Abstract

References to hours on Roman tombstones, long assumed to be a means of displaying affection for children, are shown to be the basis for horoscopes of the afterlife. Statistical analysis argues for the accuracy of the figures of hours recorded. Close study of the inscriptions demonstrates that all references, whether to points in time or durations are records of times of death. Such inscriptions were set up from the first-sixth centuries CE and were most prevalent in Rome, Italy, and North Africa. Among both pagans and Christians these times allow for the casting of horoscopes of the afterlife. The individual hours would have been associated with signs of the Zodiac, gods of the Pantheon, or the Apostles. The hours recorded also indicate the tutelar who would watch over the deceased in the afterlife. This practice develops in the late Republic as Rome encounters Hellenistic ideas of astrology and time measurement.

Keywords

Roman; inscriptions; epigraphy; Latin; epitaphs; hours; time measurement; death; astrology; horoscopes; Zodiac; Pantheon; Apostles; tutelars;

*... horologium in medio, ut quisquis horas inspiciet,
velit nolit, nomen meum legat.*

... [And put] a sundial in the center [of my tomb],
so that whoever should check the hour will read my
name – whether he likes it or not!

-Trimalchio (Petronius, *Satyricon* 71.11)

Acknowledgments

My thanks are due first and foremost to my thesis supervisor, Elizabeth M. Greene, who began advising me even before officially beginning her tenure here at The University of Western Ontario (UWO) and who has aided me immensely in lending my work focus, flow, and order. As well, I owe a debt of gratitude to Martin Beckmann, in whose Latin Epigraphy seminar in the fall semester of 2009 I first encountered epitaphs that recorded hours and who suggested that my seminar paper on the topic might merit further development in future. My thanks as well to the chair of my thesis committee, David Wilson, and to the members: Bernd Steinbock, Daniel Smith, and Les Murison. I am also grateful to Alexander Meyer and to Daniel Antchupalovski for advising me, respectively, on points of epigraphic and statistical import. In addition, I was fortunate to have numerous opportunities, at conferences or otherwise, to discuss aspects of my research with various scholars; in particular, I wish to thank John Bodel, Guy Chamberland, Christer Bruun, Jonathan Edmondson, Walter Scheidel, and Richard Talbert.

Portions of this research, especially of Chapter 1, have been presented at the UWO Classical Studies “Brown Bag” Lecture Series (April 2011); the Annual Meeting of the Classical Association of Canada (May 2011, Dalhousie University, Halifax); the Postgraduate Work-in-Progress Lecture Series at the Institute of Classical Studies, School of Advanced Study, University of London (November 2011); the Annual Meeting of the Archaeological Institute of America (January 2012, Philadelphia – awarded Best Poster). As well, a public lecture on the entire thesis was presented in March 2012 as part of the UWO Classical Studies Departmental Research Seminar.

I was able to conduct this research thanks to the support of a Canada Graduate Scholarship (Master's) from the Social Science and Humanities Research Council of Canada for the 2010-2011 academic year and an Ontario Graduate Scholarship for the 2011-2012 academic year, in addition to funding from the UWO Department of Classical Studies, the Faculty of Arts and Humanities, and the School of Graduate and Postdoctoral Studies. Furthermore, none of my conference travel would have been possible without the generous assistance of the Department of Classical Studies Discretionary Fund, the Western Graduate Thesis Research Fund, and the Office of the Dean of Arts and Humanities.

I wish to thank the faculty and staff of the Department of Classical Studies, firstly, for answering my myriad questions – whether technical, stylistic, methodological, or administrative – and for offering advice on all aspects of this work; moreover, for mentoring me these past six years and providing me with the training necessary to reach this stage of my academic career; and most crucially, for their patience and support. Likewise, I am thankful for the support of my peers, and for the advice offered by those among them who had written theses of their own, especially in regards to how I might approach such a task. Finally, I offer my thanks to my family for encouraging me, for trusting in me, and for allowing me to falter and start anew as I have progressed along the circumambulatory path that has brought me to this point.

Introduction

This thesis seeks to advance an interpretation of the motivations of Romans in recording *horae*, or hours, in epitaphs. The work grew out of a briefer study concerning issues of accuracy and precision in Roman epitaphs, with specific reference to those that record hours. The juxtaposition of demonstrably inaccurate or uncertain ages with precise figures of time is jarring, but even in cases where the ages appear accurate, the idea of recording such fine units of time seems to modern sensibilities to counter the somber tone expected in a funerary context. Hence, the practice seems to warrant outright dismissal, rather than studied consideration. Indeed, as the Literature Review will show, prior scholarship, while cognizant of these inscriptions, has all but written them off as a curiosity. Bearing all this in mind, the goal of the present investigation is to approach such epitaphs objectively in order to evaluate them on their merits.

The structure of this thesis is tripartite, each chapter advancing an argument that is to be taken up and expanded upon by the next. Chapter 1 explains the function of *horae* in sepulchral inscriptions; Chapter 2 accounts for their recording by pagans; Chapter 3 does likewise for Christians. The evidence of these chapters offers an overview of a practice from classical antiquity previously unidentified.

The first task of Chapter 1 is to establish a typology of inscriptions recording *horae*, from which analysis can proceed. Then, it addresses the issues of who set up these inscriptions, when they did so, and where these inscriptions come from. Much consideration is given to the matter of statistical anomalies, as these serve to explain whether the figures of hours recorded are accurate or conjectural or specifically chosen. Through selected case studies it is shown that *horae* are records of times of death.

Determining why pagan Romans would have recorded the hour of someone's death is the focus of Chapter 2. By way of addressing this problem, the chapter opens with an overview of time awareness in the late Republic and early Empire, so as to elucidate both the extent to which those recording would have been able to know the time, as well as to identify the contexts in which such data would have been pertinent, with an eye towards major lifecycle events. Cardinal among these is the use of the heavenly configuration at the hour of one's birth as the basis for one's horoscope. By casting death not as the termination of life, but as a rebirth into the afterlife the connotations of the *horae* recorded are transformed. The *horae* are then interpreted in light of astrological models related to time and birth.

Chapter 3 continues the analysis of Chapter 2, though the thread of discussion shifts both temporally and religiously, as the focus here is on Christian motivations for recording *horae*. The idea of syncretism is explored, with specific reference to Christian adoptions and adaptations of pre-existing systems of time indication. As systems of time and astrology were closely linked, the engagement of Christianity with astrology and the extent to which the two were integrated is discussed. Ultimately, the recording of *horae* in the Christian period is shown to be an extension of the practice that had developed in the pagan period, albeit with new Christianized meaning.

By bridging previously unlinked aspects of daily life in classical antiquity, the recording of *horae* in epitaphs is shown to be a product of concurrent developments in time awareness, astrological practice, and the epigraphic habit, functioning as the basis for horoscopes of the afterlife. While at first these have pagan associations, in time Christian tropes usurp these roles. Prior scholarship has neglected these inscriptions and

in so doing has failed to identify a longstanding and widespread commemorative practice.

A Note on Translations

All translations are by the author unless otherwise indicated.

A Note on the Maps

The maps (Figure 1 and Figure 2) are intended more as a general visualization than as a perfectly accurate representation of the inscriptions collected in the working corpus. Inscriptions of unknown or indeterminable provenance (accounting for approx. 5% of the total) have been dealt with in one of two ways: in those cases where a clustering presents itself in a province or region, these have been augmented; in cases where no such nucleation occurs, the additional inscriptions have been placed in the center of the province or region. As the provenances recorded in corpora of inscriptions may themselves be inaccurate, it is not possible to record all the inscriptions with absolute geographic accuracy. While recording the numbers of inscriptions in areas of nucleation, rather than representing each inscription with a dot would allow for greater geographic accuracy, the use of markers for individual inscriptions allows for a better visualization of quantities. As the concentration of inscriptions recording *horae* relative to all the inscriptions in a region is the more important metric than the raw numbers, the shading is the more crucial aspect of these maps, and hence its accuracy the more paramount concern.

Literature Review

References to *horae* in Roman epitaphs have received little attention in scholarship. Indeed, references to *horae* in any context have fared poorly in academic discourse. The last study to have given its full attention to them seems to have been Bilfinger's 1888 monograph *Die antiken Stundenangaben*. However, like many of his contemporaries in late 19th century Germany, Bilfinger is overly concerned with collecting and taxonomizing his evidence but gives little thought to understanding the motivations for recording such information.¹ Whereas Bilfinger seeks primarily to qualify the material, *i.e.*, to establish whether the Romans saw the hour as a point in time or a span of time, the present goal will be to determine why people would choose to record such information at all.

Despite being noted by scholars briefly in overviews of *tituli sacri*, references to *horae* are generally dismissed as mere curiosities and mentioned only in passing. Armini notes that in his sample of 14,500 lifespans from the epitaphs of Italy, approximately 2,000 (12%) feature months as their most precise unit of time, approximately 5,000 (33%) feature days in this role, and over 200 (2%) feature hours.² More so than Bilfinger, however, Armini is content to tabulate without inquiry into the basis for this practice. Sandys notes, in the midst of a discussion of the grammatical cases used for units of time, that "... the number of years may be followed by that of the months, days, and even

¹ That said, Dohrn-van Rossum (1996:11), in reference to another work of Bilfinger's, praises his efforts to account for the social context of his material, rather than taking a strictly positivist approach to the material.

² Armini (1916:5).

hours”.³ This marks both the start and the end of his discussion of *horae*. Slightly more in-depth is Calabi Limentani-Degrassi, offering again that figures of years in durations of life can be followed by figures of months, days, and hours.⁴ Further, that there is a tendency to record primarily the lifespans of those who were young or dear – a common misconception, as the present data shows (*cf.* Figure 4) – and that such commemoration is more common in late antiquity and among Christians. While there is no explicit reason given for the inclusion of hours, an attempt is made to situate it within the context of prevailing commemorative practices. Almar analyzes an inscription (CIL 06, 18817) which gives a rough time of death, but he gives no thought to this detail in his commentary, simply noting that the deceased passed at night.⁵

In transcriptions of Latin inscriptions *horae* fare no better, often being accompanied by exclamation points, showing disbelief or doubt on the part of the epigrapher. Somewhat more consideration seems to be given to them when considering Greek practices of age recording. Kajanto, in discussing Latin influences apparent in the Greek epitaphs of the city of Rome, highlights precision as a characteristically Latin quality, citing that Greek epitaphs generally include only years, while Latin epitaphs can go so far as including hours.⁶ Ultimately, he concludes that this was a Roman practice.⁷ This sentiment is shared by Rutgers who arrives at a similar conclusion from his analysis

³ Sandys (1919:63).

⁴ Calabi Limentani-Degrassi (1968:200).

⁵ Almar (1990:114).

⁶ Kajanto (1963a:13).

⁷ Kajanto (1963a:44).

of Jewish epitaphs from the city of Rome.⁸ McLean, in his guide to Greek epigraphy in the Hellenistic and Roman periods, acknowledges the inclusion of figures of hours in epitaphs, but does so solely in reference to commemorations of children.⁹ This, as will be shown, was most certainly not the case (*cf.* Figure 4).

Their prevalence in the archaeological record, however, attests to the fact that their inclusion was an accepted practice. Szilágyi studied approximately 43,000 epitaphs recording durations of life, the most comprehensive analysis of such material to date – figures of years, however, were his sole concern.¹⁰ The present sample comprises approximately 2% as many inscriptions as Szilágyi's corpus, a not inconsiderable number. As such, these inscriptions are long overdue for scholarly analysis and this work is intended to shed light on a previously overlooked, yet widespread commemorative practice from classical antiquity.

In determining the motivations for the erection of these epitaphs, the work of several scholars will be instrumental in describing tropes of Roman daily life. In particular, Feeny on Roman conceptions of time, Beck on astrological theory, Hegedus on Christianity and astrology, and Danéliou on the apostles and the Zodiac will feature prominently in the analysis.¹¹ While the interpretations advanced will by necessity have a grounding in the work of other scholars and in the evidence from antiquity, the models and principles discussed have never been associated with the funerary recording of hours.

Chapter 1: Tombstones that Record Hours

Introduction

There exists a class of Roman funerary inscriptions in which mention is made of hours, or *horae*. These references appear primarily in the form of an order of magnitude in the progression of units quantifying durations of life, but they are not limited to this usage. This first chapter represents a comprehensive effort to collect, classify, and account for all instances of this epigraphic practice; to trace its geographic and temporal distribution; to analyze the dataset of inscriptions for statistical patterns and anomalies; and to determine the function that such references serve.

At conflict here are the qualitative and quantitative aspects of the data presented in these inscriptions. While recording quantities such as hours adds greater precision to ages or an individual's time of death, somewhat perplexingly, this increase in precision is not necessarily reciprocated by a corresponding increase in accuracy. The issue of why such information would be recorded, if not for its accuracy, is an important one, and alternate motivations for including such information will be considered. The second and third chapters will situate these inscriptions in a broader context, commenting upon Roman methods of measuring and recording time and the awareness by the populace of the time of day on a daily basis, and, ultimately, providing the reasons for recording hours, with specific attention given to the differing motivations of pagans and Christians.

Scope, Methodology, and Limitations

The scope of this study is intended to encompass all Latin funerary inscriptions that make reference to *horae*, regardless of the contexts of these references within the

inscriptions. Notably, this overlooks a substantial portion of surviving Roman inscriptions, namely, those in Greek.¹² The practice of recording ages had its origins at Rome but was later adopted by those who came under the influence of the expanding empire.¹³ The most basic way to account for the appearance of this practice in Greek epitaphs is to view it as an adoption of a Latin custom by Greek-speakers.¹⁴ Yet, Kajanto suggests that Latin speakers, or, at the very least, those who were bilingual, may have chosen to set their epitaphs in Greek to lend them an aura of prestige.¹⁵

¹² Consulting the Packard Humanities Institute's database of Greek inscriptions yielded twenty-eight funerary inscriptions featuring durations with ὥραι. As this database is by no means a comprehensive collection of all published Greek inscriptions and as it displays a heavy bias towards the inscriptions of Classical Greece, there are doubtless many more Greek inscriptions of this type to be amassed. The twenty-eight collected thus far are: IEph 1636; IEph 2268; ILipara 498; IG XIV 2252; IG XIV 2308; IGUR II 1004; IGUR II 1023; IGUR II 1084; IGUR II 1090; IGUR II 389; IGUR II 436; IGUR II 703; IGUR II 727; IGUR II 799; IGUR II 890; IGUR II 903; IGUR II 993; IGUR III 1355; JIWE 1 12; SEG 18:402; SEG 20:548; SEG 28:1395; SEG 34:1469; SEG 7:365; SEG 7:368; SEG 9:877; SGLIBulg 108. Further study of these Greek inscriptions is warranted, but it is outside the scope of the present study.

¹³ Rutgers (1995:101-107) presents examples of how Jews both adopted this practice in the city of Rome and took it back East. He also cites the fact that the practice does not appear in the Punic epigraphic record until after the Romans take control of Carthage. Nor is he the only one to ascribe a distinct Roman quality to the practice, as Kajanto (1963a) also presents this view.

¹⁴ This accounts for the fact that the Greek examples all come from the Eastern half of the empire and the city of Rome, while the prevalence of Latin examples in the Eastern empire is much diminished relative to the West. Éry (1969:60) gives figures of 9,980 Latin epitaphs from Rome recording ages vs. only 822 Greek examples. This figure considered in tandem with the numbers of Latin and Greek epitaphs that record hours show that age recording did not achieve the same prominence among Greek speakers that it held among Latin speakers.

Kajanto (1963a:12-13) gives figures for the number of Greek inscriptions that record ages. While the percentage is quite high in the city of Rome – in fact the figure of 42% exceeds the 38% of Latin epitaphs from Rome – the figures drop markedly in the Eastern provinces, with the exception of Egypt which had an independent tradition of age recording.

As for those few instances where Greek speakers did adopt the Latin custom, Galvao-Sobrinho (1995:451-452) identifies the desire to look Roman as a driving force in epigraphic practice during the Principate. Thus, it is possible that Greek speakers, feeling a disconnect from the prevailing culture and wishing to appear more staunchly Roman, may have borrowed the practice.

¹⁵ Kajanto (1963a:6) cites the long-standing Greek epigraphic tradition as well as the fact that those commemorating in Greek seem to have been of a higher social status. It can be noted – not without some irony – that both Latin (*cf.* n.14) and Greek were used for reasons of appearances.

All of the Latin inscriptions studied were drawn from the remarkably thorough Epigraphik-Datenbank Clauss-Slaby (EDCS).¹⁶ The inscriptions were returned by the database on the basis of two searches for the strings *hora* and *horis*.¹⁷ Misspellings were accounted for;¹⁸ unexpanded abbreviations were not.¹⁹ The searches yielded 903 unique epitaphs with references to hours.²⁰ Those five inscriptions that have been identified as forgeries have been removed from the dataset (*cf.* Appendix I), yielding a final count of 898. The readings of the inscriptions herein are as returned by the EDCS, albeit with some minor editorial modifications; there can at times be disagreement with the printed volumes of the corpora from which they are drawn.²¹

¹⁶ As of Dec 1, 2011, the EDCS has been populated with the transcriptions of 415,204 inscriptions drawn from in excess of 1,230 volumes – a not inconsiderable corpus from which to work. Other, less comprehensive databases were also consulted in the hopes of finding additional inscriptions that the EDCS might have missed, but to no avail.

¹⁷ The former search, performed on August 3, 2011, returned 1,106 results, of which 582 were determined to be epitaphs referencing hours. The remainder consisted of numerous tombstones belonging to men named *Horatius* and women named *Horatia*, as well as those belonging to men who had held the position of *choragus*; plentiful references to *amphorae*; various other less-common words containing the string *hora*; and non-funerary inscriptions referencing hours. *Cf.* n.22.

The second search, performed on August 8, 2011, returned 428 results, of which 327 were grave markers of the types desired. This search added references to hours made using the dative and ablative plural forms *horis* to the collection of inscriptions featuring the forms *hora*, *horae*, *horam*, *horarum*, and *horas*, as provided by the earlier search.

¹⁸ The database automatically returned misspellings, such as *ora* for *hora*.

¹⁹ *E.g.* instances where an ‘h’ (for *hora*, *horae*, etc.) or an ‘o’ (for *ora*, *orae*, etc.) was left unexpanded – possibly coming in sequence after quantities of *annos*, *menses*, and *dies* that had eroded away or been broken off. Trawling through the many hundreds of thousands of published Latin inscriptions in search of an errant ‘h’ or ‘o’ was simply not a feasible undertaking given the timeline of this project.

²⁰ Although 909 records in total were determined to be epitaphs, six were identified as duplicates of other records.

²¹ *Cf.* Appendix VI and Appendix VII for a full listing of all inscriptions consulted and the corpora in which they are published.

The Working Corpus

The total number of inscriptions includes both those that are statistically useful and those which are not. This latter category can be subdivided into those inscriptions that are fragmentary and those that are unclassifiable and may, in certain cases, have been spuriously interpreted as references to *horae* or been designated as grave markers on only the most tenuous of bases. Nevertheless, these problematic inscriptions are of use insofar as they can give a broader impression of the prevalence of the practice of recording *horae* and its geographic distribution. They will, however, be omitted from some of the analyses to follow, for in certain cases, while the category of inscription is discernible, the fragmentary nature of the inscription may preclude further investigation; for, *e.g.* an indicator of unit, such as hours, may be present, but the corresponding quantity lost. There are fifty-nine of these unclassifiable or otherwise unusable inscriptions, thereby limiting the size of the working corpus to 839.

Similarly, the working dataset will also be affected by inscriptions which fall into multiple categories, such as those giving a duration in terms of hours as well as the specific time of an event, or, say, listing two durations in terms of hours. Although there are 898 inscriptions, they record 945 references to *horae*.

Typology

The inscriptions have been divided into three main categories, according to the way in which *horae* are referenced. Those that use *horae* in a literary manner form the first class; those that use *horae* in measures of durations form the second; and those that

employ *horae* to indicate specific points in time from the third.²²

Literary and Poetic Uses

The first category comprises all linguistic usages with no numerical significance. Generally, these are references to the hour of someone's death; the precise moment in time need not be indicated. Fifty-four inscriptions fall into this category.

Four inscriptions form a subset of this category. These provide an indication of the use of formulaic phrasing in reference to the hour of death. The first indicates that the times of birth and death would have been the same.

CIL 06, 06423 – Rome

OSSA SITA SUNT CLEMENT(IS) | HILARIONIS FILI(I) NATO | ATHENAINE VIXIT ANNOS | III
MENSES VII QUEI | SPIRITUM EXSOLVIT | HORA QUA NATUS EST

*The bones of Clemens, son of Hilario, lie here. Born at Athens, he, **who released his breath at the same hour at which he was born**, lived three years, seven months.*

That this information was inscribed attests to the fact that some importance was attached to this coincidence.²³ Yet, stronger relations also merit mention:

²² A fourth minor class could be said to include all those inscriptions from non-funerary contexts that refer to *horae*. Though such inscriptions are not included in the figures herein, sepulchral inscriptions recording *horae* outnumber non-sepulchral examples in the epigraphic record by a ratio of about 9:1. These too, for the most part, adhere to a simple taxonomy. Most common are those inscriptions that record the times at which travelling venerator of the Colossi of Memnon (statues of Amenhotep III) at Thebes heard the divine presence (*cf.* Bernand-Bernand 1960). Inscriptions of this type, however, are peculiar to the one site. The most widespread type are those inscriptions that would have accompanied *horologia*. These inscriptions feature ranges of hours and the corresponding lengths that the gnomon's shadow would have had at those times. These measurements are calibrated by month and a full year's worth of readings are often listed. The other relatively common non-funerary context for references to *horae* are decrees and announcements. Laws can feature information as to tasks that must be carried out at certain hours, and announcements that contain, *e.g.*, information on when gladiatorial games are to be held. All of these categories are paralleled in the Greek epigraphic record of the Roman Empire.

²³ Though such occurrences were not always explicitly remarked upon:

CIL 06, 28044 (p 3535, 3918) = CLE 01575 = D 08191 – Rome

ICUR-07, 19181b – Rome

PETRONIUS QUI <v=B>IXIT ANNIS IIII | M(ENSIBUS) III D(IEBUS) XXVI | **DECESSIT V IDUS IUL(IAS) | EADEM DIE ET (H)ORA | QUA NATUS EST**

Petronius who lived four years, three months, twenty-six days, died on the fifth day before the Ides of July – the same day and hour at which he was born.

It is not simply the hour of birth and death that are the same, but the day as well. In this case, owing to the three months and twenty-four days in the lifespan, *die* likely refers to the day of the week on which Petronius was born, rather than to the date of birth itself.

This assumption is supported by this more explicit reference:

CIL 06, 06182 (p 3419, 3851) = CLE 01150 = D 07589 – Rome

D(IS) M(ANIBUS) | C(AIO) VETTIO CAPITOLINO FILIO PIENTIS|SIMO PLOTIA CAPITOLINA MATER IN|FELICISSIMA FECIT VIX(IT) ANNIS XIII | **QUI DIE NATALI SUO HORA QUA NATUS | EST OBIIT ...**

To the spirits of the departed: Plotia Capitolina, a most unfortunate mother, made this for Gaius Vettius Capitolinus, a most dutiful son. He lived thirteen years – [he,] who died on his birthday at the hour at which he was born. ...

This tombstone records a rare event. The odds that someone would die on the same day of the week they were born are 1 in 7 and the odds that they would die at the hour of their birth are 1 in 24; the odds of both these event happening is 1 in 168. The odds of dying on one's birthday are approximately 1 in 365 and doing so at the hour of one's birth are approximately 1 in 8760. Given those odds, to have more than one inscription that records someone dying on their birthday in a corpus of this size would seem statistically

...| DIS MANIBUS | SACRUM | L(UCIO) VALERIO INFANTI | RAPTUS QUI EST SUBITO | QUO FATO NON SCITUR | **NATUS NOCTIS H(ORA) VI | VIXIT DIEBUS LXXI | ABI(I)T NOCTIS {AB} H(ORA) VI | ...**

... Sacred to the spirits of the departed: To the newborn Lucius Valerius, who was taken suddenly – by what fate it is not known – born at the sixth hour of the night, he lived seventy-one days and departed at the sixth hour of the night. ...

aberrant. Yet, these few inscriptions show that this was seen as a significant occurrence, which may indicate that it was singled out for commemoration, as it demonstrated a continuity between the moment of birth and the moment of death.²⁴ The next example gives a sense of how these formulaic inscriptions relate to the numeric inscriptions to be discussed shortly:

CLE 02177 = AE 1920, 00083 – Rome

DIS MANIBUS C(AI) ATTI C(AI) L(IBERTI) MATURI NOMINE ERAM | MATURUS NON AETATE
FUTURUS ANNOS VIXI XVI ET | MENSES VIII TOTIDEMQUE DIEBUS ET HORIS OCTAVA FUI |
NATUS NOCTIS EGO HORA IDEM OCTAVA FATIS RED|DIDI ...

To the spirits of the departed: By the name Gaius Attius Maturus, freedman of Gaius, I was of age – not going to be old. I lived sixteen years, nine months and the same number of days and eight hours. I was born at the same hour of the night I returned to the Fates....

