complexity (PRO, automated)	Automatically computed score on Medication Regimen Complexity Index (MRCI)
	Side effect burden (PRO)	Self-reported, measured by scores on the Adverse Drug Reaction Event Side Effect Screener (ADDRESS)
	Pharmacy-level population medication adherence	Adherence measures from pharmacy-level EQUIPP™ data, when applicable
