## IMAGES OF THE MONTH

## What is the diagnosis?

### Question

A 5-month-old girl lives on a farm in the country in New South Wales with multiple types of livestock. The property has tank water supply. The infant has been passing large numbers of red, curly, thread-like objects in her nappies for the last few days (see Fig. 1). She is breast-fed, has had some pureed feeds recently, is thriving and her physical examination is normal. Other family members including a toddler sibling are asymptomatic.

What is the diagnosis and how would you treat this 5-monthold infant? (Answer on page 127)

Dr Ameneh Khatami<sup>1</sup> Ms Jennifer L Worrall<sup>2</sup> <sup>1</sup>Fellow, Department of Infectious Diseases and Microbiology, Children's Hospital at Westmead, Westmead, NSW, Australia and <sup>2</sup>Visiting Medical Student, University of Bristol, Bristol, United Kingdom

# Serpiginous lesion on the foot

#### Question

A 7-year-old Portuguese girl presented with a 15-day history of a pruritic, erythematous, serpiginous eruption on the dorsum of the left foot (Fig. 1). She returned from a trip to Brazil where she walked barefoot. She denied any systemic symptoms. What is your diagnosis? (Answer on page 127)