This is likely the most creative inscription in the lot, taking the form of a poetic account by Caius Attus Maturus, the deceased, of his life and what he left behind. He gives his lifespan as *annos vixi XVI et menses VIII totidemque diebus et horis octava*, or sixteen years, nine months, nine days, and eight hours. He then states that he was born at the very same eighth hour of the night that he had returned to the Fates (*fui natus noctis ego hora idem octava fatis reddidi*). Note that the figure of eight hours in his lifespan serves not simply as a figure in this duration, but that it also serves a secondary role indicating the hour of his death. This is a crucial point, for it sets a precedent for the way in which hours listed in durations can be interpreted in other inscriptions.

While there are only a few inscriptions that explicitly note birth and death having occurred at the same hour, the fact that there is a pattern is an argument in defense of the

²⁴ Chapter 2 will deal with the connection between these terminal points of one's life.

use of formulaic language. Albeit with slight variations, the general formula is the phrase *hora qua natus est* following a verb of dying. This demonstrates that significance was attached to noting the hour of death.²⁵

Durations

Reckonings of durations are by far the most common context in which *horae* appear in sepulchral inscriptions. They take the form of iterations of units, progressing from longest to shortest. When the value of a unit is zero, it is omitted. The standard progression will move from years to months to days to hours. Exceptions do arise and other units are sometimes employed.²⁶

There are 742 durations that clearly include hours coming from 729 inscriptions. Their distribution is as follows: seven-hundred and sixteen lifespans, *e.g.*:

CIL 08, 27090a – Africa proconsularis (Dougga / Thugga)

D(IS) M(ANIBUS) S(ACRUM) | NICETA | V(IXIT) A(NNUM) M(ENSEM) H(ORAM)

*Sacred to the spirits of the departed: Niceta lived a year, a month, **an hour**.*

Twenty-three lengths of marriages, *e.g.*:

CIL 11, 01458 – Etruria / Regio VII (Pisa / Pisae)

D(IS) M(ANIBUS) | AUFIDIAE VICTORIAE | CONIUGI BENE MER(ENTI) | FECIT | P(UBLIUS) VETURIUS | MARTIALIS | CUM QUA VIX(IT) | ANNIS XXV | MENSIB(US) X DIEB(US) XV | HORIS VII | S(INE) Q(UERELLA) U(LLA)

*To the spirits of the departed: Publius Veturius Martial made this for Aufidia Victoria, his well-deserving wife, **with whom he lived twenty-five years, ten months, fifteen days, seven hours**, without any complaint.*

²⁵ This will be important in Chapter 2.

²⁶ Cf. “Finer Units Than Hours” p.47.

Three measures of how long one person outlived another, *e.g.*:

CIL 08, 27884 – Africa proconsularis (Tebessa / Theveste)

D(IS) M(ANIBUS) S(ACRUM) | C(AIUS) IULIUS FORT|UNATIANUS | V(IXIT) A(NNOS) XVII
D(IES) XXV | HO(RAS) VIII POST FAB|IA(M) FORTUNATA(M) | MATRE(M) PIA(M) S(UAM)
V(IXIT) A(NNOS) | III M(ENSES) VI D(IES) XXI (H)O(RAM) | H(IC) S(ITUS) E(ST)

Sacred to the spirits of the departed: Gaius Julius Fortunatianus lived seventeen years, twenty-five days, eight hours. He lived three years, six months, twenty-one days, one hour after his reverent mother, Fabia Fortunata, [passed]. Here he lies

And one length of military service.²⁷

Points in Time

A total of seventy-four points in time are recorded in sixty-three epitaphs. Most common are times of death, appearing on forty-seven grave markers, *e.g.*:

ICUR-04, 12762 – Rome

FRATRI SEVERIA|NO BENE MEREN(TI) | QUI <v=B>IXIT ANNOS | XXXX DECESSIT V
KAL(ENDAS) | SEPTE<M=N>BRES (H)ORA V

To [my] well-deserving brother Severianus, who lived forty years. He died the fifth day before the Kalends of September at the fifth hour.

Eleven are times of birth, *e.g.*:

ILCV 04396 – Rome

VII KAL(ENDAS) | AUG(USTAS) NATUS | DIE IOVIS | (H)ORA XII || HERCULIO MERENTI | III
NONAS OCTOB(RES)

To deserving Herculus, born the seventh day before the Kalends of August, the day of Jupiter, at the twelfth hour, [he died] the third day before the Nones of October.

And seven record other events, such as burials, *e.g.*:

CIL 06, 13782 – Rome

L(UCIUS) CAECILIUS L(UCI) L(IBERTUS) SYRUS | NATUS MENSE MAIO | HORA NOCTIS VI |
DIE MERCURI | VIXIT ANN(OS) VI DIES XXXXIII | MORTUUS EST IIII K(ALENDAS) IULIAS |

²⁷ CIL 05, 00914.; *cf.* p. 54.

HORA X | ELATUS EST H(ORAS) III FREQUENTIA MAXIMA

Lucius Caecilius Syrus, freedman of Lucius, born in the month of May, at the sixth hour of the night, on the day of Mercury, he lived six years, forty-three days. He died the fourth day before the Kalends of July at the tenth hour. He was borne out at the third hour by a great crowd.

Sometimes these references mention hours of the night, as in the previous inscription or hours of the day, as in the following:²⁸

AE 1991, 00680 – Etruria / Regio VII (Tolfa)

DOMIN(A)E FILI(A)E | VICTORIN(A)E IN|NOCENTISSIM(A)E | QU(A)E VIX(IT) AN(NUM)
UNU(M) | MENSES QUIN(QUE) D(IES) N(UMERO) XV | RED(DIDIT) PR(IDIE) NO(NAS)
IAN(UARIAS) (H)OR(A) D(IEI) IIII | IN PACE

To Domina, daughter of Victorina, a most blameless girl, who lived one year, five months, fifteen days. She returned [to the earth] the day before the Nones of January at the fourth hour of the day. [May she lie] in peace.

A distinction must be drawn between *horae diei*, hours of the day, and *horae*

²⁸ There is also one reference to an hour of the afternoon:

CIL 08, 20819 – Mauretania Caesariensis (Mta Djafar, Koudiat)

[ZDP[...] | [...]ST SUMMA | [...] A(NNUM) I M(ENSES) VIII D(IES) | [...] NAT(US) FU(I)T
S(I)GNO | [...] H]OR(I)S POMER(IDANIS) UT VBIF | [...]E]RAT IB(I) NAT(US) [...] DB[...] | D
P(IA) V(IXIT) A(NNOS) XXV M(ENSES) IIII

... ZPD ... ST greatest ... one year, eight months, ... days ... was born [under] the sign ... hours of the afternoon that VBIF ... was born there ... DB ... D ...reverent, she lived twenty-five years, four months.

As well, there is one admittedly speculative reference to an hour of the evening:

CIL 04, 00294 – Latium et Campania / Regio I (Pompei)

IU(V)ENILLA || NATA | DIE SATU(RNI) (H)ORA SECU(NDA) V(ESPERTINA) | IIII NON(AS)
AU(GUSTAS)

Juvenilla, born on the day of Saturn, at the second hour of the evening, on the fourth day before the Nones of August.

In this case, it might be best to heed Bodel's warning that editors who "... wishing to make sense of an incomplete text ... propose supplements (often avowedly by *exempli gratia*) that are, at best, merely possible and, at worst, no more than wishful thinking" (2001:52). Perhaps the *V* in *vespertina* is actually part of the *N* from *secunda*. As Chapter 2 will demonstrate, the combination of a reference to the second hour and a reference to the evening is illogical.

noctis, hours of the night. The former could easily have been measured by means of a sundial; anyone stubbornly trying to measure the latter in the same manner would run into difficulty – some alternate means would have been needed to measure nocturnal hours. As the length of the daytime hours increased from the winter to the summer solstice, the nighttime hours would decrease at a corresponding rate. Likewise, as the former decreased from the summer solstice back to the winter solstice, the latter would increase at a corresponding rate. Only at the vernal and autumnal equinoxes would the days and nights feature hours of uniform length. The simplest tool to measure the hours of the night would be a water clock, but care would have to be taken to ensure that it was properly calibrated for hours of the correct length each night.

This is all well and good for separate systems of measurement during sunlight and moonlight, but this method falters when time is reckoned according to the nychthemeron, such as in our modern 24-hour system. A nychthemeron dispenses with separate diurnal and nocturnal cycles and works on a circadian cycle based on the principle of a unit of fixed length. Some points become arbitrary – thus noon is no longer high noon with the sun at its zenith, nor midnight the midpoint between sunrise and sunset – but standardization creates normalcies of a different sort. References to deaths at the 13th through 24th hours hint at the use of a nychthemeral system.

Grammatical Cases

Distinction must be made when studying these inscriptions between the different syntactical ways of expressing time in Latin. The accusative may be used to express durations of time; the ablative may be used to express either specific points in time (time

when) or ranges of time (time within which). Sandys notes that *annis* is often found in epitaphs followed by an ungrammatical *menses* or *dies*.²⁹ Based on the data from the present collection, *horas* can be added to that list.

Conversely, inscriptions will shift oftentimes from the accusative for figures of years, months, and days to the ablative for figures of hours.³⁰ In these cases the four terms are written in succession without interruption by other qualifiers, such as participles like *defunctus*, which would indicate that a shift is being made from the duration to a record of a point in time. It is incumbent upon the reader to recognize that this qualitative change in the nature of the information inscribed has occurred. These figures in the ablative could very well serve a dual purpose, being references to the time of death on the basis of their case and parts of the durations on grounds of proximity to the other figures within the inscriptions.

Geographic Distribution

The inscriptions come from twenty-two different regions of the Roman Empire (*cf.* Figure 1 and Figure 2). There is a strong bias towards the Western provinces, likely because Greek was the *lingua franca* in the East. The distribution by province can be seen in Appendix II.³¹ The main pattern of the distribution is as follows: a concentrated center

²⁹ Sandys (1919) 63.

³⁰ Nordberg (1963) gives a very thorough and technical analysis of grammatical cases used to express durations of time in epitaphs.

³¹ The distribution of Greek inscriptions is as follows: Rome: 13, Italy: 3, Sicily: 2, Moesia Inferior: 2, Numidia: 1, Egypt: 1, Asia: 2, Mesopotamia: 2, Palestina: 2. Compared to the Latin dataset, this demonstrates a marked increase in the number of inscriptions coming from the Eastern half of the empire.

Figure 1 –Distribution of the Dataset in the Roman Empire (excluding Italy)

Figure 2 – Distribution of the Dataset in Italy

at the city of Rome; a very high density along the Tyrrhenian coast from Rome down to the Bay of Naples; greater diffusion throughout the rest of Italy; pockets of high concentration starting at the Eastern end of the Atlas Mountains in North Africa near Carthage and moving west along the Mediterranean coast, keeping north of the Sahara; elsewhere a very scattered and sparse distribution.

However, it is not enough simply to compare the tally of inscriptions from one province to the tally of inscriptions from another. Owing to differing rates of inscription survival, it pays to consider how common epitaphs recording *horae* are relative to all the documented inscriptions from a certain province (*cf.* Appendix II).

By this means of measurement, inscriptions recording *horae* are most common in the archaeological records of the city of Rome, and the provinces of Africa Proconsularis and Mauretania Caesariensis, comprising just below 0.5% of total documented inscriptions in each case. The Tyrrhenian side of Italy ranks next with figures nearer 0.25%, as opposed to figures hovering around 0.1% on the Adriatic side of Italy. Figures in the European provinces are closer to 0.03%. Thus, western Italy and North-Western Africa remain the areas of greatest prevalence, and the high proportion of the sample coming from Rome is brought into perspective, its prominence diminished relative to the hundred-thousand-plus known inscriptions from the city.

The 898 inscriptions with known provenances come from 183 sites within the twenty-two regions, with six inscriptions coming from unknown locations (*cf.* Appendix III).³² Of these sites, 139 have but one inscription each. Ninety-eight come from sites

³² Four inscriptions are of known province but unknown city; two are of unknown province. Keppie (1991:37) cautions that inscriptions' provenances can at times refer not to the original location but to the

with two to six inscriptions. The remainder come from seven sites: Aquileia in Italy and Tapaura in Africa Proconsularis with nine each, Puteoli in Italy and Carthage in Africa Proconsularis with fifteen each, Ostia Antica with forty-two, Mactaris in Africa Proconsularis with fifty-five, and Rome with 510.

For the most part, the geographic distribution of the dataset reflects the general distribution of inscriptions in the archaeological record. In Italy, Campania has traditionally yielded the most epigraphic material and Lucania the least; in Africa, the scale runs from Africa Proconsularis down to Mauritania Tingitana; in parts of Europe (*e.g.* Aquitania, Lugdunensis, and Belgica) the practice of setting up inscriptions does not seem to have enjoyed the same popularity as elsewhere.³³ Urban and military contexts have historically yielded the highest densities of inscriptions, followed by features such as crossroads or river valleys.³⁴ The areas of highest concentration in the dataset are urban,³⁵ though among the sparser areas contexts along the frontiers of the empire are common, suggesting connections to the military. Ultimately, the provincial concentrations are likely more accurate than the urban distribution,³⁶ for provenances

nearest modern community or to the location of the institution at which the stone was catalogued.

³³ Bodel (2001:8).

³⁴ Bodel (2001:9). Galvao-Sobrinho (1995:445) also notes the way in which military outposts aid in the spread of epigraphic practices.

³⁵ Bodel (2001:14) writes: “Sometimes the epigraphic profile of an otherwise ordinary community is inexplicably prominent.” In the case of a city such as Mactar, which accounts for 6% of the dataset, this overrepresentation is in part to be attributed to the extent of archaeological work conducted at the site. It is also possible that the rate of inscription survival in a large city was so poor as to yield a lower number of stones in the archaeological record than a much smaller settlement (Duncan-Jones 1982:360).

³⁶ Duncan-Jones (1982:361) echoes this sentiment.

recorded in corpora such as the CIL can often be guesses rather than firm assertions.³⁷

The Epigraphic Habit, Epigraphic Bias, and Inscription Survival

Bodel defines epigraphic bias as “... the distortion introduced into any set of data derived from inscriptions by the fact that inscriptions are the source of the information in question”.³⁸ He continues: “The selection of what to inscribe and in what form to write it was never determined solely by what one wished to communicate or to record but by what was considered appropriate to communicate or to record in inscribed writing on a particular object in a particular place at a particular time.”³⁹ Thus, to a certain extent, the epigraphic record shows that practice was prevalent in certain regions because it was a prevalent epigraphic practice in those regions. Those setting up these inscriptions were not part of a representative sample of the Roman population; rather, they were a select group adhering to certain commemorative practices.⁴⁰

Also influencing the distribution of the dataset is the rate of inscription survival.

³⁷ Keppie (1991:37) notes that in the CIL in particular the cities given for find-spots could be the homes of collections housing the inscriptions in questions, or reasonable guesses as to provenances, or even rough approximations if stones were found near to major sites.

³⁸ Bodel (2001:34).

³⁹ *Ibid.*

⁴⁰ Hopkins (1987:113-115) notes that such a bias is created by the group of those Romans who set up tombstones and that it cannot be corrected to provide an accurate demographic picture, for there is no information on those not represented. Bodel (2001:36; 46) advises being mindful of the distinction between those who commemorated and the full demographic structure of Roman society. Further, that cultural motivations should be considered alongside the more commonly cited geographic and temporal factors in discussing commemorative practice. Duncan-Jones (1977:342) presents the view that as nearly all African epitaphs record ages, they provide a good basis for a model of the ages of those able to afford tombstones. Keppie (1991:105) points out that the poor would have resorted to wooden grave markers with painted inscriptions. Salmon (1987:1-2) calculates that the starting cost for an inscription would have been equivalent to the amount earned from three months’ unskilled labor.

For the entire Roman Empire, fewer than one thousand inscriptions per annum have survived⁴¹ – a small fraction of what there once was.⁴² Though epitaphs account for approximately two-thirds of all surviving inscriptions,⁴³ as a group their ranks have been much thinned over the centuries.⁴⁴ The current state of the epigraphic record is also dependent on factors such as the durability of the stone used, the extent of reoccupation on a site, the extent of excavation conducted at a site and, for present purposes, whether the necropolis has been excavated.⁴⁵

The general pattern of epigraphic production in antiquity gives evidence for a steadily rising number of inscriptions set up in the first and second centuries CE, the majority of which were epitaphs; a decline in the third century; an epigraphic revival from the mid-fourth century until the sixth or seventh, with epitaphs accounting for almost all inscriptions from this final period.⁴⁶ During the Republican period Roman inscriptions were to be found primarily at Rome; it was not until Augustus that the

⁴¹ Keppie (1991:9).

⁴² Keppie (1991:34) gives 5% as being most likely an above-average rate of survival.

⁴³ Bodel (2001:30 and n.13). This figure is the average of the Latin and Greek samples, epitaphs accounting for about three-quarters of the former and half of the latter.

⁴⁴ Keppie (1991: 30-31; 34; 101) presents numerous examples of tombstones being reused in antiquity and modernity for the building of *e.g.* defensive walls, latrines, building foundations. He also explains that while the idea of reusing a tombstone seems shocking by modern sensibilities, this was not always the case. Furthermore, that graveyards even now can disappear after several generations, once all who had connections to those interred have themselves passed on.

⁴⁵ Duncan-Jones (1982:360-361) lists all these factors among others. In terms of Christian cemeteries, most of those on the surface have been lost or destroyed, but those beneath the ground have yielded the bulk of surviving sepulchral inscriptions (Galvao-Sobrinho 1995: 441; 445 n.51).

⁴⁶ Bodel (2001:6); Galvao-Sobrinho (1995: *passim*).

epigraphic habit began to spread.⁴⁷ Though other cultures had their own epigraphic traditions, the erection of epitaphs and the practice of age recording in particular were distinctly Roman.⁴⁸ In time soldiers would bring Roman customs to the frontiers of the expanding empire⁴⁹ and other cultures would adopt Roman practices.⁵⁰

Demographics

The Demographic Value of Tombstones

Much scholarly debate has focused on the use of epitaphs as a source for demographic models of the Roman empire.⁵¹ As the present sample is spread so thinly

⁴⁷ Bodel (2001:7-8)

⁴⁸ Bodel (2001: 6); Mócsy (1966:419-420); Rutgers (1995:107). Bodel refers to the Roman rather than Latin epigraphic habit citing similar patterns in the production of inscriptions in the Greek East and Latin West.

Kajanto (1963a:7) calls age-recording an ‘ordinary’ feature of Roman epitaphs. As ages appear in 43,000 cases, as per Szilágyi (1961-7), they only account for about 20-25% of all epitaphs by most estimates. A *common* feature might be a more accurate description.

⁴⁹ Keppie (1991:80-81) calls epitaphs the most common form of military inscriptions.

⁵⁰ Rutgers (1995:101-106) provides an overview of the spread of age recording and its adoption by various cultures. Jewish funerary inscriptions that provide such information are very rare and the few that do so record the ages in Latin or Greek, rather than Hebrew or Aramaic. The earlier examples come from the city of Rome and it takes several centuries for the practice to make its way back to the East. On the whole, age recording is foreign to the Ancient Near-East. It was brought to Arabia and Syria by the military and not until the late fourth century do indigenous examples appear in the epigraphic record. The Etruscans, too, did not record ages until after their conquest by the Romans. Likewise, in Punic inscriptions at Carthage there is no evidence for age recording; however, in Neo-Punic inscriptions there is.

Rutgers (1995:137-138) also considers why the Jews would have adopted this Roman practice. He lists a number of possibilities, most of which argue for some form of copying Roman traditions, either by choice (*e.g.* copying Roman tombstones) or by constraint (*e.g.* hiring the same stonecutters). He concludes that the two cultures must have shared an “organic and dynamic” relationship which allowed for cultural exchange.

⁵¹ Szilágyi (1961-67) is the extreme example of using epitaphs as a demographic source without reservation. Nordberg (1963) also expresses few qualms about his dataset, though he does latch on to the untenable view that various inaccuracies and deficiencies in his data can cancel out one another to yield sound results.

Éry (1969) is particularly helpful for summarizing the state of scholarship and dividing scholars into three camps: those in favour of demographic analysis, those conditionally in favour, and those opposed.

through space and time and at the mercy of epigraphic bias and rates of inscriptions survival, it could not possibly form a representative sample of those who undertook this practice.⁵² It will suffice to note that the sample does include tombs both commemorating and set up by soldiers, slaves, freedmen, plebeians, and equestrians;⁵³ pagans and Christians; men and women; the very young and the very old. Any detailed conclusions drawn on the sparse evidence would be highly speculative. Rather than providing solid demographic data, Hopkins puts it best: “Commemorative practice is useful for analyzing Roman commemorative practice ...”.⁵⁴ Further, he is right to say that too much attention is given to the data and too little to the society that accounts for the data.⁵⁵ The latter is the greater concern in the present work.⁵⁶

What he finds after analyzing Szilágyi’s results is that they in no way accord with realistic models. Salmon (1987) and Hopkins (1966; 1987) are of a like mind in finding serious flaws in the evidence provided by tombstones that must be addressed, while Parkin (2003:36) sees tombstones as an unsuitable basis for demographic models. Scheidel (2001) identifies a number of problems that arise from using records such as epitaphs as the sole basis for models of the Roman population, either when taken *en masse* for the empire as whole, or when studied on a more local scale, such as a single cemetery. He concludes that factors of geomorphology, climate, epidemiology, and ecology can all contribute to more accurate demographic models (2001:26).

⁵² Clauss (1973:408-409) gives 75 inscriptions as the bare minimum to assemble a dataset, but 300-400 to achieve sound results. Though the present sample is more than double that size, its wide scope lessens the validity of any results there are to be gleaned, as compared with a more focused sample – say, several hundred confidently-dated graves from a single cemetery that was used over several decades.

⁵³ *E.g.*: CIL 09, 01663 (equestrian); CIL 06, 22859 (slave); CIL 06, 17544 (freedman); AE 1973, 00595 (veteran); CIL 06, 06192 (eye doctor); AE 1997, 01591 (stonemason).

⁵⁴ Hopkins (1987:115). Rutgers (1995:137) concurs with this assessment.

⁵⁵ Hopkins (1987:126).

⁵⁶ Rather than lavishing attention on the minutiae of who set up inscriptions with hours, in Chapters 2 and 3 the focus will be on the motivations of two major commemorating groups, the pagans and the Christians.

Demographics and Commemorative Practice

The *communis opinio* holds that Roman epitaphs do not serve as a sound foundation upon which to build a model of the demographic structure of Roman society with reference to metrics such as mortality rate and life expectancy. As the epigraphic corpus is a function of both commemorative practices and rates of inscription survival, recovery, and publication, conclusions cannot be drawn from this corpus if they depend on the assumption that the corpus is a *representative* sample of Roman society. It is necessary to acknowledge the inherent bias in the sample in terms of those commemorated and commemorating.

Nonetheless, certain statistical norms should remain constant regardless of any adequate representation of Roman society in the sample. Deviations from these norms should arouse attention both in complete, representative samples and in incomplete, biased samples. These norms serve as a check on the validity of the sample and the adherence of the data to them is a prerequisite for demographic analysis, for aberrances undermine any models proposed.

Analysis of commemorative practice differs in its goals from demographic analysis; there is no requirement – convenient though it would be – that commemoration preserve the demographic structure of a society with some measure of accuracy. While statistical anomalies are indicative of unsound demographics, they should for no reason be taken as a sign of unsound evidence for commemorative practices. An ideal random sample should be statistically normal, and likewise, a selection from a random sample ideally should display the characteristics of the original sample. The presence of anomalous statistical patterns is every bit as significant as the presence of non-deviant

statistical patterns.

Thus, a commemorative approach is granted more leeway than a demographic approach, for the former seeks to study only those commemorated or commemorating, whereas the latter seeks to interpolate amongst its fragmentary sample the remainder of society even though the sample cannot yield this information. In this vein, I wish to align myself with Hopkins, Scheidel, Éry, Parkin, Salmon, Duncan-Jones *et al.*, in contrast to Armini, Nordberg, Szilágyi *et al.* on the merits of demographic analysis based upon Latin inscriptions.

Pagan and Christian Inscriptions

Chapters 2 and 3 will argue that the practice of recording *horae* in epitaphs, though pagan Roman in origin, was appropriated by the growing Christian community in the Roman empire and imbued with new religious significance. Given the different motivations for including such information in the two religious groups, delineating which subset of the working corpus comprises the pagan epitaphs and which subset comprises the Christian appears crucial.⁵⁷ While I agree with this sentiment, my assent is contingent on being able to categorize the inscriptions with confidence.⁵⁸ Yet uncertainties preclude

⁵⁷ Kajanto (1963a:1) cites that "... Christian and pagan epitaphs so differ that they cannot conceivably be discussed together." However, his decision to disregard the Christian sample altogether ignores the issue rather than addressing it.

