

# 3. REMARKS ON HOW TO MAP THE EUROPE 2020 STRATEGY

Marta Calvet <marta@mcrit.com> Andreu Ulied <ulied@mcrit.com> Oriol Biosca <obiosca@mcrit.com> MCRIT SL (Barcelona)

#### 3.1. Introduction

The aim of this chapter is to explain the cartographic criteria set to produce the final maps which have been included on the Europe 2020 Atlas. As the main objective of the SIESTA Project has been to map the Europe 2020 Strategy (EU2020S), maps have been one of the key issues. The Europe 2020 Atlas is the main output of SIESTA Project and it aims to present, as a synoptic and compressive way, the current situation of European regions in relation to the EU2020S. The final version of the Europe 2020 Atlas presents 50 maps. It is structured in the same manner like the EU2020S, based on three pillars and seven flagships initiatives. Following the EU2020S, the Europe 2020 Atlas is structured as listed below:

#### Sustainable Growth:

- o Growth and Competitiveness in a Crisis Differently Affecting the European Territories.
- o Territorial dissimilarities in Energy and Climate Change.

#### Smart Growth:

- Research, Development and Innovation across the European Territories.
- The Territorial Dimension of Education.
- o Persisting Digital Society Territorial Divides.

#### Inclusive Growth:

- The Territorial Configurations of Employment and Lifelong Learning.
- o Territorial Dissimilarities in Poverty and Exclusion.

Within each of these categories, the SIESTA Project has designed three basic types of maps:

- Maps by themes, illustrating the current state of European regions in relation to each of the themes analysed by the SIESTA Project.
- Maps of progress towards the EU2020S headline targets, illustrating the degree of accomplishment of the official EU2020S set targets in each region.
- Larger urban zones (LUZ) maps, illustrating the current state of cities in relation to each theme analysed.

The Atlas is available on paper format as output of Final Report of SIES-TA Project, and also on a digital version available at the ESPON Map Finder tool (<a href="http://mapfinder.espon.eu">http://mapfinder.espon.eu</a>). As in March 2013, twelve SIESTA Project Maps are already available digitally and it is planned to have the full EU2020S published online during Spring — Summer 2013. The ESPON Map Finder is a tool of the ESPON programme aimed at making available the most policy communicative maps produced by ESPON financed projects to the scientific community and to policy makers.

Figure 3.1. Table of contents of the EU2020S Atlas.

<sup>1</sup> LUZs are an approximation of the functional urban zone centred around a town/city, within the Urban Audit methodology (Urban Audit, 2004).

## 3.2. Mapping Criteria for the EU2020S

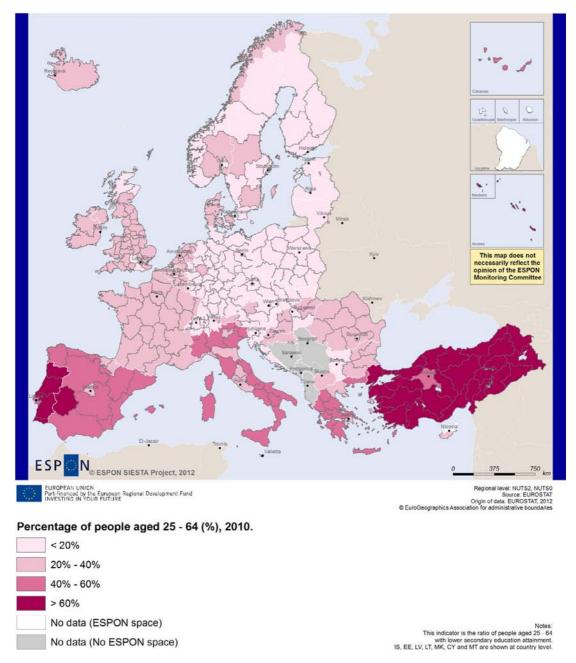

According Edward Tufte (2001), in one of most influential studies on the subject, excellence in statistical graphics, and mapping, consists of complex ideas communicated with clarity, precision and efficiency. Graphical and cartographic displays must induce the viewer and reader to think about the substance (a given scientific result or political message) rather than about something else, encourage the eye to compare different pieces of data, reveal the data at different levels of detail, from a broad overview to a fine structure, serve a reasonably clear purpose and be closely integrated with statistical and verbal descriptions of the dataset. After all, graphics and maps *reveal data*.

