Summary

Honey bee pollen is considered to be a food, and national pollen standards exist in different countries such as Brazil, Bulgaria, Poland and Switzerland. It is the aim of the present work to review pollen composition and the analytical methods used for the evaluation of high quality bee pollen. Based on the experience of different countries and on the results of published research, we propose quality criteria for bee pollen, hoping that in the future they will be used as world wide bee pollen standards.

Keywords: Standardisation of bee products; bee pollen; quality control

High Quality

Proposed technical regulation for the identity and quality of bee pollen

Technical regulation for identity

Objective: To establish the identity and the minimum quality requirements for bee pollen.

Target: The regulation will be applied to bee pollen sold in national and international markets.

1. Description

1.1. Definition: Bee pollen is the result of the agglutination of flower pollens, made by worker honey bees, with nectar (and/or honey) and salivary substances, and collected at the hive entrance.

1.2. Classification:

1.2.1. According to water content:

1.2.1.1. Bee pollen: The product collected in the original form, with water content between 20-30 %. Storage of such pollen should be in a freezer to avoid bacterial and mould contamination.

1.2.1.2. Desiccated bee pollen: The product submitted to a drying out process in temperatures not higher than 42°C, with water content not higher than 6%.

1.2.2. According to the floral source content:

1.2.2.1 Monofloral bee pollen: the major *taxon* need to be not less than 80% (different *taxa* can be used for specific nutritional and therapeutic purposes).

1.2.2.2 Multifloral bee pollen: include different *taxa*.

1.3. Denomination for sales purposes will include classification according the water and floral source content.

Human Medicines - Herbal Medicinal Products

Directive 2004/24/EC1 introduced a new pathway for marketing traditional herbal medicinal products, the "simplified registration".

The Committee on Herbal Medicinal Products (HMPC) has been established in the framework of Directive 2004/24/EC and Regulation (EC) No 726/20042.

The main task of the Committee is to establish Community herbal monographs and entries to the 'list of herbal substances, preparations and combinations thereof for use in traditional medicinal products'. Community monographs and entries to the Community List established by the HMPC

ABSTRACT

Around the world many things have been related to the health benefits of bee-pollen and different therapeutic bioactivities. Few researches have been done in a way to prove the importance to explore the potential of bee-pollen as a source of new drugs. In the 90ths the interest for this product increased and relevant research has been undertaken. The major lack on the most of the results published is the relationship between the pharmacological activity and the compounds involved. And in some cases it can only be verified through the pharmacodynamic activity because the assay with a well correlated dose effect and the quantification of the molecules and the pharmacokinetic of them is very hard to attribute. Different therapeutic bioactivities attributed to bee-pollen have been reviewed in this paper presenting the more relevant research published so far. From the data published here it's obvious that pollen itself and bee-pollen have a good potential of bioactivity that can be explored with different approaches. However, research is still needed to confirm many of these preliminary findings. Nevertheless it still remains a promising remedy to cure various human ailments..

Key words : Antiatherosclerotic, anti inflammatory, antioxidant, bee-pollen, osteoporosis, prostatitis

Floral origin – bioactivity compounds

Anaemia and the hemopoietic system – bee pollen - Iron

Antioxidant activity – *Eucalytus globulus* – flavonoids + ??

Anti inflammatory activity - *Pinus densiflora* – flavonoids ??

Antitumoral activity – *Brassica napus* – polysaccharide LBPP

Antiatherosclerotic activity - fat-soluble pollen extract

Activity on osteoporosis – *Cistus ladaniferus* – PM \leq 1000

Activity in Disorders of the Prostate – Hidroxamic acid

Antidiarrhoeal activity - *Eucalytus globulus*; *Salix atrocinera*

Antimicrobial activity – *Ranunculus* sp – herbacetin (flavonoid)

criteria:

Significant substances except for those of natural origin from bees, wood, plants and the process of pollen by the producer. Specific tolerance criteria will be established.

These criteria correspond to the hygienic standards required for microbiological and chemical levels (Table 1).

Labels must be labelled with: denomination of the product, net weight, if necessary for a specific product, and nutrients (carbohydrates, fats, proteins) above the limit for consumption, and allergen information. The producer will need to provide a certificate of analysis for each batch.