⁵⁸ Many characteristics of Christian inscriptions have been noted. Aside from obvious indicators, such as distinctly Christian names or iconography, such as a cross or a Chi-Rho, several other trends have been identified. Keppie (1991:107, 121-123) notes that Christian epitaphs are very often dated, are simple in form, make an effort to record the duration of life with precision, and can measure lifespan not from birth, but from baptism in the case of neophytes. Nordberg (1963:63) offers that familial relationships, such as marriages, receive greater attention in Christian epitaphs.

doing so, and while many pagan and Christian inscriptions can be identified confidently, oftentimes inscriptions will bear no indicators of religion, and consequently too large a number would remain uncategorized.⁵⁹

There are dangers in categorizing these inscriptions on the basis of too little evidence or in making broad generalizations. The inscriptions of the undifferentiated sample, though exhibiting similarities in form, would have been set up for different reasons. Thus, for instance, declaring all inscriptions in which the commemorated has but a single name to be graves of Christians could inadvertently misclassify pagan inscriptions and could lead to skewed results on the basis of faulty data. Contrary to Kajanto's claim, I maintain that it matters very much in which category these inscriptions are placed.⁶⁰ However, as the evidence will not allow for a more conclusive result than confirming that indeed both Christian and pagans did commemorate in this manner, without giving a sense of the relative sizes of the samples, there is no need to sort the inscriptions along these lines; the exercise would provide no more information than what is already known. The knowledge that both pagan and Christian epitaphs are present in

⁵⁹ Contrary to n.58, many characteristic traits of Christian epitaphs are characteristic of pagan epitaphs as well. Keppie (1991:63) tempers his list of Christian features of epitaphs with the admonition that "It would be wrong to over-emphasize the differences between Christian and pagan texts of the third and fourth centuries, or to imagine that all late texts are Christian." Kajanto (1963a:3-4; 1963b:14) advises that care be taken not to assume all those who have but a single name recorded are Christians, for a lone *cognomen* could indicate an immigrant, a slave, one whose name was abbreviated in an effort to save space on their tombstone, or someone of a later period when the *nomen* was no longer commonly used.

On the other hand, Galvao-Sobrinho (1995:438 and n.35) notes that it was not unknown for post-Constantinian Christian epitaphs to include characteristically pagan symbols or formulae, such as *DMS*.

⁶⁰ Kajanto (1963a:1) "If an epitaph lacks Christian symbols and specific Christian nomenclature, if its expressions have nothing distinctly Christian in them, and if the location where it was found is not known, or is known only approximately, it is not easy to tell whether the epitaph is to be classed as pagan or Christian. ... it hardly matters in which group one includes epitaphs which lack distinctive Christian or pagan features."

the sample will provide the basis for analyses of Chapters 2 and 3, respectively. The exact number of inscriptions in each category will be irrelevant for the discussion.

Temporal Distribution

Securely Datable Inscriptions

There are twenty inscriptions in the collection that contain imperial titulature or that explicitly reference consular, regnal, or provincial years, or years measured from some other epoch (*cf.* Appendix IV). Three of these feature literary or poetic usages of *horae*, seven have durations, and the remaining ten include specific times. They date as follows:

Literary/Poetic Uses

- | | | |
|-------------------|------------------------------|---------------------------------|
| 1. CIL 10, 06785 | Latium et Campania / Regio I | 22 BCE/6 CE/32 CE ⁶¹ |
| 2. CIL 08, 20277 | Mauretania Caesariensis | 300 CE ⁶² |
| 3. ICUR-02, 04159 | Rome | 612 CE ⁶³ |

⁶¹ The inscription dates to the year of the consulships of Lucius Arruntius and Titus Flavius Bassus. There was a Lucius Arruntius who served as *consul ordinarius* in 22 BCE along with Marcus Claudius Marcellus Aeserninus and again in 6 CE along with Marcus Aemilius Lepidus (Degrassi 1952:4, 6; Degrassi 1954:171, 173). His adopted grandson Lucius Arruntius Camillus Scribonianus was *consul ordinarius* for 32 CE along with Gnaeus Domitius Ahenobarbus (Degrassi 1952:10).

Titus Flavius Bassus is more of a problem. The only attested person of that name is a soldier of the *Alae Noricum* whose name is recorded on CIL 13, 08308, his gravestone. There are a number of consuls with Titus Flavius in their names (three of whom would go on to become the emperors Vespasian, Titus, and Domitian) but all of them served after the Lucii Arruntii by a range of about a decade to over four centuries. Thus, to which of these dates the inscription refers remains uncertain.

Degrassi (1952:113, 153, 181) places the pair of them in the second century CE, though no reason is given for this.

⁶² The inscription dates to *a(nno) p(rovinciae) CCLX*. Mauretania Caesariensis became a province of the empire in 40 CE. One must simply add two-hundred and sixty years.

These three inscriptions show that the practice of making literary references to hours was in use from at least the very early days of the Roman Empire, through Rome's decline and fall, until six centuries later when Rome was just an outpost of the Byzantine Empire. This should come as no surprise, for, in essence, this practice signifies a perfectly standard use of the noun *hora*.

Durations

1. CIL 06, 10743	Rome	163 CE ⁶⁴
2. CIL 14, 02257	Rome	211 CE ⁶⁵
3. CIL 08, 21479	Mauretania Caesariensis	319 CE ⁶⁶
4. ILCV 01470	Mauretania Tingitana	345 CE ⁶⁷
5. CIL 13, 02798	Lugdunensis	378 CE ⁶⁸

⁶³ The date of the deceased's burial is *oct(avum) Idus Mai{i}(as) imperante dom(ino) n(ostro) Heraclio [...] anno eius II*. Heraclius was emperor of the Byzantine Empire from October 5, 610-February 11, 641 CE (Degrassi 1952:286). The eighth day before the Ides of May in the second year of his reign would have been May 8th, 612 CE.

⁶⁴ Marcus Pontius Laelianus and Aulus Iunius Pastor are indicated as consuls for the year of death. Clinton (1964:187) provides the date.

⁶⁵ The epitaph is inscribed below a dedication to *d(omini) n(ostri) Imp(eratoris) Caes(aris) Marc(i) | Aureli [[[Antonini]]] | Pii Felic(is) Aug(usti) ponti[[f(icis)] | maximi trib(unicia) pot(estate) II[I] | co(n)s(ulis) III p(atris) p(atriciae) divi Seve|ri nepotis*. The titulature dates to 211 CE (Kienast 2011:162-164).

⁶⁶ The year is given as the two-hundred and seventy-ninth of the province. *Cf.* n.62.

⁶⁷ The consular year given is that of Amantius and Albinus. Flavius Amantius and Marcus Nummius Albinus were *consules ordinarii* for 345 CE (Bagnall *et al.* 1987:224-225).

⁶⁸ The year of death is recorded as: *Valente VI et Valentiniano II cons(ulibus)*. The consuls here, Flavius

- | | | |
|---------------------|---------|----------------------|
| 6. BCTH-1910-CCXVII | Numidia | 404 CE ⁶⁹ |
| 7. CIL 06, 09313 | Roma | 404 CE ⁷⁰ |

These seven inscriptions cover a span of approximately two-hundred-and-fifty years, starting in the Antonine Period and continuing through to the Theodosian Period.⁷¹ The earliest two come from the city of Rome, while the later four are distributed amongst Africa and Europe. While this is by no means sufficient data to show conclusively that this practice originated in Rome and was later adopted in the provinces, it is enough to impress the notion upon the mind.

Points in Time

- | | | |
|------------------|--------------------|---------------------|
| 1. CIL 10, 04881 | Samnium / Regio IV | 43 CE ⁷² |
|------------------|--------------------|---------------------|
-

Iulius Valens Augustus and Flavius Valentinianus Iunior Augustus, are the emperors Valens and Valentinianus II. Their sixth and second consulships, respectively, place this inscription in 378 CE (Bagnall *et al.* 1987:290-291; Kienast 2011: 330, 335).

⁶⁹ The 210th year of the province is recorded. Numidia split from Africa Proconsularis in 193 CE.

⁷⁰ The year of death recorded is *do(mino) Honorio Aug(usto) V[...] cons(ule) [...]*. The Emperor Honorius was consul for the fifth time in 402 CE (Bagnall *et al.* 1987:338-339), but the lacuna immediately following the *V* seems indicative of a numeral from *VI* to *VIII*. Honorius' sixth, seventh, and eighth consulships were in 404, 407, and 409 CE, respectively (Bagnall *et al.* 1987:342-3; 348-9; 352-3). However, in the Western empire in 404 CE Honorius was recorded without a second consul (Bagnall *et al.* 1987:342).

⁷¹ The Greek inscriptions with durations date from 218 CE (SEG 7:365; PHI *ad loc.*) to 588 CE (SEG 34:1469; PHI *ad loc.*).

⁷² This tombstone provides dates of birth and death, though it lists only one consul in each case: Lucius Nonius Asprenas for the birth; Aulus Gabinius Secundus for the death. Aulus may have served as *consul suffectus* from July-December of 35 CE and again from August-September of 43 CE. Degrassi (1952:10, 12) reconstructs these positions with similar names, though A. Gabinius Secundus would fit. Degrassi (1952:13) does however note that Aulus held the consulship “poco prima del 45”.

As for the birthdate, consuls named Lucius Nonius Asprenas served as *consul suffectus* in each of 36 BCE, 6 CE and 29 CE (Degrassi 1952: 6, 9; 1954: 170, 173). The deceased is commemorated as an *aedile*

2.	AE 1955, 00201	Africa proconsularis	126 CE ⁷³
3.	AE 1982, 00985	Mauretania Caesariensis	260-279 CE ⁷⁴
4.	ILCV 04377	Roma	After 364 CE ⁷⁵
5.	CIL 09, 06192	Apulia et Calabria / Regio II	392 CE ⁷⁶
6.	CIL 06, 09161	Roma	After 400 CE ⁷⁷
7.	CIL 05, 06227	Transpadana / Regio XI	419 CE ⁷⁸

and would have had to have been at least thirty-six years old at the time of his death to achieve this station. On this reasoning, 29 CE can be dismissed as a possibility for his birth, for he was no child at his death. Similarly, were he to have been born in 6 CE, he could not have died an *aedile* in 35 CE; dying on his thirty-ninth birthday in 43 CE, however, he could well have been one. Likewise, if he were to have been born in 36 BCE, either date could work for his death, though it would leave one to wonder why he never progressed through the *cursus*. Seeing as thirty-nine was the minimum age for a *praetor*, dying on his thirty-ninth birthday would be a logical explanation for this cessation of political advancement, and so the dates of 6-43 CE seem the best fit.

⁷³ Africa Proconsularis became a Roman possession in 146 BCE. The (partially reconstructed) year is given as the two-hundred-and-seventy-first of the province.

⁷⁴ The inscription cuts off part way through the provincial year (*cf.* n.62). *CCXX*, as preserved, leaves *CCXX-CCXXIX* as options.

⁷⁵ The boy commemorated here was born after the consulship of Flavius Iovianus Augustus, *i.e.* the emperor Jovian, and Flavius Varronianus in 364 CE (Bagnall *et al.* 1987:262-263). No year of death is given, nor is the boy's age recorded. The uncertain reference to the consuls could indicate that consuls for the next year had not been chosen or that this was the closest consular year the dedicator could remember.

⁷⁶ The year given is that of the consulships of Flavius Arcadius Augustus, *i.e.* the emperor Arcadius, and Flavius Rufinus (Bagnall *et al.* 1987:292-293).

⁷⁷ The inscription is fragmentary and is datable based on this section: ... *post] consulatum F(lavi) Stilichonis | [...] Secundo cc(onsulibus)*. Flavius Stilicho held the consulship in 400 CE with Aurelianus and again in 405 CE with Flavius Anthemius. If everything is taken in reference to one year, then *secundo* is a reference to F. Stilicho's second term in 405 CE. Degrassi (1952:87) notes that the year 406 CE was recorded as *post consulatum Stilichonis II*, but this would fail to account for the gap in the inscription and the abbreviation *CC* indicating multiple consuls. However, in that case, there would be no space left in the inscription in which to interpolate the name of the second consul. If *secundo* is part of a second consular year, then the best options – limited by the fact that this is the grave of a child – are the second consulships of F. Stilicho (405 CE), Theodosius II (407 CE) or Constantinus III (417 CE) (Bagnall *et al.* 1987: 334-335; 344-345; 348-349; 368-369).

8. CIL 08, 16516	Africa proconsularis	509 CE ⁷⁹
9. IHC 00254	Hispania citerior	926 CE ⁸⁰
10. IHC 00258	Hispania citerior	1039 CE ⁸¹

The last two inscriptions here seem more indicative of imitations in the style of earlier Roman antecedents than evidence of an unbroken Latin epigraphic habit lasting from the early days of the Principate through the fall of the Western Roman Empire, the rise and fall of the Umayyid Caliphate, and into Reconquista Spain. Thus, the first eight inscriptions can be understood to (making that statement a bit less definite, but not flimsy) demonstrate a continuous tradition extending at the very least from the mid-first century CE to the early sixth century CE.

⁷⁸ The consuls' names are abbreviated but Flavius Monaxius and Flavius Plinta are the best fits (Bagnall *et al.* 1987:372-373).

⁷⁹ The year of birth is given as: *ann(o) VII do(mi)n(i) n(o)stri re[gis Tra]/[sa]mundi*. Trasimundus, or Thrasamund, reigned in North Africa as king of the Vandals and Alans from September 496-May 523 CE (Clinton 1964: 143 n.d). The seventh year of his rule would have been 503/4 CE. The (reconstructed) age at death is five years and the death occurs in August. August in the twelfth year of Thrasamund's reign would have been 509 CE.

⁸⁰ The date is given by the phrase *in (a)era DCCCCLXIII*. If the counting here is *ab urbe condita*, then the date is 211 CE. However, the TLL (s.v. 'aera, -ae §2 *vel ēra, -ae*') notes that the word was commonly used in this sense of measuring epochs from the fourth century onwards in Spain. Dating from the establishment of the *Hispaniae* as Roman provinces, in 193 BCE, the date in question is 772 CE. IHC (*ad loc.*), dates the inscription to 876 CE, referring to a Spanish counting, but not explaining why this would begin in 88 BCE.

Neugebauer (1981:371) offers a date of 38 BCE for the start of the "Spanish Era". This would indicate an error in the IHC where the *L* from the year was omitted in the calculation. The fact that IHC 00258 (*cf.* n.81) is calculated based on a start date of 38 BCE corroborates this. Neugebauer (1981:379-380) proposes that there were two systems of reckoning years based on events in Jesus' life, which differed by two nineteen-year lunisolar Easter cycles, for a total difference of thirty-eight years. The two systems developed into the *anno Domini* (beginning in 1 CE) and the *aera Caesaris* (beginning in 38 BCE).

⁸¹ The date is given as *(a)era MLXXVII*. Counting *ab urbe condita* yields a date of 325 CE; counting from the establishment of the province yields 885 CE; IHC gives 1039 CE. *Cf.* n.80. Both this inscription and the previous one come from the site of Oviedo.

Problems and difficulties in Dating Epitaphs

Perhaps the greatest hindrance to arriving at a representative temporal distribution of these epitaphs is the failure of secondary means of dating to provide sufficiently precise and accurate dates.⁸² Differences in palaeography, orthography, linguistic formulae, and numeral forms are just some of the means of dating that can be used, but all too often these indicators are evident only of broad trends and do not suggest narrow ranges of time.⁸³ Information such as detailed imperial titulature which can be dated with relative confidence is almost entirely absent from the epitaphic record.⁸⁴

Owing to the great investment of time required to undertake a thorough analysis of nine-hundred inscriptions in this manner – with no guarantee to yield a return of any substantial value – it was deemed prudent not to attempt such an endeavor. As many of the inscriptions in the sample are fragmentary or contain nothing but a name and an age,

⁸² Bodel (2001:38) is right to be critical regarding such attempts: “The lumping together of dated and undated material into temporal blocks defined by 25-year intervals, the arbitrary assignation of much of the undated material ... , and the uncertain foundations – and, in many cases, spurious precision – of much of the dated evidence render the conclusions suspect. What are in effect being charted by chronological analyses of this sort are not – or, at any rate, not necessarily – historical changes, but modern dating methods ...”.

⁸³ Gordon-Gordon (1977:217) conclude a thorough analysis of the palaeography of Latin inscriptions with the caveat that such means are unreliable on their own and best used to draw comparisons to examples securely dated by other means. Furthermore, palaeography should not be used with the intention of arriving at specific dates, but rather it is most effective in establishing *termini post et ante quos*. Bodel (2001:51) also downplays the utility of palaeographic dating, providing formulaic phrasing and onomastic practices as more viable alternatives. Galvao-Sobrinho (1995:438), however is wary of all methods: “Christian epitaphs are notoriously difficult to date, especially the earlier ones. Usual dating criteria (of formulae, palaeography, onomastic, iconography, ornamentation, etc.) have proved only occasionally helpful and in fact can at times be deceptive.” Others have simply noted that dating epitaphs is no simple feat (*e.g.* Salmon 1987:100; Duncan-Jones 1990:81 n.1).

Duncan-Jones (1982:362-363) himself demonstrates the inadequacy of such dating methods, arriving at nothing more than a series of half-a-dozen *termini post et ante quos* in a study of prices in Roman inscriptions.

⁸⁴ Keppie (1991:27).

they could offer date ranges on the order of centuries at best.⁸⁵

That is not to say that the approach taken when considering these epitaphs will be fully synchronic; rather, that for present purposes, *i.e.*, determining why these epitaphs were set up, two broad categorizations will suffice. The evidence shows that such inscriptions were set up both by pagans and by Christians.⁸⁶ Furthermore, the general epigraphic habit indicates that the vast majority of inscriptions before Constantine are pagan, whereas the vast majority thereafter are Christian.⁸⁷ As Chapters 2 and 3 will demonstrate, pagans and Christians had different motivations for recording hours on their tombstones. Though the Christians adopted a pagan practice, they attached to it connotations of salvation and resurrection. Thus, the main distinction is between Christian and non-Christian inscriptions. As such, it is enough to note that pagans (primarily in the period of the first-early fourth centuries CE) recorded hours for one reason, whereas Christians (in the late fourth-sixth centuries CE) recorded hours for another reason.

Although the fourth century is most common among the dated examples, this is not reason enough to infer that the recording of hours peaked at that time; a sample of twenty inscriptions is hardly representative. Broad trends, however, argue for the practice

⁸⁵ These concise epitaphs are particularly common in the North African provinces, about which Duncan-Jones (1977:350) writes in reference to Szilágyi's division of his corpus into pre- and post-200 CE groups: "... it can be virtually impossible to differentiate second from third century funerary inscriptions ...".

⁸⁶ While, overtly pagan inscriptions are far more common in the dataset than those that are overtly Christian, the presence of hundreds of examples from, *e.g.* ICUR and ILCV, attests to a large Christian element to the sample.

⁸⁷ According to Galvao-Sobrinho (1995:462) this trend is not reflected in the epitaphic record until a few decades after Constantine.

gaining prominence towards the middle of the spectrum established by the datable examples. The recording of years was common as of the second century; the recording of months and days as of the third.⁸⁸ It is tempting to situate the recording of hours in this third century context of greater precision in age recording.

As the crucial divide in the dataset is between Christian and non-Christian epitaphs, the question of when Christianity comes to prominence is important. The key to answering this question, according to Galvao-Sobrinho, is determining when the adoption of Christian practices by average Romans becomes more the rule than a series of isolated cases.⁸⁹ Though Constantine's reign and, in particular, the Edict of Milan in 313 CE are seen as watersheds, some place the general transition to Christianity earlier.⁹⁰ Yet, Galvao-Sobrinho, on the basis of the epigraphic evidence, situates the turning point much later in the late fourth or early fifth century.⁹¹ Most important to him is the way in which the distribution of Christian funerary inscriptions points to the geography and chronology of the spread of Christianity.⁹²

⁸⁸ Keppie (1991) 107.

⁸⁹ Galvao-Sobrinho (1995:435): "Historically, it makes a tremendous difference to say that at any time before Constantine the majority of the population was Christian. ... opinions continue to be divided." Had the transition occurred at that point, the vast majority of the working corpus would likely consist of Christian epitaphs, with few pagan examples.

⁹⁰ Galvao-Sobrinho (1995:431).

⁹¹ Galvao-Sobrinho (1995:461-2). He places the transition later than most (about half a century after Constantine), allowing time for the newly legalized practice to gain followers. The epigraphic record reflects this with a delay of a decade or two, for it is not until the converts die that their epitaphs can be set up.

⁹² Galvao-Sobrinho (1995:462).

Statistical Anomalies

Accuracy vs. Precision

With some exceptions,⁹³ indicating precisely how long someone lived or exactly when they died has generally been identified with Christian practice and, hence, is thought to be a later tradition.⁹⁴ Precision is no guarantee of accuracy, for incorrect figures are incorrect regardless of how precise they are. In the later periods, the epigraphic record shows evidence that the ancients were somewhat cognizant of this paradox, and made more of an effort, through the use of phrases such as *plus minus*, to record their own doubts as to the validity of the figures they inscribed.⁹⁵ Furthermore, different social and cultural groups not only had varying commemorative practices, they also commemorated different age groups in different ways.⁹⁶ In the city of Rome, for instance, Romans gave more attention to those who died young, whereas Greeks were more concerned with the elderly.⁹⁷

⁹³ Paine-Storey (2006:93) describes a series of Republican burials beyond the Aurelian Walls which are exceptional for the attention they pay to recording the precise date of death. This group of burials marks one of few pre-Christian examples that place great attention on when someone died.

⁹⁴ Galvao-Sobrinho (1995); Nordberg (1963).

⁹⁵ Nordberg (1963:26; 28-9) offers that the use of the phrase *plus minus* increased from the fourth to sixth centuries. His claims, however, that the figures with *plus minus* are more accurate; that *plus minus* with years alone refers to a rounded age, but that with several units of time it refers to the most precise; and that figures were first rounded in the early fourth century, prompting the development of the phrase *plus minus*, are all highly debatable.

⁹⁶ Parkin (2003:36) presents this as a possible explanation for the prevalence of centenarians in the epigraphic record in North Africa.

⁹⁷ Éry (1969:60).

Figure 3 – The Figures of *Horae* Recorded

Multiples of Three

Of the figures of hours recorded (*cf.* Figure 3), the vast majority (98%) fall in the range of 1-12. The distribution among these numbers is fairly even and hovers around 60 instances ($\pm 15\%$), with two exceptions: it drops off at either end of the spectrum and the numbers three and six are overrepresented. Multiples of three are not convenient figures for rounding when using Roman numerals; hence this is not evidence of rounding, but rather an indication of digit preference.

Digit preference can occur when a society assigns positive connotations to certain

numbers. Here, the digit preference corresponds to the overlap of two systems of referring to time that were in use concurrently. This will be discussed more thoroughly in Chapters 2 and 3.

Extremely High Values

Extremely high values for hours do show up in the dataset. These values can be divided into two groups: those from thirteen to twenty-four and those in excess of twenty-four. There are eight durations and one point in time that fall into the first group.⁹⁸ All of these values are perfectly valid when working within the constraints of a twenty-four hour day. Provided they do not occur in conjunction with references to hours of the night or hours of the day (which they do not) then there is nothing extraordinary about them. The most that can be said about them is that they are far, far rarer in the sample than references based on separate nocturnal and diurnal cycles of hours.

The values above twenty-four, however, are more interesting, for they are in excess of the number of subdivisions of time that hours are required to measure and they could be expressed by the use of a larger unit, such as the day.⁹⁹ There are five instances of this occurrence in the sample. Two use high values of hours in conjunction with larger units,¹⁰⁰ another two do the same but based on questionable reading of stones,¹⁰¹ and the

⁹⁸ Durations: CIL 08, 12338; CIL 08, 18740; CIL 08, 23587; ICUR-10, 27513; ILAlg-01, 00142; CIL 08, 09671; ICMactar-02, 00016; CIL 06, 27448. Point in time: CIL 06, 34624a.

⁹⁹ Armini (1916:7) suggests that figures in excess of twelve months were a way of saving space on the stone and Nordberg (1963:33-34) does likewise for figures in excess of thirty days, yet these explanations seem unlikely to apply to all cases. *Cf.* n.107.

¹⁰⁰ CIL 08, 14380 and AE 1993, 01712, both from North Africa, and giving fifty-nine and fifty-seven hours, respectively, in addition to tallies of days.

fifth only uses hours¹⁰² – likely to emphasize the brevity of the life commemorated and to stress the value of each moment the deceased was alive.¹⁰³

This practice is not exclusive to the figures of hours. Twenty-two durations in the sample feature quantities of days exceeding the length of a month.¹⁰⁴ Granted, none of

¹⁰¹ 1.) *CIL 06, 23646 – Rome*

D(IS) M(ANIBUS) | P() DAILOCHO <Q=O>UI | {I} VIX(IT) ANNIS XXXV | ME(N)S{S}IBUS
V<III=LEL> | <DI=Z>EBUS XXI<I=B> **HORIS L** | UXOR BENE ME {S}|RENTI FEC<I=F>T

*To the spirits of the departed: To P. Dailochus, who lived thirty-five years, eight months, twenty-two days, **fifty hours**. The wife made this for a well-deserving [husband].*

The editor's emendations here, particularly with respect to the numerals, are troublesome. The reading of *VIII* instead of *VLEL* makes sense, for it would be hard to conceive of some other letters that could have been inscribed there. The reading *LEL* could be based on erosion of the stone mistaken for carving, but without an image of the inscription it is impossible to make that claim with certainty. The reading of *XXII* for *XXIB* feels incorrect; *XXIV* might also work. The spelling in the inscription is quite poor and reflects a particular dialect, as forms such as *messibus* and *zebus* attest. These are two of the most common errors in inscriptions of this type, along with *bixit* for *vixit*. While there are several *V*s in the inscription, including in the numerals, it is nonetheless plausible that one might accidentally have been written as a *B*. Finally, the figure of *horis L* could be a misreading of *horis I* on the same reasoning that *VLEL* becomes *VIII*.

2.) *GLIStone 00026 – Rome*

ECHIO PUER | VIXIT ANNUM ET | MENSES VII DIES X | **HORIS DIII**

*To Echius, a boy who lived one year, seven month, ten days, **five hundred and four hours**.*

The figure of *horis DIII* would be equivalent to twenty-one days. Perhaps it is a misreading of *XIII* or *VIII*.