### 3.2.1. Maps by Themes

Maps by themes show the static data of each indicator. The data represented are ranked generally in 4 classes and presented as choropleth, where areas of NUTS0, NUTS1, NUTS2 or NUTS3 are patterned in proportion to the measurement of the statistical variable being displayed on the map. On these maps, data are presented in graduated colours where colours are ordered progressively from low to high. Light colours are used to show low data values and dark colours are used to show high data values. Map 3.1 is provided as an example.

Table 3.1. Mapping Criteria for Maps by Themes. Source: SIESTA 2013.

Indicators represented	Colours ramp	Data classification method
Smart Growth		
Innovation	Violet	Equal Interval in 4 classes
Education	Brown	Equal Interval in 4 classes
Digital Society	Purple	Equal Interval in 4 classes
Sustainable Growth		
Competitiveness and Economic Growth	Blue	Equal Interval in 4 classes
Green Economy, Climate Change and Energy	Orange	Equal Interval in 4 classes
Inclusive Growth		
Employment, Skills and Jobs	Rose	Equal Interval in 4 classes
Poverty and Exclusion	Pink	Equal Interval in 4 classes

Map 3.1. Persons (aged 25 to 64) with low educational attainment (level 1 or 2 ISCED) by regions, 2010.

## 3.2.2. EU2020S Headline Target Maps

These maps show EU2020S headline targets to be achieved in 2020, as follows:

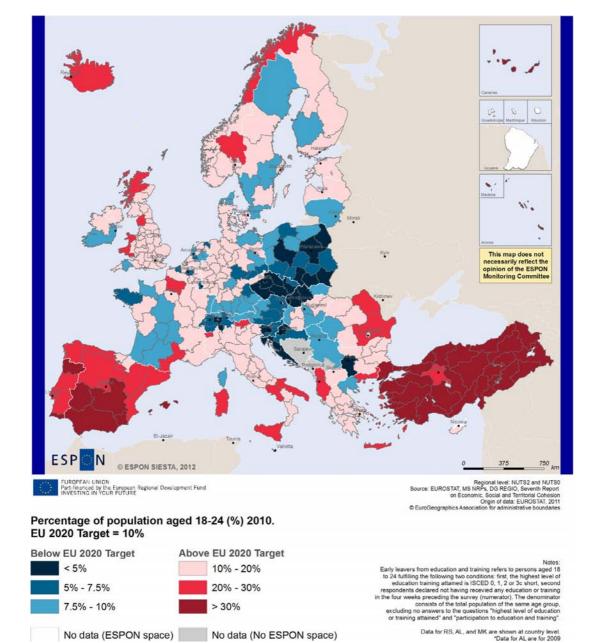

- Employment rate (population aged 20-64).
- Gross Domestic Product invested in R&D.
- Greenhouse gas emissions in relation to 1990 levels.
- Energy from renewable sources.
- Energy efficiency represented as reduction of energy consumption (Mtoe).
- Early school leavers rate (population aged 18-24).
- Population aged 30-34 completing third level education.
- At least 20 million fewer people in or at-risk-of-poverty and social exclusion.

Each target is shown in three different ways: present state in relation to EU2020S target; distance to the national target achievement; and change over time. The data represented are ranked generally in 6 classes, where areas of NUTS0, NUTS1, NUTS2 or NUTS3 are patterned in proportion to the measurement of the statistical variable being displayed on the map. Data represented are shown in two different colour ramps, one colour ramp for negative values and the other one, for positive values.

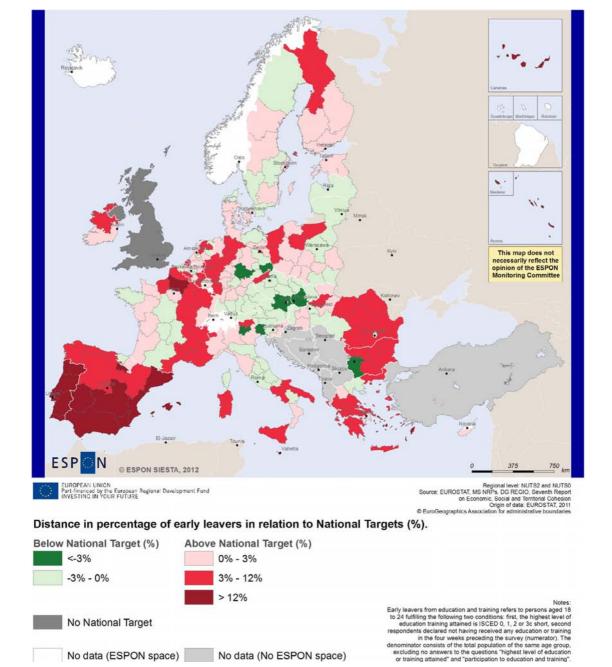

Present state in relation to EU2020S target maps show data in six different classes. Values below EU2020S headline target are shown in red colour ramp, and values above are shown in blue ramp. Map 3.2 is provided as an example.