¹⁰² *ILAlg-02-02, 05361 – Numidia (Announa / El Announa / Thibilis)*

IULIU{I}S IA|NUARIUS | **V(IXIT) H(ORAS) XC** | H(IC) S(ITUS) E(ST)

*Julius Ianuarius **lived ninety hours**. Here he lies.*

¹⁰³ Scribal error seems an unlikely cause of such figures, for it would require the accidental reckoning of the figure of days in terms of hours.

¹⁰⁴ *CIL 06, 39070; CIL 08, 02435; CIL 02, 01220; CIL 06, 17840; CIL 06, 14020; InscrAqu-03, 03242; CIL 06, 28923; CIL 06, 26369; CIL 06, 11586; CIL 06, 28644; CIL 08, 09433; ICUR-03, 07697; ICUR-08, 22627; CIL 06, 11086; ICUR-05, 13922; ICUR-06, 17182; CIL 06, 22385; CIL 14, 05222; CIL 06, 07748; CIL 06, 07778; ICUR-03, 09133; ICUR-04, 10154.*

these figures, which range from thirty-two days to seventy days, occur in durations that record months, though most record years. Similarly, three inscriptions in the set record figures between twelve and sixteen months while also recording figures for years.¹⁰⁵ One records sixteen months but does not count years¹⁰⁶ and one does likewise but also rephrases the large quantity of months in terms of years and months.¹⁰⁷

Three inscriptions contain exceedingly high figures for years: one looks like an attempt to stress the longevity of the deceased;¹⁰⁸ one gives an age of just over one hundred years;¹⁰⁹ and the contrast between sheer longevity and finite measurement is so

¹⁰⁵ ICUR-10, 27513; CIL 06, 14702; CIL 08, 28045.

¹⁰⁶ ICUR-03, 07948.

¹⁰⁷ ICUR-01, 00573 – Rome

EUSTINA IN PACE QU(A)E VIXIT MENS|ES **XXIII** HORAS III QUI | ANNUM I ET MENSES XI |
KAL(ENDAS) AUG(USTAS) PATER PIUS FILIAE

*Eustina – [may she lie] in peace – who lived **twenty-three months, three hours, which which is one year and eleven months.** [She died] on the Kalends of August. Pius, the father to his daughter.*

¹⁰⁸ CIL 09, 00907 – Apulia et Calabria / Regio II (Lucera / Luceria)

[IV [FE]]LICISSIM[O] | Q(UI) VIX(IT) ANN(OS) | **LXXXV**III | M(ENSES) XI D(IES)
XXVIII | H(ORAS) XI H(EREDES) E(IUS) F(ECERUNT)

*...IV to a most fortunate man, who lived **ninety-nine years, eleven months, twenty-eight days, eleven hours.** His heirs made this.*

The age of the deceased in this inscription is given as ninety-nine years, eleven months, twenty-eight days, and eleven hours, almost the longest possible way to write out what is essentially one hundred years. In this context, a solitary C seems as though it simply would not do justice to a century lived.

¹⁰⁹ BCTH-1925-CLX – Africa proconsularis (Carthage)

D(IS) M(ANIBUS) S(ACRUM) ORTISIA | VICTORIA | VIX{X}IT ANN|IS C M(ENSIBUS) X |
DIE(BUS) VII HOR(IS) | IIII

*Sacred to the spirits of the departed: Ortisia Victoria lived **one hundred years, ten months, seven days, four hours.***

stark in one that its figures surely must serve primarily emotional rather than numeric functions.¹¹⁰

Age Rounding and Digit Grouping

Age rounding was a widespread phenomenon in the Roman world. It arose out of the inability of people to determine their ages accurately. The quantity to which figures are rounded depends on the number system being used. In the Roman numeral system, numbers ending in *V* or *X* are convenient figures for rounding, whereas numbers ending in *I* are messier.

Several theories have been advanced to account for this, the most convincing of which is the notion that numeracy and literacy are related faculties.¹¹¹ One notable barrier to the accurate reckoning of one's age would have been the cumbersome systems employed for the counting of years.¹¹² This accounts for the existence of inscriptions

N.B. The preponderance of ages at death in the range of 100-150 years preserved in the epigraphic record of Roman North Africa is a noted phenomenon. Mallon (1952) argues that in the *scriptura uncialis* of the North African provinces what the stonecutters intended as *Ls* are often mistaken by modern eyes as *Cs*.

¹¹⁰ *CIL 14, 01196 – Latium et Campania / Regio I (Ostia Antica)*

D(IS) M(ANIBUS) | IULI(A)E SEVERAE | L(UCIUS) A(U)RELIUS FECIT BEN|E MERENTI
CO(N)IUGI | QUAE VIXIT ANNIS{E} | CVXXXX MENS(IBUS) III | HORAS X

To the spirits of the departed: Lucius Aurelius made this for his well-deserving wife, Julia Severa, who lived 135(?) years, three months, ten hours.

¹¹¹ Duncan-Jones (1977) correlates the levels of education of various populations (rural, urban, slaves, etc.) with the prevalence of rounded figures on their tombs. Less convincing is the idea that ages were rounded to save space on the stone, as proposed by Nordberg (1963:26). This seems to be a better case for truncation of ages, such as recording years, but not months or days.

¹¹² Duncan-Jones (1977:336). Consular years were the norm at Rome and in many other places and would have required either a good memory or a written record to maintain sufficient continuity for an adult trying

with rounded or uncertain quantities of years that nonetheless include months, days, and hours.¹¹³ In such cases the inclusion of smaller units is striking, for the rounding indicates that accuracy is not the primary function of the added precision.

Digit grouping is a necessary consequence of age rounding, in that the values to which people round their ages gain prominence in the sample.¹¹⁴ For the current sample, from age 25 onwards there are strong patterns of age rounding and digit grouping (*cf.* Figure 4).¹¹⁵ To take this simply as an indication that people did not know their ages would be incorrect; rather people had a general sense of their ages and did make an effort to render them with some measure of accuracy, given the constraints of their educations and their systems of counting years.¹¹⁶ Thus, ages on tombstones should not be taken as

to tabulate their age. Other systems were also known, especially epochal countings. Best known of these is the system of measurement in Rome *ab urbe condita*, though the use of consular years was favored. In Mauretania, however, dating from the foundation of the province was common (Sandys 1919:203 and Duncan-Jones 1977:336 n.15; *cf.* also n.62, n.66, and n.74). Regnal years could also be used, though interregal periods and the shifts from one reign to the next pose problems. A long-standing tally from a far off date would have afforded the greatest continuity and would have been the most likely to facilitate accurate counting.

Mócsy (1966), in a thorough analysis of the rates of age rounding in the Roman epigraphic sample, cites poor recordkeeping and poor access to records of births as factors contributing to the uncertainty regarding age.

¹¹³ Salmon (1987:110). Moreover, he argues that figures of months and days would be accurate, as people would have known their birthdays but would have lacked the means to tally their ages properly.

¹¹⁴ This differs from an outright digit preference, whereby certain figures could be selected for auspicious or inauspicious reasons. Scheidel (1996:28) noted this phenomenon in Roman Egypt and Rutgers (1995:115 n.72) did likewise in Africa.

¹¹⁵ Meyer (1973:69) notes that ages in epitaphs tend to be rounded past age 50.

¹¹⁶ As the practice of indicating uncertainty using the qualifier *plus minus* attests.

Figure 4 – Age Distribution of Those Whose Epitaphs Record *Horae*

Figure 5 – Age Distribution of Those Whose Epitaphs Record Only Years and Hours

random figures in most circumstances,¹¹⁷ but relatively close estimations.¹¹⁸

Ages Containing Only Years and Hours

Of the seven-hundred and forty-two usable durations collected, thirty-five¹¹⁹ contain only figures of years and hours – no months, no days (*cf.* Figure 5). At first glance this seems indicative of a fair number of people expiring on their dates of birth. However, as this should only occur for every 1 in 365 cases (if leap years and intercalations are to be discounted), the working corpus exhibits the phenomenon with seventeen times expected frequency. Most of these inscriptions are from graves of adults, and of the adults most are seniors.¹²⁰ Thus, the hours cannot serve to add accuracy to these ages for they have already been rounded. Hence, there must be some alternate motivation for recording these more precise units of time.

Finer Units Than Hours

One of the most curious observations to be made about this corpus of inscriptions

¹¹⁷ Centenarians in the North African provinces are particularly troublesome. *Cf.* Parkin (2003) and n.109.

¹¹⁸ Meyer (1973:69), Salmon (1987:110), and Scheidel (1996:59). Rutgers' (1995:120) suggestion that people had only a vague sense of their ages seems a bit harsh.

¹¹⁹ AE 1907, 00132; CIL 06, 02771; CIL 06, 07514; CIL 06, 14427; CIL 06, 18185a; CIL 06, 18409; CIL 06, 20670; CIL 06, 34714; CIL 06, 37098; CIL 08, 02453; CIL 08, 06463; CIL 08, 09671; CIL 08, 12199; CIL 08, 14442; CIL 08, 15708; CIL 08, 18419; CIL 08, 18740; CIL 08, 23238; CIL 08, 23462; CIL 10, 00584; CIL 10, 01531; CIL 10, 02169; CIL 14, 00753; CIL 14, 01318; ICMactar-02, 00014; ICMactar-03, 00003; ICMactar-10, 00021; ICUR-03, 08018b; ICUR-04, 09445; ICUR-07, 20505; ICUR-10, 27152; ILAlg-02-02, 05163; ILAlg-02-03, 07563; InscrAqu-03, 03072; SupIt-05-FN, 00066.

¹²⁰ In both this subset and the overall dataset the elderly are commemorated with a much higher incidence than one might expect. McLean (2002:265), in describing Greek epigraphic practice, highlights the fact that children's ages are often given quite accurately – even down to hours. This may well be, but it would be wrong to assume that hours were recorded solely in the case of children, as Figure 4 and Figure 5 attest.

is the extent to which non-standard units of time feature – *i.e.*, those other than years, months, days, and hours – or even that they feature at all. References to the *hora semis*, or half hour, abound (relative to other miniscule units), appearing in twenty-three durations and one time of burial;¹²¹ a night is counted as a unit in one instance;¹²² and various units shorter than hours are recorded, despite the fact that such fine distinctions of time could not have been measured (though that may have been the point). There are also examples of shorter units being employed. First:

¹²¹ The twenty-three durations: AE 1984, 00054; BCTH-1910-CCIII; AE 1933, 00061; AE 2005, 00261; CIL 03, 00492; CIL 03, 06360; CIL 05, 01667; CIL 06, 03558; CIL 06, 08152; CIL 06, 10794; CIL 06, 12526; CIL 06, 16467; CIL 06, 37540; CIL 08, 01972; CIL 08, 18419; CIL 14, 01034; ILCV 02824; ICUR-03, 08850; ILCV 04002a; ILCV 02704; ICUR-07, 19037; CIL 14, 04224; ILCV 02640; and the one time of burial: ILCV 01529a.

¹²² CIL 08, 12794. Of note is the fact that the night comes between the figures for days and hours. In the one comparable Greek example (JIWE 1 12) hours are listed before the night. There are three examples of nights being recorded as units in durations without hours:

1.) *CIL 06, 15514 – Roma*

D(IS) M(ANIBUS) | CL(AUDIAE) NEPTUNALINI | CONIUGI QUAE | VIXIT MECUM | DIEBUS
V NOCTI|BUS IIII P(UBLIUS) OCTA|VIUS IUSTUS MA|RITUS FECIT

*To the spirits of the departed: To Claudia Neptunalis, a wife who lived with me five days, **four nights**. Publius Octavius Iustus, the husband made this.*

2.) *CIL 06, 28721 = AE 1997, +00160 – Roma*

D(IS) M(ANIBUS) | MATER INF|ELICISSIM|A VETTUED|IAE VITALI | FILIAE PISS|IMAE
QUAE | VIX(IT) ANN(OS) XV | M(ENSES) IV NOC(TEM) I

*To the spirits of the departed: A most unfortunate mother to Vetteudia Vitalis, a most dutiful daughter, who lived fifteen years, four months, **one night**.*

3.) *ECampania 00027 = LIKelsey 00264 = AE 2005, 00364 – Latium et Campania /
Regio I (Pozzuoli / Puteoli)*

BENE] MERENTI QUI | V(IXIT) A(NNOS) XIII M(ENSES) III N(OCTEM) I

*... well deserving, who lived thirteen years, three months, **one night**.*

CIL 06, 36122 – Rome

DIS MANIBUS | PLAUTIAE HEURESI P(UBLIUS) PLAUTIUS | FORTIS ET PLAUTIA CAE[...]IA |
PARENTES FILIAE PISSIMAE | FECERUNT VIX(IT) AN(NIS) V MEN(SIBUS) | [...]X DIEB(US)
VIII HOR(IS) III **MIN(UTIS) V** | IN FR(ONTE) P(EDES) II PLUS MINUS IN AG(RO) P(EDES) III

*To the spirits of the departed: Publius Plautius Fortis and Plautia Caef ... Jia, the parents, commissioned [this monument] for Plautia Heuresis, a most dutiful daughter, who lived five years, [...]X months, eight days, three hours, and **five minutiis**, [on a plot] about two feet wide and three feet long.*

Here, the *minutiis* represent a lesser unit than the hour. Second:

CIL 11, 07325 – Etruria / Regio VII (Volsinii)

D(IS) M(ANIBUS) | C(AIO) AVILIO | PROFUTURO | FILIO | DULCISSIMO | QUI VIXIT | ANNIS VI |
MEN(SIBUS) VIII | (H)ORIS VII **UNC(IA) I**

*To the spirits of the departed: [This monument is dedicated] to Gaius Avilius Profuturus, a most charming son, who lived six years, nine months, seven hours, and **one uncia**.*

The *uncia* is the twelfth part of a measure – in the case above, five minutes. Third:

CIL 11, 01513 – Etruria / Regio VII (Pisa / Pisae)

BENE MERENTI IN PACE | SILVANAЕ QUAE HIC DORMIT | VIXIT ANN(OS) XXI MEN(ES) III |
HOR(AS) IV **SCRUPULOS VI** | DEPOS(ITA) IX KAL(ENDAS) IULIAS [...] | QUI [...] IN [...]

*To well-deserving Silvana – [may she lie] in peace – who rests here. She lived twenty-one years, three months, four hours, and **six scrupuli**. Having been buried the ninth day prior to the Kalends of July ... QUI ... IN ...*

Scrupulos here is from *scrupulum*, a variation of *scripulum*, the twenty-fourth part of an *uncia*, or the two-hundred-and-eighty-eighth part of any base unit. An hour so divided yields measures of twelve-and-a-half seconds in duration.¹²³ *Scrupulos VI*, as per the inscription, would then equal seventy-five seconds.

¹²³ OLD, s.v. ‘*scripulum, scrupulum*’. Assuming the abbreviation is correctly expanded, this next example records a lifespan just shy of two minutes:

ILCV 04429a – Africa proconsularis (Sousse / Hadrumetum)

ARISUS I(N) PACE | NATUS (H)ORA SEXTA | <V=B>IXIT **SS(CRIPULA) VIII**

*Arisus – [may he lie] in peace – born at the sixth hour, lived **nine scripuli**.*

The primary purpose in recording such infinitesimal units cannot be to communicate accurately a precisely measured unit of time. Rather, it seems more as though these are emphatic displays, either intended to show emotional attachment, valuing each instant the departed was living, or that they were intended to emphasize the extreme brevity of a life, thereby heightening the tragedy of a premature demise.¹²⁴

The Occurrence of *Horae*

It is interesting to note the inconsistency with which hours appear in epitaphs. For instance, on a gravestone commemorating multiple people, one would expect that the information conveyed for each would be the same. Yet this is not the case:

AE 1996, 00220 – Roma

[D(IS)] M(ANIBUS) | OCTAVIAE | HEURESI | VIX(IT) ANN(OS) XXII[.] | M(ENSES) V D(IES) XV ET | DIONYSIADI | F(ILIAE) EIUS VIX(IT) ANN(UM) I | M(ENSES) X D(IES) XXVII | C(AIUS) HIRTILIUS FIDUS CON(IUGI) B(ENE) M(ERENTI) | FEC(IT) ET | C(AIO) HIRTILIO ZOSIM[O] | FIL(IO) V(IXIT) ANN(OS) III M(ENSES) V D(IES) | XXV H(ORAS) VIII | ET SIBI ET SUIS LI|BERTIS LIBERTA|BISQ(UE) | EORUM | [IN FRONTE P(EDES)] | XII | [IN AGRO P(EDES)]

To the spirits of the departed: To Octavia Heuresis, who lived twenty-three (?) years, five months, fifteen days, and to Dionysiadis, her daughter, who lived one year, ten months, twenty-seven days. Gaius Hirtilius Fidus made this for his well-deserving wife and to Gaius Zosimus, his son, who lived three years, five months, twenty-five days, eight hours, and for himself and for the freedmen of his freedmen twice over. The plot is twelve feet in front and in back ...

Here, Caius Hirtilius Fidus commemorates his wife, daughter, and son, yet only in the case of the son is the duration of life reckoned down to hours. It seems as though the text may have originally ended at *con(iugi) b(ene) m(erenti) fec(it)*. The son's epitaph would then be a later addition and the different time of carving could account for the

¹²⁴ Conversely, *horae* can be employed for the opposite function, namely, highlighting extreme longevity (cf. n.108).

inconsistency in the data.

Likewise, the inclusion of hours in only one of these ages seems suspect:

ILAlg-02-02, 05163 – Numidia (Announa / El Announa / Thibilis)

D(IS) M(ANIBUS) S(ACRUM) | AEMILIA | Q(UINTI) F(ILIA) MATRO|NA V(IXIT) A(NNOS) LXX
 || D(IS) M(ANIBUS) S(ACRUM) | DOMITIUS | L(UCI) FIL(IUS) QUIR(INA) | SECUNDUS | V(IXIT)
 A(NNOS) LXX H(ORAS) VII

Sacred to the spirits of the departed: Aemilia Matriona, daughter of Quintus, lived seventy years. Sacred to the spirits of the departed: Domitius Quirina Secundus, son of Lucius, lived seventy years, seven hours.

Unless the dedicator wished to highlight the fact that Domitius died on his birthday, the inclusions of hours seems out of place, unless of course this figure is not meant to be read as part of the duration.

Yet there are other instances where tombstones give details of differing precision even though they appear to have been carved all at once:

CIL 06, 11637 (p 3509) = Bagno 00007 – Roma

DIS MANIB(US) | SER(VI) ANICI EUNI | VIX(IT) AN(NUM) I | MENS(ES) III D(IES) XIII | ET
 SER(VI) ANICI | PROCULI | VIX(IT) AN(NOS) VI | D(IES) VI H(ORAS) VIII | POSUIT | FILI(I)S
 CARISSIM(IS) | SER(VIUS) ANICIUS | TYRANNUS

To the spirits of the departed: To Servius Anicius Eunus, who lived one year, three months, thirteen days, and to Servius Anicius Proculus, who lived six years, six days, nine hours. Servius Anicius Tyrannus set this up for this dearest sons.

In this case, a father commemorates his children, giving the age of one with hours as the most precise unit, but only giving the other in terms of days. Strikingly, it is the elder child whose age is more precise. On the assumption that the older one gets the more difficult it is to recall their age accurately, it would make more sense for the younger child in each case to have hours appended to their age.

Hewing closer to the expected model is this gravestone of a mother and son:

CIL 06, 12483 – Rome

D(IS) M(ANIBUS) | ARTORIAE | DOXAE | EUHODIAE VIX(IT) | ANN(IS) XXVIII P(LUS)
M(INUS) | C(AIUS) ARTORIUS | SECUNDUS CONIUGI | SANCTISSIMAE | ET ARTORIO |
ADIUTORI FIL(IO) | QUI VIXIT ANNO I MENSIBUS IIII DIEBUS XV HORIS X

To the spirits of the departed: Artoria Doxa Euhodia lived approximately twenty-eight years. Gaius Artorius Secundus [erected this monument] for his most pious wife and for Artorius Adiutor, their son, who lived one year, four months, fifteen days, ten hours.

Here, the husband and father presents his son's age with great precision, but he has only the vaguest sense of his wife's age. Whereas the son's age contains four unqualified figures, the one figure given for the wife, that of years, is flagged by the phrase *plus minus*, indicating uncertainty.

An interesting contrast is when the exact opposite of what is expected occurs:

CIL 08, 12199 = CIL 08, 16281 = ILTun 00598 – Africa proconsularis (Sidi Amara / Agger)

BITORINA IN (CH){I}RIS(T)O A(MEN) | <v=B>I<x=C>({S}IT) AN(NO)S XXV (H)ORAS
[PL(US)] | MINUS V

Bitorina – in the name of Christ, Amen – lived twenty five years, five hours, or thereabouts.

Here it is the figure of years that is precise, but the figure of hours where the dedicator expresses doubt. This raises the question of why to include such precise information if its accuracy cannot be vouched for. In a sense including unreliable information undermines the intentions of the dedicator, for in choosing how to remember the deceased they acknowledge that they have already begun to forget.

Both on an individual basis and as a group, inscriptions recording *horae* raise many questions. While not all of these can be answered, some of the more pressing ones can be addressed.

The Function of References to Hours

Despite the fact that the ratio of inscriptions where *horae* are recorded in durations to those where *horae* are recorded as points in time is approximately 10:1, I contend that in the vast majority of cases where lifespans contain figures of hours, these function as references to the time of death. Two examples will help to illustrate this (as will the discussion of the recording of births in Chapter 2). First:

CIL 06, 13602 – Rome

D(IS) M(ANIBUS) | BLASTIONE VIX(IT) AN(NIS) VI | MENSIB(US) VIII DIEB(US) XIII
HORA I | NATUS V K(ALENDAS) SEPTEMBRES | HORA DIEI VI DIE LUNAE | DEFUNCTUS
III IDUS IUNIAS | HOR(A) PRIM(A) DIEI DIE SATURNI | ITEM MATRI EIUS QUAE VIXIT |
ANNIS XX DIEB(US) XXX HORIS X | RELIQUIT EUM MENS(IUM) XII D(IERUM) XX |
BLASTUS PATER FILIO PISSIMO | FECIT

*To the spirits of the departed: Blastione lived six years, nine months, fourteen days, **one hour**. Born on the fifth day before the Kalends of September, a Tuesday, **at the sixth hour of the day**, he died on the third day before the Ides of June, a Saturday, **at the first hour of the day**. Also, to his mother, who lived twenty years, thirty days, ten hours. She predeceased him by twelve months and twenty days. Blastus, the father, made [this monument] for [his] most dutiful son.*

This epitaph of Blastione is exceptional, for it is the sole specimen in the sample that features a date and time of birth, a date and time of death, and a duration of life – all undamaged. But do these three figures accord? The lifespan can be added to the date and time of birth as follows:

Blastione is born:	<i>V Kalendas Septembres hora diei VI</i>
Add <i>annis VI</i> :	<i>V Kalendas Septembres hora diei VI</i>
Add <i>mensibus VIII</i> :	<i>V Kalendas Maias hora diei VI</i>
Add <i>diebus XIII</i> :	<i>V Idus Maias¹²⁵ hora diei VI</i>
Add <i>hora I</i> :	<i>V Idus Maias hora diei VII</i>

This result is about a month shy of the date of death inscribed. If, however, a small error

¹²⁵ The Ides of May falling on the 15th of the month.

in calculation on the part (presumably) of Blastus, the father and dedicator, is assumed and the figure of *mensibus VIII* is incremented to *mensibus X*, the sum proceeds as follows:

Blastione is born:	<i>V Kalendas Septembres hora diei VI</i>
Add <i>annis VI</i> :	<i>V Kalendas Septembres hora diei VI</i>
Add <i>mensibus X</i> :	<i>V Kalendas Iunias hora diei VI</i>
Add <i>diebus XIII</i> :	<i>III Idus Iunias</i> ¹²⁶ <i>hora diei VI</i>
Add <i>hora I</i> :	<i>III Idus Iunias hora diei VII</i>

Thus, the correction yields a result that corroborates the two dates. However, the figure of *hora diei VII* does not match the *hora prima diei* at which Blastione is said to have died.¹²⁷

This next example accounts for the discrepancy:

CIL 05, 00914 - V enetia et Histria / Regio X (Aquileia)

D(IS) M(ANIBUS) | FLA(VIUS) AUGUSTALIS CENT(URIO) | LEG(IONIS) PRI(MAE) IT[ALICA]ES MILITA[VIT] ANNIS V ME(N)S(IBUS) VI DIE(BUS) | XII (H)ORAS III VIXIT ANNIS | XLI ME(N)S(IBUS) VII DIE(BUS) XV (H)ORAS | III (H)ABUIT CO<N=M>IUGEM C|ASTORINAM ANNIS | VIII ME(N)S(IBUS) III DIE(BUS) VI (H)ORAS | III ET FILIUM STERCORIUM | QUI VIXIT AN(NIS) III ME(N)S(IBUS) VII DI[E(BUS)] X (H)OR(AS) VI SUPRAVIXIT PATER | DIE(BUS) XLVII POSUIT TIT<U=O>LUM | CAS(TORINA) CO<M=N>P(ARI) CA(RISSIMO) SUO

*To the spirits of the departed: Flavius Augustalis, centurion of the legion Prima Italica, served five years, six months, twelve days, **four hours**; lived forty-one years, seven months, fifteen days, **four hours**; had a wife, Castorina, for eight years, three months, six days, **four hours**; and a son, Stercorius, who lived three years, seven months, ten days, six hours. The father outlived [his son] by forty-seven days. Castorina set up the inscription to her most dear companion.*

¹²⁶ The Ides of June falling on the 13th of the month.

¹²⁷ It would be unwise to entertain the possibility that the figure of hours in the duration was incorrectly calculated, much like the figure of months, for, were that the case, the correct figure would have to be negative five. Also unlikely is the possibility that either the figure for the time of birth or the time of death is incorrect. In the former case, in order to get to *hora prima diei* by adding *hora I*, the starting point would have to be *hora noctis XII*, which is too far from *hora diei VI* to be an error in the carving. Likewise, in the latter case, the text as inscribed differs too much from any other possibility for it to be an error; of all the figures on the tombstone, it alone is written out in the form of an ordinal adjective, rather than a numerical figure.

Note that this epitaph records the length of Flavius' military service, his lifespan, and the length of his marriage. Note further that all three of these figures end in the same figure of four hours. The figures of hours are not measuring these durations from their moments of inception. As Flavius' career and life and marriage all ended at the same time, the figure of hours in each case records the last fractional day of each duration. Similarly, in the previous example the figure in the duration (*hora I*) represents the last fractional day lived and, hence, corresponds to the time of death (*hora prima diei*).

Revising Readings of Inscriptions

This interpretation of the function of *horae* can help to correct inscriptions that were edited without a full understanding of the use of *horae* in funerary inscriptions. I wish to demonstrate how this can alter the reading of an inscription edited without this knowledge. Consider the age recorded in the following inscription:

ICUR-05, 15277 – Roma

D(IS) MM(ANIBUS) | [CAS]TISSIMAE ET INNOCE[NTISSI]M(A)E CO(N)IUGI [BONAE
M]EMORIAE | [CAE]LESTINAE **QUAE VI[XIT ANNIS PLUS] M(I)N(US) [VIGINTI DU]OBUS |**
[MEN]S(IBUS) III MECUM VIXIT SINE UL[LA QUERELLA ET AEMUL]ATIONE | [ANNIS] VI
MENS(IBUS) II **HORIS III** VICTORINU[S]

*To the spirits of the departed: To the good memory of a most pure and blameless wife, Caelestina, **who lived about twenty-two years, three months**. She lived with me without any complaint or envy for six years, two months, **three hours**. Victorinus [set it up].*

Caelestina's age is reconstructed here as approximately twenty-two years and three months; her marriage is said to have lasted six years, two months, and three hours. As the figure of hours would be the same for all durations, it is an accurately known quantity – its inclusion in the length of marriage attests to this. The accuracy of the age, however, is called into question by the qualifier *plus minus*. Several portions of the age are

reconstructed. First, only half of the phrase *quae vixit annis* survives on the stone. *Vixit* is undoubtedly correct, as is *annis*, seeing as Caelestina was old enough to marry. Next, the *plus* in *plus minus* is interpolated, to complete the phrase. The only question here is whether it should be abbreviated to *pl(us)* to balance the *m(i)n(us)*.¹²⁸ For the figure of years, *viginti* was likely chosen for reasons of space; the precise figure is immaterial at present. *Duobus* is acceptable because no other number takes that termination. The final figure is where I take issue with the reading. Only the *S* of the unit is preserved, leaving any measure of time as an option. However, as the numeral *III* would match the terminal figure of the duration, and as the letters *HORI* would fill the lacuna just as well as *MEN*, *horis III* seems the likeliest reading.

Preliminary Conclusions

The Roman practice of recording hours on tombstones, while by no means common, was nonetheless prevalent and widespread. The nearly one thousand such inscriptions that survive in the archaeological record are no insubstantial sum. Their distribution throughout the empire argues for several areas where the practice was favored and many areas where the practice was either adopted only by a select few or was brought in by newcomers and not adopted by locals.

The origin of this practice was likely at Rome, for the practice of age recording originates there, the prevalence of inscriptions recording *horae* is highest at Rome, and the earliest securely datable examples were found there. Down along the coast from

¹²⁸ *Plus minus* is often abbreviated as *PL MN* or simply *P M*.

Rome to the Bay of Naples these inscriptions are more prevalent than in other parts of Italy, where they appear with moderate frequency. Elsewhere in Europe there is a marked thinning out in the numbers, with some provinces having no examples to their name. In North Africa there is a very high concentration in Carthage and its environs – notably, the closest port of call to Rome and doubtless well attuned to the fashions of the imperial capital. To the east, in the Asian provinces and the East African provinces there are almost no examples to speak of in Latin. This is to be expected as Greek had precedence in those regions.

Much like the geographic distribution, the temporal distribution is broad. The earliest datable examples of these inscriptions are coeval with the beginnings of the Principate. They continue through the Dominate and well into the Byzantine period in the East and the Barbarian period in the West.

Times of death and the figures of hours in durations are inextricably linked, for the former provide the numbers for the latter. Hours were used not to measure from the hour of birth, but merely to record the last fractional day lived. Thus, the fact that a string of accusatives of duration is followed by an ablative of time-when does not present a syntactic quandary, for the final figure serves both functions. The epitaphs of Blastione and Flavius Augustalis both support this trend.

Likewise the incidence of seemingly incongruous epitaphs recording ages using figures of years and hours alone likely does not represent a statistically improbable number of people dying on their birthdays – though that would have been auspicious, as epigraphic formulae attest. Rather, this is more indicative of the elderly rounding their ages, as digit grouping argues, and recording the times of their death. References to *horae*

in durations and times of death both record the same data. There are simply two different ways of expressing the information.

Chapter 2: Pagan Motivations for Recording Hours

Introduction

The quantities of hours recorded on Roman tombstones, whether written as figures in the durations of the lives of those commemorated or written as references to the hours at which those commemorated died, serve in all cases as indications of times of death. While the instances that contribute to durations can add precision (in the case of unrounded ages) and accuracy (in the case of all ages), these are generally secondary roles for their inclusion. Likewise, uses of *horae* as markers of affection, longevity, wealth, or education are generally also secondary functions. Affection may be evident in inscriptions wishing to stress the value of each moment someone very young had lived, but such an approach becomes laughable as one ages. Using hours as a marker of longevity loses its impact when one cannot actually reckon the age of the deceased. While adding more information to an inscription would have raised its cost, the use of abbreviations and the overall brevity of many inscriptions argue for frugality instead. Finally, uncertainties about ages would present an obstacle to anyone wishing to appear educated, by forcing them to record inaccurate, approximate, or fabricated data. What, then, is the primary purpose of recording hours?¹²⁹

I contend that their inclusion is evidence of broader cultural motivations, rather than individual preferences. This chapter aims to account for the practice of recording *horae* among pagans; accounting for the practice of recording *horae* among Christians

¹²⁹ Note the qualification of the secondary functions above in general terms. In approaching this corpus (or any corpus) with an eye towards interpretation, some generalizations must be made. While the interpretations advanced herein would not have served universally as motivating factors for all Romans, I offer them as being valid for the vast majority of cases. Doubtless, exceptions will arise.

will be the purview of Chapter 3. I propose that pagan Romans who recorded times of death on their grave markers did so for astrological reasons, out of a concern for the afterlife and with a view towards establishing who the tutelary of the deceased would be in the world to come.

In order to assess this matter fully, it will be necessary to gain an understanding, firstly, of the ways in which the Romans conceived of and ordered time, how this conception had developed, and how it registered in daily affairs. Then, an overview of ancient astrology will help to establish the forms commonly practiced – particularly that of genethliological horoscopy, based on the time of one's birth – the origins of these practices, and how they were perceived to hold sway over everyday life. This basis will allow for a more thorough exploration of the significance ascribed to astrological symbols; in particular, the planets and the signs of the zodiac stand out for their many reifications, being represented variously by months, limbs, aspects of one's life, and most crucially, hours. Finally, the idea of death as rebirth and the concept of tutelary divinities will be presented and it will be argued that the figures of *horae* included in epitaphs by pagan Romans functioned as the basis for horoscopes of the afterlife.

Roman Timekeeping and *Horae*

The Introduction of Hours

The origins of timekeeping at Rome – or at least of reckoning *horae inaequales*, temporal or variable-length hours – date to 263 BCE when the first sundial was brought to Rome from Catina in Sicily by Manius Valerius Messala as plunder from the First Punic War (Plin. *H.N.* 7.214). This installation would have suffered from the same

drawback as all sundials, in that it could only function insofar as atmospheric conditions were favorable; under cloud-cover or starlight estimates would have had to suffice. As it happens, accuracy could not even be guaranteed in daylight, for relocating the fixture to the north of its intended latitude has rendered its markings ever-so-slightly out of calibration for the shadows cast.¹³⁰ These problems were rectified in a sense in 159 BCE when Scipio Nasica brought the first water-clock to Rome and the measuring of *horae aequinoctes*, equinoctial or fixed-length hours, became possible (Plin., *H.N.* VII.215). Thus, neither the measuring of temporal nor equinoctial hours can be said to be a Roman innovation; both came to Rome as a function of contact with the Hellenic world.

Herodotus states authoritatively that the Greeks, too, were not the innovators of measuring the day in duodecimal divisions:

... Πόλον μὲν γὰρ καὶ γνώμονα καὶ τὰ δωδέκα μέρη τῆς ἡμέρης παρὰ Βαβυλωνίων ἔμαθον οἱ Ἕλληνες. ...

The Hellenes learned from the Babylonians of the concave sundial and the gnomon and the twelve parts of the day.

[Hdt. II.109]

This is an often misinterpreted passage, owing to the fact that Herodotus neglects to mention that the Babylonians divided the entire nychthemeron into twelve measures, each known as a *beru*, rather than just the day or the night.¹³¹ A *beru* is commonly referred to in English as a ‘double-hour’. For the idea of dividing each of the day and the night into

¹³⁰ To be precise, Gratwick (1979:319-320) calculates a disparity of up to two-and-a-half minutes owing to the shift by four degrees of latitude. In addition to this inability to indicate hours with absolute precision, the sundial was also rendered incapable of registering the solstices and equinoxes which would have marked the divisions of the seasons.

¹³¹ Breasted (1935:297) gives divisions of both the day and the night into six parts, each of which would have corresponded to two modern hours at the equinoxes. *N.B.* While factually this statement is perfectly acceptable, I am hesitant to cite Breasted’s article on account of its not infrequent Colonialist digressions.

twelve segments, the Egyptians are to thank.¹³²

As far as evidence of time measurement in Greece is concerned, Diogenes Laërtius notes that Anaximander was the first Greek to erect a gnomon and furnish markings for a sundial:

[2.1] ... *Εὗρεν δὲ καὶ γνώμονα πρῶτος καὶ ἔστησεν ἐπὶ τῶν σκιοθήρων ἐν Λακεδαίμονι, καθὰ φησι Φαβωρίνος ἐν Παντοδαπῇ ἱστορίᾳ (FHG III. 581), τροπὰς τε καὶ ἰσημερίας σημαίνοντα· καὶ ὠροσκόπια κατεσκεύασε.*

He [Anaximander] was the first who discovered the gnomon and set it upon a sundial in Lacedaemonia, as Favorinus said in his universal history: indicating both the solstices and the equinoxes; he also provided for the observation of hours.

[Diog. 2.1]

Note the word employed to describe the use of the sundial: ὠροσκόπια, coming from ὥρα. This is in contrast to that employed by Herodotus: μέρεα. In archaic and classical Greece the word ὥρα was used to denote divisions of the year, rather than those of the day – seasons, not hours. Thus, Herodotus refers to ‘parts’ of the day but has no technical term to draw upon. The lack of a specific word to denote the division of a day argues that little importance was attached to such a unit of time at this early date.¹³³ The Greek ὥρα eventually comes into Latin as *hora* and becomes the term used to refer to an hour.¹³⁴ Thus, by the late Republic, the Romans have the means to measure hours, the inclination

¹³² Hannah (2008:749). For the division of the day itself into twelve parts Breasted (1935:297) cites antecedents from Egypt in the fourth millennium. Regarding Breasted’s article *cf.* n.131.

¹³³ I offer this as a corollary to the assertion of Feeney (2010:885) that the Romans, owing to the disagreement between their calendar of 355 days and the solar year, would have placed less importance on marking the seasons (*cf.* n.130).

¹³⁴ According to Dohrn-van Rossum (1996:18) the first attested use of *hora* in this manner is coeval with the reign of Alexander the Great. Gratwick (1979:320-321) notes that ὥρα itself never took on the meaning of an hour outside of scientific contexts. Yet, I would argue that aside from technical terms such as the compound ὠροσκόπια, the word ὥρα does return to Greek even in colloquial contexts with this new Roman meaning attached to it. Epitaphs from the Roman period that record ὥραι (*cf.* n.12) surely do so in the same sense as their counterparts that record *horae*.

to do so, and a growing concern with the ordering of time within a day.

Horae in Classical Literature

Relatively speaking, *horae* receive little attention in Classical literature,¹³⁵ yet by no means should this be taken to signify that they were not a significant part of Roman life. I would argue that by virtue of being so commonplace they were more likely to have been omitted from texts; mundane details must give way to the more extraordinary. Conversely, there are contexts in which mundane details merit inclusion, for instance, Suetonius notes that Augustus would include times in his correspondence:

ad epistulas omnis horarum quoque momenta nec diei modo sed et noctis, quibus datae significarentur, addebat.¹³⁶

To all his letters he added indications of the hours – not just of the day but also of the night – by which were indicated the times at which they were sent.

[Suet., *Aug.* 50.1]

From an administrative as opposed to literary perspective, detailed factual information is crucial. Augustus, as commander-in-chief, recognized this, as did Caesar,¹³⁷ for an organized military is an effective military. Feeney notes the agency of the army in

¹³⁵ Bilfinger (1888:2); BNP *s.v.* ‘Chronography’ v.3 col.279. That is not to say that they are absent altogether. Caesar’s *commentarii*, *e.g.*, contain twenty-four references to points in time or to durations (*BG* 1.26.2, 3.5.1, 3.12.1, 3.15.5, 4.23.2, 4.23.4, 4.37.3, 5.35.5, 5.42.4, 5.46.1, 5.47.1, 5.51.2, 5.53.1, 6.35.9, 7.41.1, 7.86.4; *BC* 1.46.1; 1.47.3; 1.64.7; 1.80.3; 1.80.4; 1.82.1; 3.79.7; 3.80.7) and he is not alone in recording such information. In total there are in excess of one thousand such references in Latin literature, with Pliny the Younger (144), Cicero (117), Livy (79), and Seneca (68) contributing the greatest quantities.

It is interesting to note here that literary sources supply roughly the same number of references to *horae* as epigraphic sources. Thus, the working corpus accounts for close to half of all references to *horae* from classical antiquity.

¹³⁶ Text from PHI-L.

¹³⁷ *Cf.* n.135.

spreading the use of the calendar.¹³⁸ To this I would add the spread of the use of hours by the military, in light of the fact that the distribution of epitaphs recording *horae* in Europe is almost exclusively confined to points along the *limes*, where soldiers would have been stationed (*cf.* Figure 1).

Hours were important, too, in civil contexts rather than solely in military ones. Martial, *Ep.* 4.8, often cited as the paradigmatic description of a Roman day, is the *locus classicus* on the matter of how the Romans organized their time.¹³⁹ Here the time of day governs patron-client interactions, the sessions of the law-courts, mealtimes, and the operation of the baths.¹⁴⁰ As well, hours are noted in a decree regarding what kind of traffic may use a particular road at which times¹⁴¹ and in the logs of a postal station, indicating times of deliveries.¹⁴² These examples hint at the extent to which the reckoning of hours pervaded various aspects of Roman daily life.

The Announcement of Hours and the Quartering of the Day

Given that hours were an important measure in such a variety of contexts, it bears considering the general awareness Romans would have had of the time of day and how they would have known the hour. While sundials would measure the passing of the hours

¹³⁸ Feeney (2010:892): “Where the army went, the calendar went too.”

¹³⁹ Bilfinger (1888:118) takes issue with Martial’s descriptions, calling such a schedule ‘unmöglich’ owing to the undue amount of time dedicated to leisure. Martial, it must be remembered, was describing not the day of a common Roman, but someone of a high station.

¹⁴⁰ Indeed, baths often featured clocks to indicate when male and female bathing times were (BNP *s.v.* ‘Clocks’ v.3 col.463).

¹⁴¹ Bilfinger (1888:14) citing Zell (1874:268*ff.*).

¹⁴² Grenfell-Hunt (1906:286).

of the day and water-clocks could do likewise either for hours of the day or for hours of the night, both of these were hampered by their immobility. In order to know the time one would have had to have been in the presence of the clock. There did exist portable sundials, known as *horologia viatoria pensilia*,¹⁴³ adjustable based on latitude,¹⁴⁴ but the question remains as to how prevalent such devices were among the people. The means by which most people knew the time was likely the public announcement of hours.

The oral proclamation of time at Rome had its origins in the priestly announcement of the days.¹⁴⁵ A trend towards making more frequent announcements is evident from literature:

Horas quinque puer nondum tibi nuntiat, et tu
Iam conviva mihi, Caecilianae, venis.

*The boy has not yet announced the fifth hours to you, and you
now come, Caeciliana, my guest.*

[Martial, *Epigrams* VIII.67.1-2]

And:

... Clamore opus est, ut sentiat auris
Quem dicat venisse puer, quot nuntiet horas.

*... With a great noise is it done, that the ear perceive
the boy whom he summoned announce how many hours [it is].*

[Juv. 10.215-216]

Though these passages attest to the announcement of hours, there is some dispute over whether it was indeed every hour that was announced, or merely every third:

... XII tabulis ortus tantum et occasus nominantur, post aliquot annos adiectus est et
meridies, accenso consulum id pronuntiante, cum a curia inter Rostra et Graecostasin

¹⁴³ Mentioned, but not elaborated upon at Vitruv. 9.8.1.

¹⁴⁴ Dohrn-van Rossum (1996:21).

¹⁴⁵ Feeney (2010:884-885).

prospexisset solem; a columna Maenia ad carcerem inclinato sidere supremam pronuntiavit, ...

... *In the Twelve Tables only sunrise and sunset are named, but after some years midday was added too. It was announced by the assistant of the consul when from the Curia he looked upon the sun between the Rostra and the Graecostasis. When the sun lowered from the Maenian column to the jail he announced the final hour. ...*

[Pl., *H.N.* 7.212]

As well, Varro (*De Lingua Latina* 6.89) notes that heralds would announce noon.

Scholarly consensus seems to rest in the camp of announcing select hours, rather than all hours.¹⁴⁶ There were two types of people who would announce the time: Martial and Juvenal both seem to refer to a *horarius*, a slave who would have announced the time;¹⁴⁷ whereas Pliny and Varro refer to an *accensus*, a consul's assistant.¹⁴⁸ There is some dispute over what form the actual announcement took, whether a vocal call or a trumpet-blast.¹⁴⁹ Ultimately, all parties are in agreement that some form of public signalling of the time did occur and that this would happen at least every third hour.

This minimum level of announcement corresponds to a simplified system of timekeeping that the Romans practiced in addition to the measurement of time in hours. This secondary system divided the day into four parts instead of twelve. Though it

¹⁴⁶ *E.g.*, Bilfinger (1888:123-124); Dohrn-van Rossum (1996:19); Hannah (2008:750); Feeney (2010:885). Of note is the fact that these scholars all seem to propose announcements at the third, sixth, and ninth hours, whereas Pliny only indicates that the sixth and ninth were announced. Bilfinger, in contrast to Pliny mentions only the third hour in this context (*cf.* n.149).

¹⁴⁷ Bilfinger (1888:88).

¹⁴⁸ Feeney (2010:885). Bilfinger (1888:123-124) says rather a praetor's assistant.

¹⁴⁹ Bilfinger (1888:123-124) says that in earlier times the Praetor's officer announced *hora tertia*, but this was later signified by trumpet. Elsewhere (1888:58) he notes that *hora tertia*, *hora sexta*, and *hora nona* were at time referred to, respectively, as *prima bucina*, *secunda bucina*, and *tertia bucina*. Gratwick (1979:319) suggests "a relay of deputies in hailing-distance of one another" who would either repeat the calls or blow trumpets. Hannah (2008:750) goes with the vocal call, following Pliny and Varro. Feeney (2010:885) seems to support the vocal call, but he does bring in Gratwick's theory. *Cf.* Polybius 6.36.5 on the announcement of military night-watches by trumpet.

predated the use of hours, this quartering of the day, which had its origins in the four watches (*vigilia*) of the military,¹⁵⁰ remained in use after the introduction of hours.¹⁵¹ In time, the two systems were integrated.¹⁵² While the newer, more precise system could now be mapped onto the older divisions, the longer units of the latter were easier to estimate in the absence of a clock. The continued quartering of the day represented a means of reckoning the time when less precision was required.

Divisions of the Hour

At times – and despite claims to the contrary¹⁵³ – greater temporal precision was desired. Standard Roman unit divisions were based upon duodecimal (base-12) fractions.¹⁵⁴ The first division was the *uncia*. Thus, for example, the first-order division of a *pondus* (or *libra* or *as* or *assis*) was an *uncia*, hence pounds and ounces.¹⁵⁵ The *uncia* as a unit of time,¹⁵⁶ if taken as a measure of the hour,¹⁵⁷ yields a division of five

¹⁵⁰ Bilfinger (1888:47-49).

¹⁵¹ Dohrn-van Rossum (1996:19).

¹⁵² E.g., Hannah (2008:750-751) cites the practice of highlighting the markings of the third, sixth, and ninth hours on sundials.

¹⁵³ Cetus Faventinus (*fl.* mid-/late 3rd century CE), describing the construction of sundials in the 29th chapter of his treatise *De Diversis Fabriis Architectonicae*, notes that indications of hours suffice on the dials, as most people are too hurried to have much concern for more precise units (Pattenden 1979:204, 207-208).

¹⁵⁴ As opposed to, say, the decimal orders of magnitude employed by the metric system.

¹⁵⁵ Gandz (1952:11, 17) notes that the *agrimensores* drew parallels between the day and the *pondus*, the hour and the *uncia*.

¹⁵⁶ Bede, *De Temporum Ratione* IV gives a detailed list of the fractions of an hour: $\frac{1}{12}$ = *uncia*; $\frac{2}{12}$ = *sextans*; $\frac{3}{12}$ = *quadrans*; $\frac{4}{12}$ = *triens*; $\frac{5}{12}$ = *quincunx*; $\frac{6}{12}$ = *semis*; $\frac{7}{12}$ = *septunx*; $\frac{8}{12}$ = *bes*; $\frac{9}{12}$ = *dodrans*; $\frac{10}{12}$ = *dextans*; $\frac{11}{12}$ = *deunx*. As well, the *uncia* itself could be subdivided as follows: $\frac{1}{2}$ = *semuncia*; $\frac{1}{4}$ = *sicilicus*; $\frac{1}{6}$ = *sextula*; $\frac{1}{24}$ = *scripulum*; $\frac{1}{144}$ = *siliqua*.

minutes. The *uncia* itself was divisible into twenty-four *scripuli*, hence the now antiquated unit of the scruple. Thus, two-hundred and eighty-eight *scripuli* (of seventy-five seconds each) would comprise one hour,¹⁵⁸ provided that such fine units were indeed used in the reckoning of time.¹⁵⁹ More common fractions (e.g. *hora quarta et quadrans*, *hora quarta et triens*) are also attested in rare instances,¹⁶⁰ as are other systems of division¹⁶¹ and strictly scientific units.¹⁶² Although there were indeed many systems of dividing the hour, in practice, these would have been of little use to the average Roman and, in fact, may have been unnecessary.

¹⁵⁷ BNP (s.v. ‘Uncia’ v.15 col.100) points out that an *uncia* could also be taken as one twelfth of a day, a work-day, or a year. Two of these seem redundant, as *hora* signified the twelfth part of the day and *mensis* the twelfth part of the year.

¹⁵⁸ Gandz (1952:17) takes the *scripulum* instead as the twenty-fourth part of an hour and the two-hundred and eighty-eighth part of the day. I take issue with Gandz’s entire assessment of the *scripulum* (cf. n.159).

¹⁵⁹ BNP (s.v. ‘Scripulum’ v.13 col.124) seems to indicate that the *scripulum* – though used as a measure of currency, volume, area, and length – was not in fact used to measure time. Though Bede does refer to them as such (cf. n.156), it must be remembered that he was writing around the turn of the eighth century CE and such a usage might not have been current in the Roman period.

While CIL 09, 01513 does present the *scripulum* as a unit of time (VIXIT ANN XXI MENS III HOR IV SCRUPULOS VI), it likely does so in a display of affection rather than temporal precision. Gandz (1952:17-18) is eager to read into this inscription, using it as evidence that: “Such a scruple must have played a part in the practical life of the people and must have been indicated by the water- and sand clocks ...”. Such a definitive conclusion is entirely unjustified based on the paucity of the evidence.

¹⁶⁰ Dohrn-van Rossum (1996:20).

¹⁶¹ Bede, *De Temporum Ratione* III notes that 1 hour = 4 *puncti* = 10 *minuta* = 15 *partes* = 40 *momenta*. Another system altogether is described by O’Neil (1976:5-6): “Later in Latin the first or $\frac{1}{60}$ th fraction was referred to *pars minuta* (small part), the second or $\frac{1}{3,600}$ th fraction as *pars secunda*, the third or $\frac{1}{216,000}$ th fraction as *pars tertia* and so on.” Perhaps CIL 06, 36122 (VIX AN V MEN [. . .]X DIEB VIII HOR III MIN V) is referring to a measurement on one of these scales.