Distance to national target maps show data in six different classes. These maps show distance from current value to the target set by each country. Negative values are shown in red colour ramp, and positives values are shown in green ramp. If the national target has not been set, no data are shown. Map 3.3 is provided as an example.

Change over time maps show data in six different classes. The intention of the SIESTA Project has been to have all the headline targets mapped in trends for the last decade. However, considering the general problems related to the lack of large datasets at regional level, we must recognise that there is reduced possibility of developing maps showing more than a given year, thus showing trends (development over time). Negative tendencies are shown in brown colour ramp, and positive tendencies are shown in green ramp. Map 3.4 is provided as an example.

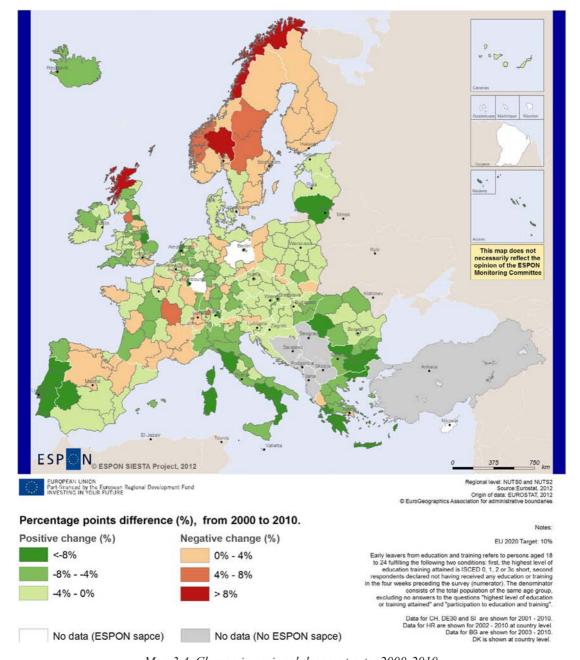

Map 3.2. Regional early school leavers from education and training as percentage of population aged 18 to 28 (drop-out rate), 2010.

Map 3.3. Regional drop-out rate represented as distance to the 2020 national targets, 2010.

No data (ESPON space) No data (No ESPON space)

Map 3.4. Change in regional drop-out rate, 2000-2010.

## 3.2.3. Larger Urban Zones Maps

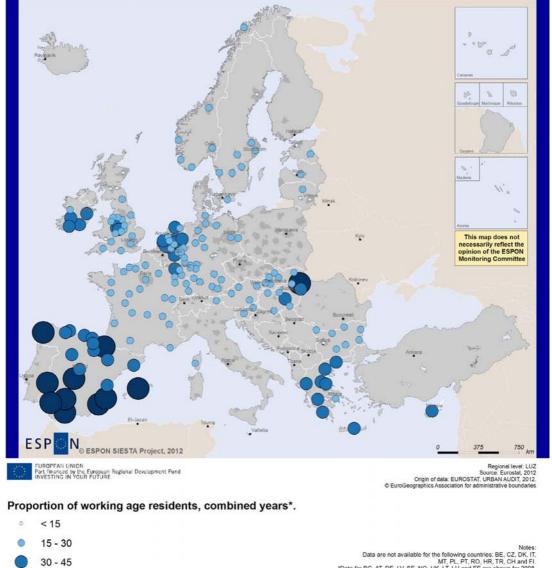

These maps show data values of urban areas. In the SIESTA Project cities were always statistically considered as larger urban zones (LUZ) or functional urban areas (FUA). Cities were not studied individually. This is consistent

with the ESPON research in this respect, which has prevented urban areas in Europe being considered only by using the data of the central city in each case (see Projects FOCI in ESPON 2013 and 1.1.1 in ESPON 2006).<sup>2</sup> This means that URBAN AUDIT is only valid when it offers data at the LUZ/FUA level.

The most of the URBAN AUDIT datasets considered showed a marked lack of data in several countries; we did not get a satisfactory urban data coverage for the EU27, even by combining several years, for most of the URBAN AUDIT preselected indicators. This fact has finally compromised the use of the maps derived from URBAN AUDIT indicators in the Atlas, although the datasets were considered in the elaboration of the preliminary territorial research.

Data represented are ranked generally in 4 classes and they are shown as symbol (a circle), where size of the symbol is proportioned to value of the statistical variable being displayed on the map. The colour of the symbols is linked to the thematic maps. Map 3.5 is provided as an example.