¹⁶² E.g., the monk Hrabanus Maurus of Mainz, in his *De Computo* of 820 CE gives the *scripulum* as the smallest measurable unit and the atom ($\frac{1}{22,560}$ hours) as the smallest theoretical unit of time (Borst trans. Winnard 1993:44-45). Looking to other cultures, Gandz (1952: *passim*) gives a detailed overview of Jewish and Babylonian “academic” systems of divisions.

Indications of Hours

The question of whether indications of time refer to points or ranges is the primary concern of Bilfinger's study.¹⁶³ General consensus holds that references are generally made to a duration indicated by the expiring hour (*hora expleta* or *hora completa*), except in the case of *hora prima* which can be referenced from its beginning.¹⁶⁴ The day began at dawn at the theoretical *hora 0*, had as its midpoint *hora sexta* (the sun's zenith, or ἀκριβῆς μεσημβρία) and concluded with *hora XII* at sunset.¹⁶⁵ Such a day can be represented in this manner:

Figure 6 – Representation of Hours as Fixed Points

0	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII
dawn						high noon						sunset

If a clock was marked thus, with the hours as fixed points, they would be referenced as follows:

Figure 7 – System of Referencing Hours

<u>Hour</u>	<u>Interval</u>
<i>hora prima</i>	0-I (though other terminology was generally employed; see below) I-II

¹⁶³ Bilfinger (1888: *passim*, but esp. 1-2). He is not the only scholar to investigate this matter but the issue does feature more prominently in his work than in that of others and it drives his inquiry forwards. Dohrn-van Rossum (1996:19-20) provides a brief yet thorough overview of the matter.

¹⁶⁴ Dohrn-van Rossum (1996:19) points out that *e.g. hora nona* can refer to the ninth hour of the day or the night, the quarter of the day consisting of the seventh, eighth, and ninth hours, or the terminal moment of the ninth hour.

¹⁶⁵ Bilfinger (1888: Ch. 3-4). Pattenden (1979: *passim*).

<i>hora secunda</i>	II-III
<i>hora tertia</i>	III-IV
<i>hora quarta</i>	IV-V
<i>hora quinta</i>	V-VI
<i>hora sexta</i>	VI-VII
<i>hora septima</i>	VII-VIII
<i>hora octava</i>	VIII-IX
<i>hora nona</i>	IX-X
<i>hora decima</i>	X-XI
<i>hora undecima</i>	XI-XII

However, a clock could also be marked with the hours themselves representing ranges, as such:

Figure 8 – Representation of Hours as Intervals

I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	
dawn					high noon							sunset

In this case each of the twelve hours can be referenced in turn.

In practice, *hora 0* (= *hora noctis XII*) and *hora (diei) XII* were referenced by alternate terminology, such as *mane* (dawn) and *vespera* or *suprema* (both: sunset).¹⁶⁶

Other expressions employed included:¹⁶⁷ *occasus solis* (sunset), *crepusculum* (dusk), *vesperum* (appearance of the evening star),¹⁶⁸ *conticinium* (silence), *intempustum* (complete cessation of all activities), *gallicinium* (cock's crow – just prior to dawn),

¹⁶⁶ Dohrn-van Rossum (1996:19).

¹⁶⁷ Here I follow Dohrn-van Rossum (1996:19-20) after Bede, *De Temporum Ratione* VII.

¹⁶⁸ Cf. Caes., *B.G.* 1.26.2: ... *ab hora septima ad vesperum*

aurora (waning of dark, or first dawn), *diluculum* (dawn), *exortus solis* (sunrise). On account of alternate terminology and the two means of indicating the hours, *hora XII* would have been referenced with disproportionately low frequency.

The Significance of Timekeeping in Roman Society

The Romans ascribed great importance to the ordering of the day, but to what extent did this pervade their society? Hannah proposes that, more so than literary sources, “... it is the instruments themselves that are most likely to tell us what ordinary people thought on a daily basis about time”.¹⁶⁹ To this end, he offers the distinction between the sundials at Delos, made locally and for local use, featuring accurate solstice lines, as opposed to those at Pompeii, not produced locally, and with solstice lines calibrated to their point of manufacture.¹⁷⁰ This is taken as an indication, much as in the case of Manius Valerius Messala’s sundial,¹⁷¹ that recording the major divisions of the year was in the minds of the Romans a lesser concern than the subdivisions of the day.¹⁷² More broadly, Hannah suggests a Roman penchant for the apportionment of time.¹⁷³

Feeney advances the idea of time-measurement as a defining characteristic of

¹⁶⁹ Hannah (2008:741). While this is certainly a valid suggestion, I find myself hesitant to commit to it fully. I am more of a like mind to Shaw (1984:462) in his sentiment that whereas people may be silent in the historical record “... fortunately, our tombs are not so silent.”

¹⁷⁰ Hannah (2008:750) citing Gibbs (1976:90-92).

¹⁷¹ Cf. p.60. N.B. In this case the hours were nonetheless able to be measured accurately (Hannah 2008:750).

¹⁷² Hannah (2008:750) citing Gibbs (1976:90-92).

¹⁷³ Hannah (2008:750): “Certainly we gain a distinct impression of a careful parceling out of the hours of the day among the Romans.”

Roman society:

The earliest documentable traces of a recognizably Roman culture already bear the signs of a society that is deeply invested in the semiotics and regulation of time. ... At any period of Roman history one enters, the organization of time will be found to be integral to the way the Romans represented to themselves their religion, their past, and their identity as a culture.¹⁷⁴

Although Feeney is referring primarily to the institution and eventual standardization of a single calendar, what the calendar represents for organization and administration on a large-scale, the hour can be said to represent on a more personal level. He picks up this idea, stating that:

The mid-Republican city of Rome was evidently a place where the organization of days and the demarcation of time within the day had a pervasive impact on the citizen's life.¹⁷⁵

Thus, in Rome as far back as the last centuries BCE, much as in modern society, the ordering of time was a defining factor in day-to-day affairs. This marks a departure from Greek society, where, as shown above, temporal divisions did not play so cardinal a role in daily life. This distinction is evident in the writings of Plutarch, for whom, in describing his adopted home to his countrymen, Roman conceptions of time were inseparable from an understanding of their society.¹⁷⁶

Registration of Births

In connection with *horae* in epitaphs, it bears considering other contexts in which hours would have been recorded to mark major lifecycle events. As tombstones are the

¹⁷⁴ Feeney (2010:882). Though Feeney is likely referring principally to calendars here, his ideas pertain to the measurement of hours as well.

¹⁷⁵ Feeney (2010:885).

¹⁷⁶ Feeney (2010:892). Furthermore, Feeney concludes: "What was true for Plutarch remains true for us".

primary record of death, another event in one's life should be analyzed by way of comparison. Beginning in the Augustan period, fathers were required to register the births of their children.¹⁷⁷ Registration was only performed in the case of legitimate citizen children,¹⁷⁸ the idea being to produce records for the purposes of tracing citizenship and property rights.¹⁷⁹ Births were initially recorded on temporary tablets called *kalendaria*; eventually each record would be transcribed onto a papyrus *album* for archiving.¹⁸⁰ The registration process had two components which were to be completed within thirty days of the birth: a preliminary registration immediately following the birth and a follow-up registration after the child's naming on the eighth or ninth day, as per custom.¹⁸¹ Concision was paramount and abbreviated formulae featured heavily in these records.¹⁸² While the date of birth was a required datum of each record,¹⁸³ the regimented constraints of the medium seem to have left no provision for additional information, such as the hour of birth. Thus, the recording of hours does not appear to have been a sanctioned means of commemorating a birth – or, at the very least, it was not deemed to be of censorial import. Despite the high level of time awareness in ancient Rome, hours were not recorded in an official capacity in reference to major life-cycle events. Hence,

¹⁷⁷ BNP s.v. 'Birth' v.2 col. 668. Schultz (1942:80) cites in particular the *Lex Aelia Sentia* of 4 CE and the *Lex Papia Poppaea* of 9 CE in relation to the mandating of this practice.

¹⁷⁸ Schultz (1942:81-82). The ban on illegitimate children was lifted at the end of the second century CE.

they must have filled some other role that prompted their remembering.

Astrology and Horae

Genethliology

To the Romans there was no dichotomy between the science of astronomy and the pseudoscience of astrology – the two were interdependent. The former sought to measure the heavens; the latter sought to interpret them. In a sense, astrology was an intermediary between the masses and the intricate technicalities of astronomy, translating the movements of the planets and stars into models of peoples' lives, thereby lending relevance to the cosmos. Most of those who engaged with astrological thought did so through the medium of genethliology.¹⁸⁴ This branch of astrology focuses on the ὥρα γενέθλιος (hour of birth) of the one whose fate is being told, purporting to foretell, based on the configuration of the planets and the stars at the exact time of one's birth, how his or her life would unfold.¹⁸⁵

The practice traces its origins to Babylon in the third century BCE where it developed from scientific astrology, as distinct from omen astrology.¹⁸⁶ In the second or

¹⁸⁴ Beck (2007:9). Cf. Hegedus (2007:7).

¹⁸⁵ Beck (2007:10) lists some variants on this practice, including 'general astrology' which tries to tell to fortune of a group based on the moment of its formation, and 'catarchic astrology' which works backwards, trying to determine the celestial configuration that will yield a specific result.

¹⁸⁶ Beck (2007:13-15) is careful to stress the distinction between scientific and omen astrology. In a scientific field of astrology such as genethliology, unlike an omen-based field such as augury, the interpretation is founded upon empirical observation rather than conjecture. Beck sees a class of Babylonian nonmathematical (*i.e.*, not involving calculation) astronomical texts known as diaries as the germ that would develop into genethliological horoscopy. These texts, dating to 410-69 BCE are nothing more than a record of the position of the planets at certain times. From them it would have been possible to ascertain the position of the planets at one's birth. Rochberg-Halton (1989) presents a pair of Babylonian genethliological horoscopes – out of the five that survive – which she dates to the range of 300-50 BCE.

first century BCE, by way of Egypt, genethliology made its way to Rome.¹⁸⁷ Its arrival in Rome would then have occurred around the time of the transition from Republic to Empire, coinciding with the emergence of tombstones that record hours.¹⁸⁸

Very soon after genethliology's introduction to Rome, its practitioners became embroiled in conflict. The practice was spreading, achieving popularity among the aristocracy in the first century BCE and gained a foothold among the common people in the early Imperial period.¹⁸⁹ Despite bans on forecasting durations of life or dates of death – in 11 CE Augustus outlawed such horoscopes (Cassius Dio 56.25.5) – the enterprising could readily come by such knowledge.¹⁹⁰ Astrologers were repeatedly expelled “as a sort of public cleansing of the morally undesirable”.¹⁹¹ The repeated recourse to this measure can be construed as a confirmation of the popularity both of astrology in general¹⁹² and of horoscopes concerning death.

Astrological Models

Astrologers used genethliological horoscopes to foretell future events by noting in

¹⁸⁷ Beck (2007:15-17).

¹⁸⁸ Kajanto (1963a:12) notes that only seven Latin epitaphs from the Republic record ages and that only one of those includes units finer than years. Paine-Storey (2006:93) in describing a Republican cemetery where dates of death were recorded highlights the rarity of such a practice at so early a date.

¹⁸⁹ Hegedus (2007:7).

¹⁹⁰ Beck (2007:120, 126) explains two methods commonly described in astrological manuals: the first involved adding the number of years in each part of the *dodekatropos* (cf. Figure 9); the second involved identifying the ‘birth star’ (*aphietês* = starter) and ‘death star’ (*anairêtês* = destroyer) and taking the number of degrees between them.

¹⁹¹ Beck (2007:126).

¹⁹² Hegedus (2007:8).

which ‘houses’ of the zodiac the planets were located. An example of this can be seen in a horoscope for Romulus recorded by Solinus (*fl.* late 3rd – early 4th centuries CE):¹⁹³

... Ibi Romulus mansitavit, qui auspicato murorum fundamenta iecit duodeviginti natus annos, XI k. Mai., hora post secundam ante tertiam [plenam], sicut L. Tarruntius prodidit mathematicorum nobilissimus, Ioue in piscibus, Saturno Venere Marte Mercurio in scorpione, Sole in tauro, Luna in libra constitutis.

... *There Romulus remained, who after taking the auspices set the foundations of the walls, having been born eighteen years [prior] on the ninth day before the Kalends of May, after the second hour, before the third was complete – just as Lucius Tarruntius, most renowned of astrologers reported – when Jupiter was stationed in Pisces, Saturn, Venus, Mars, and Mercury in Scorpio, the sun in Taurus, and the moon in Libra.*

[Solinus, *Polyhistor* I.18]

Here, each planet is in the domain of one sign of the Zodiac.

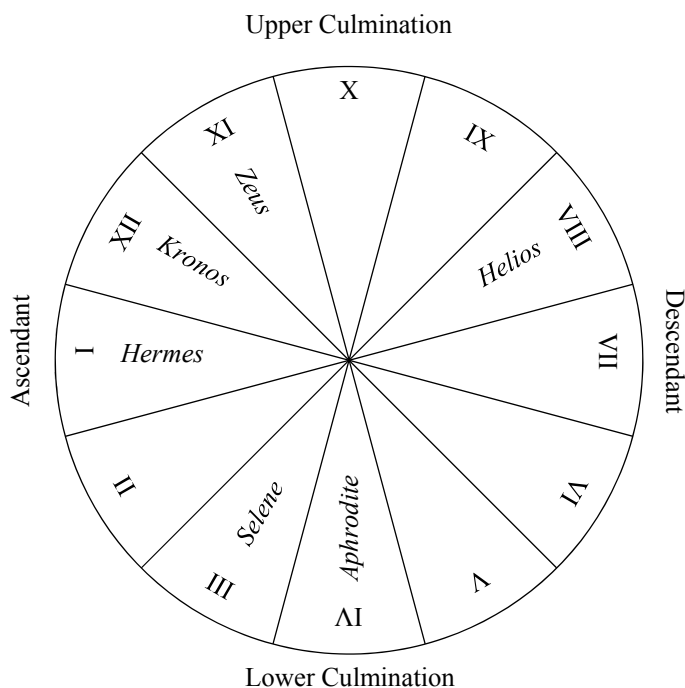

Such a calculation is based on a construct known as the *dôdekatopos* (the turning circle of the ‘twelve places’ or the Zodiac) which revolves within the *dôdekatropos* (the fixed circle of the heavens).¹⁹⁴ In Figure 9, the *dôdekatopos* is the circle in which the twelve places of *dôdekatropos* turn in a clockwise direction. During the progression through the cycle of rotation each of the twelve places will pass by each of the four cardinal points of the circle (ascendant, upper culmination, descendant, lower culmination). These points have auspicious and inauspicious connotations. The places are significant, for “... they let the astrologer resolve a person’s life into its component parts, for examples [their] marriage(s), [their] health, [their] material gains”.¹⁹⁵ However, there

¹⁹³ I offer this example in place of a true genethliological horoscope on account of its simplicity (*i.e.* to avoid being mired in technical language) and for its novelty.

¹⁹⁴ Beck (2007:42). In some cases this could be complicated by the use of *dôdekatemories* which represented the subdivision of each of the twelve places into twelve further parts, each of which was governed in turn by a sign of the Zodiac (Beck 2007:68).

¹⁹⁵ Beck (2007:42). More specifically, according to Beck (2007:48-49), this was the life of an elite male; “...astrology, at least the sort of astrology found in the handbooks, was not generally for the riff-raff”.

Figure 9 – The Planets of the *Dôdekatropos*¹⁹⁶

was no uniformly-adopted interpretation of the twelve places and taken together they formed “the most arbitrary of the major astrological constructs”.¹⁹⁷ This model broadly captures their meanings:¹⁹⁸

Table 1 – The 'Places' of the *Dôdekatropos*

<u>Place no.</u>	<u>Component of life and alternate name</u>
1	Life (in its entirety)

¹⁹⁶ After BNP *s.v.* ‘Planets’ v.11, col.331, fig.11.

¹⁹⁷ Beck (2007:43-46).

¹⁹⁸ After Beck (2007:46) Table 4.1 “The fixed circle of the twelve astrological ‘places’”. Beck, in turn, uses as his source *Catalogus Codicorum Astrologum Graecorum* v.8, part 3, p.116, 1.32-p.117, 1.26.

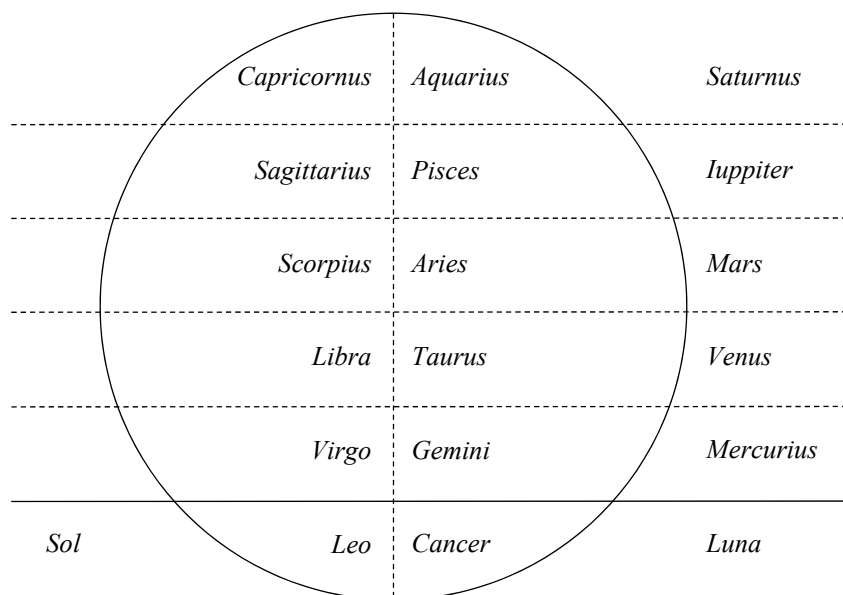

- 2 Gain (material prosperity); Gate of the Underworld
- 3 Brothers (siblings and relatives other than parents and children);
Goddess (*i.e.* the Moon)
- 4 Parents (and patrimony)
- 5 Children; Good Fortune
- 6 Illness; Bad Fortune
- 7 Marriage
- 8 Death
- 9 Travel (and living abroad); God (*i.e.* the Sun)
- 10 Honors (and activities)
- 11 Friends; Good Daemon
- 12 Enemies; Bad Daemon

As can be seen, some places were more desirable than others.¹⁹⁹

Regarding the significance of hours, the problem here is that there are only seven planets, yet twelve signs of the Zodiac. The question is one of how to distribute these twelve among the seven. Figure 10 shows a system, known at the *heptazonos*, in which the sun and the moon each govern one sign of the Zodiac, while the remainder of the planets rule over two apiece. In this model, the doubling up of assignments serves to reconcile the disparity between the seven planets and the twelve signs of the Zodiac.

¹⁹⁹ Dorotheus of Sidon (*fl.* mid 1st CE) ranked them from best to worst, with seven having favorable connotations and five being unfavorable: Good – 1, 10, 11, 5, 7, 4, 9 – Neutral – 2, 3, 8, 6, 12 – Bad (Beck 2007:46).

Figure 10 – Heptazonos of the Planet Houses²⁰⁰

Planetary Hours and the Planetary Week

In addition to governing the heavens, the planets could serve as *chronocrators*, ruling over years, months, days, and hours.²⁰¹ The issue is how to apportion the hours amongst the planets – here again, the matter of distributing seven among twelve comes into play. The solution comes by using not merely the hours of one day, but those of an entire week. Again, difficulty arises, for the duration of a week must be defined.

Whereas in modern Western society, it is assumed that seven days comprise one week, such was not always the case. Though the idea of a ten-day week brings to mind the eccentricities of the French Revolutionary calendar and its concomitant nychthemeron of ten ‘hours’, a week of such length was known to the Romans, and was in use for a time

²⁰⁰ After BNP s.v. ‘Planets’ v.11, col.330, fig.9.

²⁰¹ BNP s.v. ‘Planets’ v.11, col.332.

alongside cycles of eight and seven days,²⁰² with the latter two coexisting as early as the late republic.²⁰³ While the eight-day *nundial* cycle was structured around the *nundinum*, the market-day that fell every eighth day²⁰⁴ and which established a framework for daily affairs, the seven-day ‘planetary’ cycle filled a far less practical role – though one no less important for someone superstitious.

In the system of planetary hours, the hours receive astrological associations. The days of the planetary week take their original names (*diei Mercurii, Veneris, Martis, Iovis, Saturni, Solis, Lunae*) from the seven planets (Mercury, Venus, Mars, Jupiter, Saturn, the sun, and the moon). These names originate in the late republic or early empire, making their introduction contemporary with the first epitaphs recording *horae*.²⁰⁵ Curiously, there is no logical way – whether by size or period of orbit or some other measure – to rank the planets so as to arrange them in the order presented by the days of the week (*diei Solis, Lunae, Martis, Mercurii, Iovis, Veneris, Saturni*); this comes about only through the assignation of the planets to the hours of the day. Cassius Dio explains the process:

[37.18.1] τὸ δὲ δὴ ἐς τοὺς ἀστέρας τοὺς ἐπὶ τὰς πλάνητας ὀνομασμένους τὰς ἡμέρας ἀνακεῖσθαι κατέστη μὲν ὑπ’ Αἰγυπτίων, ... οἱ γοῦν ἀρχαῖοι Ἕλληνες οὐδαμῆ αὐτό, ὅσα γε ἐμὲ εἰδέναι, ἠπίσταντο. [2] ἀλλ’ ἐπειδὴ καὶ πάνν νῦν τοῖς τε ἄλλοις ἅπασιν καὶ αὐτοῖς τοῖς Ῥωμαίοις ἐπιχωριάζει, ... βραχὺ τι περὶ αὐτοῦ διαλεχθῆναι βούλομαι, πῶς τε καὶ τίνα τρόπον οὕτω τέτακται. ἤκουσα δὲ δύο λόγους ... [37.19.1] ... ἕτερος δὲ ὅδε. τὰς ὥρας τῆς

²⁰² Salzman (2004:185) in describing the Codex Calendar of 354 CE, the only calendar to survive from the fourth century, explains that it made provisions for the measurement of time on the ten-day lunar week, the eight-day Roman market week, and the seven day planetary week.

²⁰³ Salzman (2004:188-190). He astutely illustrates this by referring to the grave of Blastione (*cf.* pp. 53 which employs the *nundial* cycle for dates, but the planetary cycle for days of the week.

²⁰⁴ Or every ninth day by inclusive Roman counting.

²⁰⁵ O’Neil (1976:6). Salzman (2004:188) traces the concept back to Alexandria in the second century BCE.

ἡμέρας καὶ τῆς νυκτὸς ἀπὸ τῆς πρώτης ἀρξάμενος ἀριθμεῖν, καὶ ἐκείνην μὲν τῷ Κρόνῳ διδούς, τὴν δὲ ἔπειτα τῷ Διὶ καὶ τρίτην Ἄρει, τετάρτην ἡλίῳ, πέμπτην Ἀφροδίτῃ, ἕκτην Ἑρμῇ καὶ ἑβδόμην σελήνῃ, [2] κατὰ τὴν τάξιν τῶν κύκλων καθ' ἣν οἱ Αἰγύπτιοι αὐτὴν νομίζουσι, καὶ τοῦτο καὶ αὐθις ποιήσας, πάσας τε οὕτω τὰς τέσσαρας καὶ εἴκοσιν ὥρας περιελθὼν, εὐρήσεις τὴν πρώτην τῆς ἐπιούσης ἡμέρας ὥραν ἐς τὸν ἥλιον ἀφικνουμένην. [3] καὶ τοῦτο καὶ ἐπ' ἐκείνων τῶν τεσσάρων καὶ εἴκοσιν ὥρων κατὰ τὸν αὐτὸν τοῖς πρόσθε λόγον πράξας, τῇ σελήνῃ τὴν πρώτην τῆς τρίτης ἡμέρας ὥραν ἀναθήσεις, κἄν οὕτω καὶ διὰ τῶν λοιπῶν πορεύῃ, τὸν προσήκοντα ἑαυτῇ θεὸν ἐκάστη ἡμέρα λήψεται.

[37.18.1] *Indeed the Egyptians established the ascribing of the days of the weeks to the seven stars called planets ... In any event, as it appears to me, the old Greeks didn't understand it. [2] But since right now it is the custom both for the others and for the Romans themselves ... I wish to say something brief concerning it [namely], how and in what manner it is arranged in this way. I have heard two explanations ... [37.19.1] ... this is the second. Beginning to enumerate the hours of the day and the night from the first [hour], giving that one to Kronos, the next to Zeus and the third to Ares, the fourth to the sun, the fifth to Aphrodite, the sixth to Hermes and the seventh to the moon, [2] according to the order of the orbits according to which order the Egyptians have as a custom, and also having done this again, and in this manner going about all the twenty-four hours, you will find that at the first hour of the day at hand the sun is called upon. [3] And doing this also for each of these twenty-four hours according to the very reasoning as before, you will give the first hour of the third day to the moon, and if you were also to proceed in the manner through the rest, each god will claim the appropriate day for him- or herself.*

[Cassius Dio 37.18.1-37.19.3]

The Egyptian taxonomy of orbits that Cassius Dio cites (τὴν τάξιν τῶν κύκλων καθ' ἣν οἱ Αἰγύπτιοι αὐτὴν νομίζουσι)²⁰⁶ refers to the ordering of the planets in terms of decreasing sidereal period,²⁰⁷ *i.e.* the time it takes a body to complete an orbit using as a frame of reference observations against fixed stars,²⁰⁸ and provides the ranking: Saturn, Jupiter, Mars, sun, Venus, Mercury, moon. Assigning each in turn to hours of the day and night yields an arrangement whereby the planet assigned to the first hour of a day governs that

²⁰⁶ O'Neil (1976:37) disputes the Egyptian origin of this practice, arguing instead for Hellenistic or Babylonian origins, possibly by way of Egypt.

²⁰⁷ O'Neil (1976:37).

²⁰⁸ This differs from the time it takes one heavenly body, such as the moon, to orbit another, such as the earth.

day. The ordering is as follows:

Table 2 – Planetary Hours and the Planetary Week

<u>Hour</u>	<u><i>Saturnis</i></u>	<u><i>Solis</i></u>	<u><i>Lunae</i></u>	<u><i>Martis</i></u>	<u><i>Mercurii</i></u>	<u><i>Iovis</i></u>	<u><i>Veneris</i></u>
1	Saturn	Sun	Moon	Mars	Mercury	Jupiter	Venus
2	Jupiter	Venus	Saturn	Sun	Moon	Mars	Mercury
3	Mars	Mercury	Jupiter	Venus	Saturn	Sun	Moon
4	Sun	Moon	Mars	Mercury	Jupiter	Venus	Saturn
5	Venus	Saturn	Sun	Moon	Mars	Mercury	Jupiter
6	Mercury	Jupiter	Venus	Saturn	Sun	Moon	Mars
7	Moon	Mars	Mercury	Jupiter	Venus	Saturn	Sun
8	Saturn	Sun	Moon	Mars	Mercury	Jupiter	Venus
9	Jupiter	Venus	Saturn	Sun	Moon	Mars	Mercury

On this basis each of the hours on tombstones can be said to correspond with one of the seven planets. Two problems arise: Firstly, this system depends on a cycle of twenty-four hours rather than two cycles of twelve hours.²⁰⁹ This is easily remedied by beginning the day at sunrise and splitting the twenty-four hours into twelve hours of the day and twelve

²⁰⁹ O’Neil (1976:37-38) points out that as this system presupposes a 24-hour cycle, it would not have worked with the twelve-*beru* Babylonian system.

of the night. The issue now is that without knowing the day of the week it is impossible to know which planet is assigned to an hour – it is not even possible to narrow down the number of possibilities from seven, as in the course of the 168 hours of the week each planet governs each hour exactly once. Unless someone setting up an epitaph chose to include a day of the week along with the hour – and almost no one chose to do so – the figures are altogether unsuited for interpretation on a system of planetary hours.

Iatromathematics

Genethliological horoscopes were not used simply as speculative tools. They could also influence someone's life more directly. Notably, the Hellenistic-Egyptian field of iatromathematics (ιατρομαθηματικά), through a process of melothesia, which in one manifestation correlated the signs of the zodiac with the limbs of the body, sought to diagnose, prevent, or treat afflictions based upon the heavenly configurations at the patient's birth.²¹⁰ Though what each sign of the zodiac represented was not codified,

Marcus Manilius' *Astronomica* presents an example of melothesia:

Accipe divisas hominis per sidera partes
 singulaque imperiis propriis parentia membra,
 455 in quis praecipuas toto de corpore vires
 exercent. Aries caput est ante omnia princeps
 sortitus censusque sui pulcherrima colla
 Taurus, et in Geminis aequali bracchia sorte
 scribuntur conexa umeris, pectusque locatum
 460 sub Cancro est, laterum regnum scapulaeque Leonis,
 Virginis in propriam descendunt ilia sortem,
 Libra regit clunes, et Scorpios inguine gaudet,
 Centauro femina accedunt, Capricornus utrisque
 imperitat genibus, crurum fundentis Aquari
 465 arbitrium est, Piscesque pedum sibi iura reposcunt.

²¹⁰ BNP s.v. 'Iatromathematics' v.6 col.690-691.

*Observe how you may apportion the parts of a man through the stars
the individual limbs submitting to personal authorities,
in which they oversee particular forces from the entire
body. Aries is the head – the first allotted – before
all, and Taurus is distinguished by his finest
neck, and to Gemini by equal lot the arms joined
to the shoulders are ascribed, and the breast is
situated beneath Cancer, the flanks and the back are the domain of Leo,
the abdomen falls in the particular lot of Virgo,
Libra governs the buttocks, and does the groin not delight Scorpio?
the thighs fall to Sagittarius, Capricorn rules
either of the knees, of flowing Aquarius is mastery
of the shins, and Pisces demands of the feet oaths to himself.*

[Astronomica 2.453-465]

An assignation such as this shows how each sign of the Zodiac could be said to govern part of the body.²¹¹ Based on a patient's genethliological horoscope, the locations of the planets in the twelve houses of the Zodiac could designate certain years, months, days, or hours as dangerous or lethal for the patient.²¹² For present purposes, it is important to note regarding iatromathematics that: it demonstrates that the signs of the Zodiac were indeed mapped onto dodecamerous systems (*i.e.* twelve-part); that it hints at correlations between heavenly configurations and temporal units such as hours; and that its origins in Hellenistic Egypt point to its introduction in Rome in the late Republic or early Principate.

Interpretation of the Epitaphs

The Pagan Roman Milieu

Building upon the above overviews on time and astrology in pagan Rome, I wish

²¹¹ Beck (2007:69) refers to this arrangement with Aries assigned to the head and so on down to Pisces for the feet as “customary”.

²¹² BNP s.v. ‘Iatromathematics’ v.6 col.691.

to advance an interpretation of the figures of *horae* recorded on pagan epitaphs. As demonstrated, the hour of the day was publically known, either on account of instruments of measurement, or through the agency of hourly or quarterly announcements. In the case of quarterly announcements, a rough estimate could be made as to the particular hour. Although public records of birth were kept, these did not include the time at which the births occurred; such information, however, was the foundation of genethliological horoscopy. The practice of casting one's fortunes in life as a function of the astral and planetary configurations at the hour of one's birth attests to the conflation of temporal and astronomical thought. Models such as the *dodekatopos*, the *heptazonos*, and the planetary week are evidence of a desire to correlate the seven planets with dodecamerous divisions. Iatromathematics shows that such concerns were not relegated to the realm of astrology, but were manifest in other aspects of life. It is only with an understanding of pagan Rome in these terms that it is possible to interpret the *horae*.

Both time measurement and scientific astrology come to Rome by way of interactions with the Hellenistic world in the late Republic. By necessity in the case of the former, this is just prior to the emergence of epitaphs recording *horae* in the epigraphic record. It is in these epitaphs that the Roman penchant for the apportionment of time, the populace's illicit hunger for astrological divination, and the Roman conception of death as rebirth into another realm coalesce into a genethliological horoscope of the deceased. Thus, the times captured in the figures on these inscriptions mark a transition, denoting both the terminal point of life in the mortal world and the incipient moment of the afterlife.

Tutelars and Rebirth

A pair of inscribed quadrangular pillars from Rome (*cf.* Appendix V), the *Menologium rusticum Colotianum*²¹³ and the *Menologium rusticum Vallense*,²¹⁴ each present an almanac of agricultural, astrological, and religious data. Both record roughly the same text, presenting in twelve columns (three per side), notable information about each month of the year. Each column is crowned with a depiction of a sign of the Zodiac, beneath which the month is named, its length in days is given, the date on which the *Nonas* falls is indicated, the average length of the day and the night are reckoned in terms of equinoctial hours, the dates of the equinoxes or solstices are included where applicable, the house of the *dodecatopos* where the sun will be is referenced by its corresponding sign of the Zodiac (the same that tops the column), agricultural tasks to be completed are enumerated, festivals are listed, and, most crucially, the tutelary divinity of the month is identified. A summary of the sun's position and the tutelars is as follows:

Table 3 – Tutelars by Month

<u>Month</u>	<u>Sun's 'House'</u>	<u>Tutelar</u>
January	Capricorn	Juno
February	Aquarius	Neptune
March	Pisces	Minerva
April	Aries	Venus
May	Taurus	Apollo
June	Gemini	Mercury
July	Cancer	Jupiter
August	Leo	Ceres

²¹³ CIL 06, 02305 = CIL 06, 32503 = CIL 01, p 0280 = InscrIt-13-02, 00047 = ILMN-01, 00064 = D 08745 = RICIS-02, 00501/0219.

²¹⁴ CIL 06, 02306 = CIL 06, 32504 = CIL 01, p 0280 = InscrIt-13-02, 00048 = AE 2004, +00011.

September	Virgo	Vulcan
October	Libra	Mars
November	Scorpio	Diana
December	Sagittarius	Vesta

Each month is paired with one sign of the Zodiac and one god of the pantheon. Unlike in the *heptazonos*, here there is a one-to-one correspondence between the twelve months and the twelve houses or the twelve gods. In contrast to the system of planetary hours where both the hour and the day must be known, here only one piece of information is necessary, meaning the pairings remain valid in any year. Most important is the role in which the gods feature. Each is called *tutela* – one who watches, one who cares for, one who protects. In a sense, to each god is assigned the *provincia* of one month of the year.

I propose that the references to *horae* in epitaphs represent a transposition of such an assignment of tutelars to a cycle of twelve hours, rather than twelve months. Although such a system is unattested in the pagan period, I base this off a later and attested Christian practice (to be discussed in Chapter 3) which I argue belongs to a tradition of the Christianization of pagan practices. Thus, based on the reference to an hour alone, *i.e.*, without a day of the week recorded, it would be possible to know which deity would serve as guide and protector of the deceased in the world to come. Much as Augustus is depicted on the Gemma Augustea under the tutelage of Capricorn,²¹⁵ so too do these grave markers place the deceased in the care of higher powers.

²¹⁵ Housman (1913:109-111) notes that although Augustus was born under Libra, there is some evidence for an alternate system of assigning birth signs. Rome is sometimes referred to as having been established under Libra, owing to the fact that the moon was in the house of Libra at the time. The moon would have been in Capricorn at the time of Augustus' birth, and hence, both Libra and Capricorn could plausibly be invoked as his birth sign.

Conclusions

Around the transition from Republic to Empire, Romans developed an increasing awareness of time. Contact with the Hellenistic east led to an importation not merely of the finest artifacts, but also the finest scientific ideas and technology to the city of Rome, to Italy, and to the provinces. This was the catalyst which prompted Romans to become increasingly concerned with organizing their daily lives according to the clock. At the same time Romans also developed a great interest in horoscopy, as evidenced by the measures taken to stem the influence of the astronomers and to stymie the practice of their trade. The trend towards correlating the movements of the planets and the Zodiac with more worldly matters can be seen in practices such as iatromathematics. By the first century BCE Romans were measuring time in hours, keeping registers of births, measuring lifespans, predicting their futures based on the arrangements of the stars and planets at their births, and, most of all, setting up inscribed epitaphs. It is in this climate that the practice of recording hours at death emerged as a product of the prevailing epigraphic habit, increasing temporal awareness, and the concurrent astrological fascination that developed.

Somewhat counterintuitively, it is not the numbers themselves that are significant, but the deity that each represents. The distributions of the figures (*cf.* Figure 3) is relatively even, and anomalies are a function of different systems of indicating times: the prevalence of threes and sixes is a result of the quartering of the day, the underrepresentation of ones and twelves is a product of different means of marking clocks and alternate, non-numerical terminology used to refer to dawn and sunset.

The act of recording hours of death reflects a belief in the afterlife and a desire to

ensure that loved ones will be cared for in their new realm. In particular, inscriptions recording only years and hours demonstrate a significance ascribed to hours unrelated to the desire for precision in age recording. A correspondence to tutelary divinities can be seen by reading these hours with an eye towards astrological thought and by viewing them in light of the *menologia*. Hence, recording the hour at death serves to indicate the tutelar who will lead and defend the deceased upon their rebirth in the kingdom of Hades.

Chapter 3: Christian Motivations for Recording Hours

Introduction

Chapter 1 has demonstrated that in all cases the figures of hours recorded on Roman grave markers serve as indications of time of death. Chapter 2 has argued that among pagans these references functioned both as the basis for horoscopes of the afterlife and as a means to denote the tutelary of the deceased in the afterlife. This chapter will account for the continuance of this practice among Christians and will establish what it represented to them. I contend that both the pagan and Christian inscriptions were similar in intention, yet their connotations were keyed to the tenets of the respective creeds.

In order to understand how Christians come to adopt this practice, it will be necessary to begin with a broad outlook, considering first trends in the epigraphic and epitaphic habits and the idea of Christianization in general. From this understanding, attention will move to the Christian adoption of the Roman units of time. This will lead into a discussion of the ways in which Christian concepts were mapped onto the twelve hours. Finally, attempts to integrate astrological models and Christian theology will be analyzed, with specific reference to genethliological horoscopy and tutelarys of the afterlife. Ultimately, it is my goal to prove that the Christian epitaphs in the sample evince a syncretism, whereby the twelve apostles were substituted in place of the signs of the Zodiac or the gods of the pantheon in the roles of *chronocrators* and tutelarys.²¹⁶

²¹⁶ While scholars such as Danéliou (1963) and Hegedus (2007) have described this Christianization of the Zodiac and the pantheon, none have connected these to epitaphic practices. However, the fact that such associations are well attested will serve to bolster my theories.

Christianization

Written records of Christian practice, which appear with great prominence beginning in the latter half of the fourth century CE, evidence not the outright rejection of earlier customs, but a more incremental development.²¹⁷ The two traditions did not exist in isolation; rather their relationship was almost symbiotic in nature, with Christian practice developing both in response to and in imitation of pagan tradition.²¹⁸

Canonical Hours

The Canonical Hours, the standard prayer-times of the Church, provide an example of the integration of Roman and Christian concepts. While there were regional variations, especially concerning the liturgy,²¹⁹ the overall framework of the prayers achieved a measure of consistency. Prayers were said at dawn (*ad matutinam, laudes matutinales*) and sunset (*ad vespervas*), morning (*ad primam*) and night (*ad completorium*), and throughout the day (*ad tertiam, ad sextam, ad nonam*).²²⁰ In time, the dawn and pre-dawn prayers were merged to yield an order of seven offices: *matins/lauds*,

²¹⁷ Taft (1986:31-32). This appearance of evidence in the second half of the fourth century CE accords well with Galvao-Sobrinho's (1995) model of the development of the Christian epigraphic habit, whereby the epigraphic record begins to reflect the ascendancy of Christianity about a generation after Constantine's Edict of Toleration.

²¹⁸ Hegedus (2007:373).

²¹⁹ For an overview of the liturgical aspects of the hours and their regional diachronic developments see Taft (1986), whose account is meticulous and thorough. Remarkably it is not exhaustive, in reflection of myriad variations attested.

²²⁰ Van Dijk-Walker (1960:15-16). This arrangement developed over a period of centuries, first in monastic circles, and was not fully adopted in public circles until as late as the sixth century (van Dijk-Walker 1960:17).

*prime, terce, sext, none, vespers, and compline.*²²¹ Though the idea of prayers at set times is a borrowing from Jewish tradition, it is doubtful that this accounts for the specific times chosen.²²² In particular, the offices of *terce, sext, and none* mirror the standard Roman divisions for the quarters of the day at the third, sixth, and ninth hours. Thus, in this arrangement, borrowings both from the dominant monotheistic (Jewish) and cultural (Greco-Roman) antecedents of Christianity are evident.

The vast majority of references to points in time in the New Testament are to the third, sixth, and ninth hours. In both the Gospels and the Acts of the Apostles these times feature, including in reference to prayer, but it is doubtful that they indicate the codification of prayer times at so early a date.²²³ Rather, it seems that these indications of time are used in place of more precise figures of hours for the same reason that they would have been employed by pagan Romans, namely, that they offered a convenient way to divide the day while still offering a basic level of temporal distinction (*e.g.* Mark 15:25, 33). Likewise, the other terms used in the demarcation of prayer times reflect common practices in time indications, such as referring to the dawn and the evening.

The knowledge that these times held special significance for Christians is crucial in accounting for the distribution of the figures of hours (*cf.* Figure 3). Much as among pagans, Christians too would have referred to the third and sixth hours with greater frequency, owing to their presence both in the standard system of twelve hours and in the system of Canonical hours. Likewise, the fact that dawn and dusk were prayer times

²²¹ Van Dijk-Walker (1960:16) calls seven a more ‘ideal’ number.

²²² Taft (1986:5-10).

²²³ Metzger (1997:28); Taft (1986:19).

suggests that the twelfth hour would have been referenced less frequently.²²⁴

Though founded upon standard systems of Roman time measurement, the Canonical Hours take on religious significance. Paradigmatically, the connotations of the evening and morning hours are paschal in nature, presenting the themes of dying and rising; the nighttime hours convey an eschatological message of resurrection and the second coming; while the daytime hours relate the episodes from the Passion that occurred at the third, sixth, and ninth hours, respectively.²²⁵ Thus, the development of the Divine Office perfectly encapsulates the process of Christianization.

The Epigraphic Habit

In inscriptions, too, a Christianizing trend is evident. Galvao-Sobrinho sees the revival of the epigraphic habit as a direct consequence of the spread of Christianity, yet, in contrast to the multifarious nature of the earlier tradition, the Christian habit displays a preference for epitaphs to the exclusion of almost all other categories of inscriptions.²²⁶ This practice expands as conversions increase and death takes on greater religious significance.²²⁷ It must be remembered that any rise in epigraphic production is a reflection primarily of a mounting commemorative tradition.²²⁸

Understanding why Christians set up epitaphs is a fundamental question to

²²⁴ This does not account for the first hour, however, owing to the prayers of *prime*.

²²⁵ Taft (1986:25).

²²⁶ Galvao-Sobrinho (1995:437). He also notes that the material has resisted historical analysis, despite being “embarrassingly vast” (434-5; 437).

²²⁷ Galvao-Sobrinho (1995:461).

²²⁸ Galvao-Sobrinho (1995:447).

address in studying the process of Christianization.²²⁹ While little is known about the reasons why Christians would commemorate their dead, the preponderance of epitaphs suggest that they possessed a strong desire to do so.²³⁰ Keeping to a particular subset of epitaphs, Chapter 2 offered pagan motivation for recording hours. This chapter accounts for the Christianization of the pagan practice of recording hours and in so doing accounts for why certain Christians (but certainly not the majority) set up epitaphs.

The trends towards simplicity and brevity in Christian inscriptions may be a reflection not of poverty, but of modesty.²³¹ Then again, it could also be a function of low levels of literacy, or merely a realization that the dead themselves had little need of long commemorative texts.²³² The commemorators in this period are more aptly characterized as “humbler” than those in earlier periods.²³³

Whereas in the Principate there had been an epigraphic trend to maintain a certain ‘Roman’ aesthetic, alternate considerations motivate the erection of epitaphs in the Dominate as form gives way to function.²³⁴ Death in Christianity came to represent a rebirth into an eternal life.²³⁵ While the recording of ages on tombstones was prompted by astrological, judicial, or religious reasons, dates of birth and death were recorded in

²²⁹ Galvao-Sobrinho (1995:437).

celebration of anniversaries.²³⁶ It is in this tradition that I situate times of death.

Galvao-Sobrinho argues that resurrection and the afterlife are the key to understanding Christian epitaphs, in that the epitaphs served as a way to mark the deceased as Christian, which in turn would identify them as such on the day of judgement and guarantee them salvation.²³⁷ Despite the fact that many did not fully accept these ideas or were unsure of what would happen after their deaths, they adhered to these practices all the same, erring on the side of caution, and left in stone immutable testimony to their faith.²³⁸ Epitaphs recording *horae* fit well within this model, demonstrating a concern for the afterlife and anxiety regarding the eschatological journey. Galvao-Sobrinho further suggests that epitaphs were a unifying medium for the disparate sects of Christianity and that they were not the place to assert the contentious beliefs of individual groups.²³⁹ Yet here I disagree, for if the recording of hours does indeed point to the intermixing of astrology and Church doctrine, then, given the resistance to such syncretism by various elements of the Church, it would stand to reason that this was not a universal practice and, hence, one only practiced by certain sects. Instead, the recording of hours could serve as an inconspicuous means to identify sectarian affiliation.

²³⁶ Calabi Limentani (1968:171).

²³⁷ Galvao-Sobrinho (1995:452-454; 453 n.97).

²³⁸ Galvao-Sobrinho (1995:454-457). The intention was to single themselves out from amongst the other groups that would not achieve salvation.

²³⁹ Galvao-Sobrinho (1995:457 n.113).

Christianity and Astrology

Despite the continued popularity of astrology among the masses even after the ascendancy of Christianity, it remained at conflict with Church doctrine, offering a challenge to the ideas of human freewill and a transcendent god who served as the lone creator of the universe.²⁴⁰ Whether or not astrology was sanctioned is irrelevant; what matters is whether it was practiced – which it most certainly was, objections notwithstanding.²⁴¹

It could be that Christians continued this astrological tradition to show their triumph over it. The resurrection of Jesus had defied the rules of astrological fate; baptism served as a reflection of this fact.²⁴² In this sense they record the hour of death in mockery of their allotted time and their prescribed fate with the knowledge that their baptism has divorced them from the constraints of fate and granted them eternal life. Thus, in death they defy astrological fate and through baptism they are released from it. The hour of death serves as a basis for a horoscope reflecting on life as well as the genethliological horoscope of their new life. Yet, it could be that they maintain this pagan tradition simply because it was an accepted standard form. Hegedus, offering ILCV 4377 (*cf.* Appendix IV) and ILCV 4379, both of which present horoscopes for Christian

²⁴⁰ Hegedus (2007:9-12; 184-185).

²⁴¹ Hegedus (2007:25) summarizes the main refutations of astrology: (1) that a horoscope could never be truly accurate, owing to the impossibility of registering the heavenly configuration at the exact moment of birth instead of at a moment after a brief delay of recognition; (2) that those with the same horoscopes were able to live different lives; (3) that those with similar lives may have had different horoscopes; (4) that the existence of societal traits contradicts that idea of complete individuality; (5) that animals, though subject to horoscopy, do not live similar lives to humans; (6) that a belief in fate obviates the need to adhere to moral obligations.

²⁴² Hegedus (2007:198).

deceased, as examples of epitaphs that blend Christian and pagan signifiers, argues that such inscriptions use astrological language in adherence to epitaphic norms, rather than in acceptance of horoscopic divination.²⁴³

The Planetary Week

Much as the apportionment of time helped to define Roman culture, for Christians, too, times could aid in the establishment of a common identity.²⁴⁴ In the fourth century CE both pagans and Christians – a large number of whom had until recently been pagans or maintained the appearance of being pagans – conceived of time in the same manner as pagans and were cognizant of the same astrological associations that were made by pagans to units of time.²⁴⁵ Whether or not they truly accepted this secondary meaning is of little importance; their awareness is the key issue. Yet those who saw the appeal of astrology were the very same people who would have developed an interest in Christianity.²⁴⁶ Thus, the process whereby the planetary week became a standard means of reckoning time for Christians began as a way for them to maintain continuity with pagan society and only gradually integrated a theological layer.²⁴⁷

This development was characteristic of the process of Christianization in general,

²⁴³ Hegedus (2007:197). Nordberg (1963:53) too points to the presence of astrological signifiers in Christian inscriptions.

²⁴⁴ Salzman (2004:186).

²⁴⁵ Salzman (2004:207).

²⁴⁶ O'Neil (1976:38).

²⁴⁷ Salzman (2004:207-208).

taking existing systems and incorporating a new Christian dimension.²⁴⁸ When on March 3, 321 CE Constantine officially adopted the planetary week as the basic structure of day-to-day life in place of the nundial cycle, it was apparent that he did so to court favour with the Christian community.²⁴⁹ Changing the first day of the week from Saturday to Sunday, which stood in for Jesus by metonymic association, cemented this notion.²⁵⁰

Not all Christians in the fourth century took to this widespread use of the planetary week, fearing both that the days could not be disassociated from their astrological origins and that the use of such identifiers presupposed an agency on the part of the planets in determining the course of an individual's daily affairs.²⁵¹ That Christians in rare cases recorded the day of the week on which someone had died has been taken as evidence of the continued belief that the planet governing the day of death would exert influence over the deceased in the afterlife.²⁵² This is in contrast to the recording simply of the *date* of death (or burial), which had theological (rather than astrological) significance and functioned as a marker of the day of one's rebirth.²⁵³ Yet I disagree with the argument that including the day of the week would add purely astrological connotations. Rather, I see this as a way of reconciling earlier astrological practice with

²⁴⁸ Salzman (2004:186).

²⁴⁹ O'Neil (1976:38-39). *Cf. Codex Theodosii* 2.8.1.

²⁵⁰ O'Neil (1976:38-39). As Sunday marks the beginning of the Jewish week, Christians would have been using this system already; Constantine merely legitimized the practice. Yet, as Salzman (2004:186) observes, this shift could have been a sly way to cover his bases and win over various groups within his empire, for worshippers of Sol Invictus and Mithras would have been reverent of the sun as well.

²⁵¹ Salzman (2004:192-194).

²⁵² Salzman (2004:205) citing Schürer (1905).

newly-developing religious ideas.

Interpretations of the Twelve Hours

Owing to the conflict between those in favor of and those opposed to integrating astrological notions into Christian practice, it comes as no surprise to learn that some of those who were the most adamant advocates for astrology were disavowed by the Church. Several of the astrological constructs discussed in Chapter 2 are adopted by these sects and discussed in their writings. While looking to these groups will by necessity reveal an above-average level of integration of astrology into Christian practice, it nevertheless provides a sense of the ways in which Church doctrine and pagan traditions could be combined. From these excessively astrological examples, it can be argued that astrological elements would have pervaded common practice, albeit to a lesser extent. These groups merely took things too far.

The Priscillianist view, *i.e.* that espoused by Priscillian (Spanish; *fl.* late 4th century CE),²⁵⁴ was notable for being particularly intertwined with astrology.²⁵⁵ One example of this is the way in which the principle of melothesia, which made possible the associations of limbs and organs with the signs of the Zodiac, was used to confer

²⁵⁴ BNP Online *s.v.* ‘Priscillianus, Priscillianism’ points out that while there never was an actual Priscillianist sect, Priscillian’s views did gain a loyal audience and maintained their currency until at least the late 6th century CE. Hegedus (2007:345 n.1) adds that it is not possible to separate the views of Priscillian himself from those of his followers.

²⁵⁵ Hegedus (2007:345): “... it was not merely the Priscillianists’ acceptance of astrology (for other Christians did so in comparable ways) but also the degree to which they recognized the relevance of astrology for the human condition which was unique within the history of early Christianity.” That said, they also shared the more popular notion that the resurrection of Jesus was a triumph over astrological fate (Hegedus 2007:344).

governance over the soul to the twelve patriarchs:²⁵⁶

153.19 *Tradidit autem nomina patriarcharum membra esse animae,*
 153.20 *eo quod esset Ruben in capite, Iuda in pectore, Leui in corde,*
 153.21 *Beniamin in femoribus, et similia; contra autem in membris*
 154.1 *corporis caeli signa esse disposita idest arietem in capite,*
 154.2 *taurum in cervice, geminos in brachiis, cancrum in pectore*
 154.3 *et cetera, ...*

He taught, moreover, that the names of the patriarchs were parts of the soul, since Reuben was there in the head, Judah in the breast, Levi in the heart, Benjamin in the thighs, and so on; yet, on the other hand, in the limbs of the body the signs of the heavens were arranged, that is: Aries in the head, Taurus in the neck, Gemini in the forearms, Cancer in the breast, and so on, ...

[*Corpus Scriptorum Ecclesiasticorum Latinorum* 18.153.19-18.154.3]²⁵⁷

This passage shows a Christianization of the idea that serves as the basis of iatromathematics.

Likewise, another heretic, Theodotus (*fl.* mid-late 2nd century CE) gives explicit and incontrovertible evidence of the appropriation of pagan beliefs and their imbue ment with Christian significance:

οἱ ἀπόστολοι, φησί, μετετέθησαν τοῖς δεκαδύο ζῳδίοις, ὡς γὰρ ὑπ' ἐκείνων ἡ γένεσις διοικεῖται, οὕτως ὑπὸ τῶν ἀποστόλων ἡ ἀναγέννησις

He [Theodotus] says the apostles were substituted for the twelve signs of the zodiac, for, as birth is directed by them, so is rebirth by the apostles.

[Clement of Alexandria, Excerpts from Theodotus 25.2]²⁵⁸

Crucial here is the idea that the apostles govern rebirth, serving as tutelars in place of the

²⁵⁶ Hegedus (2007:341-342) calls such associations "... elementary, even naïve ..." and notes that their "... exact meaning is unclear ...".

²⁵⁷ This passage is from Orosius' *Commonitorium* or "Letter of Instruction concerning the Error of the Priscillianists and of the Origenists", which was written to Augustine in 414 CE (Hegedus 2007:339).

²⁵⁸ Text and translation from Hegedus (2007:342; 348 n.28) after Casey (1934:58-59).

signs of the Zodiac.²⁵⁹ This substitution is representative of the substitution “of evangelical freedom for enslavement to destiny”.²⁶⁰

Interesting to note in this pair of passages is the presence of references both to the patriarchs and to the apostles.²⁶¹ Collins notes a synthesis in apocalyptic literature of pre-existing Hellenistic (zodiac, pantheon) and Jewish (patriarchs) symbolism alongside newly developing Christian (apostles) symbols, arguing that the cosmic elements and the repetition of the number twelve reinforce the religious aspects by providing evidence of God’s work.²⁶² Despite the dodecamerous systems in these passages, an explicit connection to the twelve hours is lacking.

The key to interpreting the meaning of the twelve hours in Christian epitaphs is to find a system of meanings to be mapped onto the hours, much as the signs of the Zodiac or the gods of the Pantheon were by pagans. In Christian doctrine the twelve apostles fill this role, corresponding in number to the twelve hours of the day or the night and thereby allowing for a one-to-one correspondence between the former and the latter. Such an association is by no means conjectural; it is attested numerous times in patristic writings.²⁶³

Asterius the Sophist (born in Cappadocia, died after 341 CE) in his Homilies on

²⁵⁹ They also take on this role in Priscillianist doctrine (Hegedus 2007:343).

²⁶⁰ Danéliou (1963:128).

²⁶¹ The patriarchs and the apostles are always to be taken as separate groups of twelve and never as a combined group of twenty-four (Collins 1984:1279).

²⁶² Collins (1984:1284).

²⁶³ I follow here Danéliou (1963). While his analysis is excellent, his method of citation is poor and makes tracing down the passages he cites an overly complex chore.

the Psalms equates the apostles and the hours:²⁶⁴

[14] ... Ἐκλέλοιπεν ὁσιος. Τὸ ὠρολόγιον τῶν ἀποστόλων ἐκολόβοσε. Τὴν δωδεκάωρον ἡμέραν τῶν μαθητῶν ἐνδεκάωρον ἐποίησε. ... ὅθεν καὶ ἐνδέκατος ὁ ψαλμὸς ἐν ᾧ φέρεται ὁ τῶν ἑνδεκα κατὰ τοῦ δωδεκάτου ὀλυλυγμός, ...

[14] ... *There is no righteous man. [Judas] has maimed the clock (ὠρολογιόν) of the Apostles. Of the disciples' twelve-hour (δωδεκάωρον) day he has made a day of eleven hours. ... And for that reason is it in the eleventh psalm that the Eleven lament over the Twelfth.*

[Asterius, Homilies on the Psalms, XI.2.14]²⁶⁵

The imagery of the clock hints at a connection between the hours and the apostles. St. Ambrose (340-397 CE; born in Trier)²⁶⁶ is less explicit than Asterius, but the connection is evident nonetheless.

Ergo si dies totum tempus est mundi, habet utique etiam in saeculis horas suas aut ipsa saecula horae sunt. Horae autem diei duodecim sunt. Unde bene in mysterio dies Christus, cuius apostoli duodecim, qui caelesti lumine distinctis in se gratiae vicibus refulserunt.

If the whole duration of the world is one day, then certainly it counts its hours by centuries: in other words, the centuries are its hours. Now there are twelve hours in the day; and in the mystical sense the day is indeed Christ. He has his twelve apostles, shining with heavenly light, in whom grace has its separate phases.

[St. Ambrose, *Exp. Luc.* VII.222]²⁶⁷

Here the hours have several meanings, referring variously to ages of the world, parts of the day, and, by association with Jesus who represents the day, to the Apostles. St.

²⁶⁴ BNP Online *s.v.* 'Asterius §2 Sophis from Cappadocia'. *N.B.* His Homilies on the Psalms (discovered in 1935, edited in 1956) are of disputed origin. They do not quite accord with the views presented in his other works and merit further analysis to determine their nature.

²⁶⁵ Text of Richard (1956) *ad loc.* Translation of Danéliou (1963:124). Danéliou (1963:124 n.1) notes the existence of sundials featuring the signs of the Zodiac or the heads of the gods and suggest that Asterius is referring to a similarly ornamented dial featuring the heads of the apostles.

²⁶⁶ BNP Online *s.v.* 'Ambrosius'.

²⁶⁷ Text of Tissot (1958) *ad loc.* Translation of Danéliou (1963:125).

Augustine (354-430 CE; born Thagaste, N. Africa)²⁶⁸ is more explicit:

... non potuerunt penetrare altitudinem diei, cuius Apostoli duodecim horae fulgentes.

They were not able to reach the height of the day of which the apostles are the twelve dazzling hours.

[Augustine, *Ex. Ps. 55.5 (Patrologia Latina 36, 650A)*]²⁶⁹

He states here quite clearly that the Apostles represent the twelve hours of the day.

Building upon this idea is a passage from Zeno of Verona (bishop of Verona; *fl. c.* 370 CE):²⁷⁰

[4] ... Iesu Christi ... qui vere aeternus est ac sine nocte dies; cui duodecim horae in apostolis, duodecim menses serviunt in prophetis; ...

Christ is the eternal day which truly has no end, and at its service are twelve hours, the apostles, and twelve months, the prophets.

[Zeno of Verona, *Tract. II.45 (Mignei) = Tract. I.33.4 (Löfstedt)*]²⁷¹

As among pagans who would reference the Zodiac or the Pantheon, associations here can be drawn in two ways, namely to the apostles or to the prophets. Methodius of Olympus (bishop of Olympus; lived late 3rd century CE - early 4th century CE)²⁷² presents slightly different imagery:

[XI.3] ... die Reihe der Apostel nach den Stunden des Tages zusammengestellt, heißt der geistige Tag, nämlich der Kirche ...

... the body of apostles, corresponding to the hours of the day, is called the spiritual day, the Church ...

²⁶⁸ BNP Online *s.v.* 'Augustinus, Aurelius (Augustine)'.

²⁶⁹ Text of PLD, *ad loc.* Translation of Danéliou (1963:125).

²⁷⁰ BNP Online *s.v.* 'Zeno of Verona'.

²⁷¹ Text of Löfstedt (1971) *ad loc.* Translation of Danéliou (1963:125).

²⁷² BNP Online *s.v.* 'Methodius'.

[*De Sanguisuga* XI.3]²⁷³

Although the twelve Apostles still represent the twelve hours of the day, they serve as constituent parts of the church rather than Jesus. Hippolytus (Presbyter in Rome; *fl.* early 3rd CE) presents a very brief allegory of Jesus instructing the Apostles to serve as the hours:

He [the Saviour], the sun, once he had risen from the womb of the earth, showed the twelve apostles to be, as it were, twelve hours; for it is through them that the day shall be made known ... And because day, sun, year were Christ, the apostles must be called hours and months.

[*Den Moyses (Patrologia Orientalis 27.171)*]²⁷⁴

Of all these passages that Danéliou presents, he notes that none can be identified as the originator of this tradition; instead, he takes them as representative of a broader pre-existing cultural conception.²⁷⁵ The astrological (and temporal) associations of the apostles originated in artwork,²⁷⁶ brought about by the catalyst of Jewish-Hellenistic interaction.²⁷⁷ Rabbis drew parallels between the signs of the zodiac and the patriarchs and Philo added to this a cosmic dimension.²⁷⁸ The earliest Christians assigned to Jesus the symbolism of the day or the year, with the apostles as the constituent hours or

²⁷³ English translation from Danéliou (1963:125). German translation from Bonwetsch (1917), *ad loc.* This portion of Methodius' text survives only in Old Church Slavonic. Bonwetsch supplies the Greek text where preserved and a German translation elsewhere. The German is presented here, for it is closer to the original than Danéliou's fourth-degree translation (Greek → Slavonic → German → French → English).

²⁷⁴ Translation of Danéliou (1963:126). No Greek is provided, as the text is preserved only in Armenian and Georgian (Brière-Mariès-Mercier 1954: *ad loc.*).

months.²⁷⁹ Different sects built upon these ideas to various degrees.²⁸⁰

Despite the fact that astrology seems to run counter to fundamental tenets of Christian doctrine, Hegedus, in his conclusions, categorizes all uses of astrology by Christians as ‘soft’, in that they afford their adherents at least partial freewill.²⁸¹ In approaching the reasons for the integration of astrological and Christian practices, there is a danger of adding more complexity than the ancients saw. It could well be that the laypeople combined these two traditions because that is what was done and accepted at certain times and in certain places. Equally, though, they may have made a conscious decision to take on these pagan practices in a display of Christianity’s triumph over them. No one interpretation can account for all cases.

Likewise, while it is possible to suggest notions of what hours represented, such as an indication of whom to offer a prayer for the soul of the deceased, the exact connotations of each hour or the tutelary apostle assigned to each hour are more elusive. Definitive interpretations of such systems of twelve members are now lost, difficult to discern, or have little basis in rational thought.²⁸² Thus, we have neither the materials, nor the means, nor the perspective to offer definitive interpretations. At best, it can be argued that the evidence available indicates that dodecamerous systems are grounded in astrological thought.²⁸³

²⁷⁹ Danéliou (1963:135).

²⁸⁰ Danéliou (1963:135).

²⁸¹ Hegedus (2007:372-373). By contrast, ‘hard’ astrology would imply complete determinism.

Conclusions

By the time of Christianity's acceptance by Constantine, the concepts of chronocrators and tutelars are well established. I have already demonstrated that these notions serve as the basis for interpretation of pagan epitaphs that record *horae*. The Christian sample is no different. What changes here are those who serve in these roles. Whereas previously the signs of the zodiac or the gods of the pantheon were associated with the hours and, on the basis of an individual's time of death, were connected with their rebirth into the afterlife, in the Christian period it is the apostles that take on these duties.

The phenomenon of Christianization is well attested. Roman hero worship, for example, gave way to the Christian veneration of saints. The development of the Canonical Hours of prayer serves to illustrate the way in which mundane aspects of Roman life, such as the cardinal divisions of time, could take on great religious import. Similarly, early Patristic and heretical writings give a sense of how other systems were appropriated and integrated to varying degrees and with varying success into Christian practice. In these texts are manifest the evolution of pagan concepts such as the assignation of divinities to govern the limbs of the body, the times of the day, and moments of birth.

Whereas in the pagan record the connections were more tenuous and the interpretation relied more on postulation and extrapolation, here the texts are explicit: the apostles *are* the hours, death *is* rebirth, the apostles *do* govern rebirth. These associations serve to strengthen the interpretation presented for the pagan tradition of recording *horae*. Thus, I argue that the processes that began in the late republic, after Rome entered the

Greek world and first encountered the concepts of finite divisions of the day and genethliological horoscopes, achieve their culmination in the Christian period. References to *horae*, I contend, which serve first as genethliological horoscopes of the afterlife under the tutelage of pagan deities, here maintain their character, but undergo a conversion, much as the Roman empire does, and take on the theology of their new religion.

Conclusions and Recommendations for Further Study

The preceding chapters have identified a heretofore unattested commemorative practice from classical antiquity. While epitaphs recording hours have been documented in considerable numbers over the past few centuries, no one has ever taken the time to study them in detail. Although at first glance they seem little more than a curiosity and, as such, undeserving of scholarly attention, careful study reveals that they can indeed further the modern understanding of antiquity.

The typology described features two classes of inscriptions that record numerical quantities of *horae*, those that contain durations and those that contain points in time. Such inscriptions commemorated people of all ages and all social classes. These epitaphs were set up throughout the entire Latin-speaking part of the Roman Empire, with centers of concentration at Rome and its environs and in North Africa. The inscriptions date to the first-sixth centuries CE.

In all cases the figures of hours recorded function primarily as indications of the time of death. Thus, there is no cause for alarm when seeing precise figures of hours recorded following uncertain figures of years. In some cases, *horae* may serve a secondary role in contributing to durations by noting the final fraction of a day.

The earliest examples date to the early Principate when the practices of inscribing epitaphs and of recording ages were gaining prominence. At this time, ideas concerning the apportionment of time and astrological practice, which had come to Rome in the late Republic, were also becoming more ingrained in Roman thought. Hours, though not of importance in official records, such as the registers of birth, were crucial in casting the perennially-popular genethliological horoscopes. Thus, common Romans had a reason to

be mindful of their times of birth. In viewing death as a rebirth into the afterlife, the hour of death becomes significant as well.

Much as a genethliological horoscope sought to divine information about one's life on the basis of the planetary configuration at the moment of birth, I argue that these epitaphs did likewise for the afterlife on the basis of the moment of death. As well, hours could serve as an indication of which divinity would be the tutelary of the deceased in the afterlife. This practice is paralleled in the assignation of tutelary deities to the months of the year.

As Christianity gained acceptance, these earlier pagan connotations of *horae* undergo a Christianization. Whereas previously the hours had connotations of the pantheon and the Zodiac, they take on associations of the Apostles. Such a shift in meaning is part of a broader trend that is well documented in early patristic and heretical writings.

Ultimately, as one of the constraints of an exercise such as this is the timeframe within which the work must be completed, some avenues of inquiry must by necessity remain unexplored. Studying the Greek inscriptions that record hours would have provided a basis of comparison between Eastern and Western commemorative practice, but it would have required too great an effort in order to amass a corpus. Studying the demographics of those commemorating and commemorated may yet prove fruitful, but for present purposes an analysis of ages and the identification of pagan and Christian grouping proved sufficient. Searching for references to non-numeric indications of time may further corroborate the means of accounting for aberrances in the distribution of the figures of *horae* inscribed. It may be possible to date a much greater percentage of these inscriptions, though such an endeavor would require a great commitment of time and

careful training. Even so, it may prove unfeasible. Finally, a more thorough study of literature on astrology, horoscopy, and the afterlife could bolster the interpretations of Chapters 2 and 3.

Thus, in trying to limit the scope of the project so as to remain manageable, several questions raised are left unanswered. However, those that have been addressed are significant and succeed in demonstrating that the recording of *horae* in Roman funerary inscriptions was a widespread, longstanding, and meaningful practice.

Appendices

Appendix I – *Falsae vel Alienae*

Of the inscriptions in the dataset, thirty-one are flagged by the CIL²⁸⁴ and one by the IG as being *falsae vel alienae*.²⁸⁵ Fortunately, most fall into the latter category, namely, those inscriptions inadvertently attributed to the wrong location as a result of having been moved; however, some do receive the former designation, flagging them as forgeries. Not all of the *falsae* have been removed from the dataset. In cases where *falsae* were not discarded, explanations are given.

A. *Falsae* Removed from the Dataset

1. CIL 06, *01454 = CLE 00400
2. CIL 06, *02060 (p 254*) = CIL 06, 19804

These two inscriptions are marked as Ligurian forgeries. For the second of these, the CIL acknowledges that it records the same inscription elsewhere as genuine.²⁸⁶

3. CIL 06, *03312 = CIL 06, 10824 (p 3507)

This inscription is flagged as a forgery, likely from 1647; again, the CIL

²⁸⁴ This figure of thirty-one refers to records returned by the EDCS. One of these records is flagged twice in the CIL bringing the total to thirty-two.

²⁸⁵ These sections generally – though not as a rule – appear at the beginnings of their respective volumes; in CIL VI, for instance, Part V is dedicated to these inscriptions. The CIL and IG enumerate the inscriptions comprising these lists by a different counting than that employed in the remainder of each volume. All such inscriptions are distinguished from the ‘normal’ inscriptions by an asterisk prefixed to their catalogue numbers.

²⁸⁶ CIL *ad loc.* and esp. VI.V p.254.

acknowledges that the same inscription is listed elsewhere as being genuine.²⁸⁷

4. CIL 10, *01089,130 = CIL 06, 21900
5. CIL 10, *01089,193 = CIL 06, 26927 = IMCCatania 00487
= AE 1992, +00092

These two inscriptions were also originally set up in Rome and later moved to Sicily.²⁸⁸ These however are convincing forgeries.²⁸⁹

B. *Falsae* Not Removed from the Dataset

1. CIL 09, *00259 = Allifae 00189

Flagged as a possible copy.²⁹⁰

2. CIL 12, *00068,2c (*cf.* C.9, below) = CIL 06, 02309 (p 3318) = CIL 06, 22385
= CIL 10, *01045,5 = AE 2006, +00221

Inscriptions catalogued as CIL 12, *00068,2 are copies of genuine inscriptions.²⁹¹

The EDCS returned this specific reference as part of a record that includes the inscription it copies; hence, the record was kept in the dataset.

3. IG-14, *00191 = CIL 06, 10096 (p 3492, 3906)
= CIL 01, 01214 (p 970) = CLE 00055
= D 05213 = ILLRP 00803 = AE 1997,
+00160

²⁸⁷ CIL *ad loc.*

²⁸⁸ CIL *ad loc.*

²⁸⁹ *Ibid.* “*Sequuntur falsae eiusdem generis, descriptae pleraque ex archetypis genuinis.*”

²⁹⁰ CIL *ad loc.*

²⁹¹ CIL *ad loc.*

The IG inscription is a copy of the inscription recorded in the CIL.²⁹² As the copy and the original are both in the same record, it was kept in the dataset.

C. Alienae

- | | |
|------------------------|--|
| 1. CIL 05, *00429,023* | = CIL 06, 02772 (p 3370) = CIL 06, 32660 |
| 2. CIL 05, *00429,093 | = CIL 06, 18174 |
| 3. CIL 05, *00429,098* | = CIL 06, 03610 = CIL 06, 20611 |
| 4. CIL 05, *00429,113* | = CIL 06, 07956 = ICUR-08, 23509 |
| 5. CIL 05, *00429,233 | = CIL 05, 03143 = CLE 01120 |

These five inscriptions are collected under the grouping of CIL 05, *00429, which refers to a collection of inscriptions mistakenly attributed to Verona. Those with terminal asterisks are of uncertain provenance, despite being catalogued in CIL 06; the remainder were originally set up at Rome.²⁹³

- | | |
|-------------------|-----------------|
| 6. CIL 09, *00074 | = CIL 06, 24262 |
|-------------------|-----------------|

An inscription moved from Rome.²⁹⁴

- | | |
|---------------------|----------------------------------|
| 7. CIL 09, *00632,7 | = CIL 06, 18318 = ICUR-08, 22456 |
|---------------------|----------------------------------|

Moved from its original location in Rome.²⁹⁵

- | | |
|---------------------|-----------------|
| 8. CIL 10, *00771,2 | = CIL 06, 26640 |
|---------------------|-----------------|

²⁹² IG *ad loc.*

²⁹³ CIL *ad loc.*

²⁹⁴ CIL *ad loc.*

²⁹⁵ CIL *ad loc.*

Moved from Rome.²⁹⁶

9. CIL 10, *01045,5 (*cf.* B.2, above) = CIL 06, 02309 (p 3318) = CIL 06, 22385
= CIL 12, *00068,2c = AE 2006, +00221

Moved from Rome.²⁹⁷

10. CIL 10, *01088,024 = CIL 06, 11569
11. CIL 10, *01088,030 = CIL 06, 11858 = IMCCatania 00055
12. CIL 10, *01088,062 = CIL 06, 13166 = IMCCatania 00272
13. CIL 10, *01088,255 = CIL 06, 23058
14. CIL 10, *01088,265 = CIL 06, 05714
15. CIL 10, *01088,383 = CIL 06, 29151

These six inscriptions catalogued under CIL 10, *01088 are all inscriptions from Rome that were brought to Sicily.²⁹⁸ Although they are all thought to be genuine, some specimens had been lost by the time CIL 10 was compiled and as such, the editors relied on other volumes for their information.²⁹⁹

16. CIL 11, *00078,24 = CIL 06, 21232

One of a group of inscriptions moved from Rome and used to adorn a library.³⁰⁰

17. CIL 11, *00101,071 = CIL 06, 16767
18. CIL 11, *00101,118 = CIL 06, 23448

²⁹⁶ CIL *ad loc.*

²⁹⁸ CIL *ad loc.*

²⁹⁹ *Ibid.*

³⁰⁰ CIL *ad loc.*

19. CIL 11, *00101,127 = CIL 06, 24388

Inscriptions catalogued under CIL 11, *00101 come from Rome.³⁰¹

20. CIL 11, *00103,5 = CIL 06, 20786

21. CIL 11, *00104,2 = CIL 06, 09938 (p 3471) = CLE 00989

22. CIL 11, *00124,4 = CIL 06, 28239 = CLE 00447 (p 855)
= CLE +00805

These three inscriptions also come from Rome.³⁰²

23. CIL 11, *00250,2c = CIL 10, 03547

An inscription originally set up in Latium and Campania.³⁰³

24. CIL 11, *00259,103 = CIL 06, 10784

This inscription was taken from Rome in 1740/1.³⁰⁴

25. CIL 14, *00180a12 = CIL 06, 21122

Yet another inscription moved from Rome.³⁰⁵

Curriculum Vitae

Name: Simeon David Ehrlich

Post-secondary Education and Degrees: The University of Western Ontario
London, Ontario, Canada
2006-2010 B.A. (Hons.)

University of St Andrews
St. Andrews, Fife, Scotland, UK
2008-2009 Visiting Robert T. Jones, Jr. Scholar

The University of Western Ontario
London, Ontario, Canada
2010-2012 M.A.

Honors and Awards: The Canadian Robert T. Jones, Jr. Scholarship
2008-2009

The University of Western Ontario Gold Medal in Honors
Specialization Classical Studies
2010

Social Science and Humanities Research Council (SSHRC)
Canada Graduate Scholarship – Master’s
2010-2011

Province of Ontario Graduate Scholarship
2011-2012

Archaeological Fieldwork: Trench Supervisor
Nysa-on-Meander, Aydin Province, Turkey
2010

Assistant Square Supervisor
The Leon Levy Expedition to Ashkelon, Israel
2011

Square Supervisor
The Leon Levy Expedition to Ashkelon, Israel
2012
