ENROLLMENT PROJECTIONS FOR MISSOURI
ELEMENTARY AND SECONDARY PUBLIC SCHOOLS

Prepared by

Warren G. Glimpse

Public Affairs Information Service
College of Business and Public Administration
University of Missouri-Columbia

for the

Division of Budget and Planning

Missouri Office of Administration

October, 1975

The preparation of this report is financed in part through a comprehensive planning grant (CPA-MO-07-36-1023/SA-350) from the Department of Housing and Urban Development and contracted through the Missouri Office of Administration.

PREFACE

This report has been prepared to facilitate the development of a standardized set of Missouri elementary and secondary enrollment projections based upon existing information concerning enrollment participation and related demographic processes subject to certain underlying assumptions and constraints. It is the intent that these projections be used as interim, provisional projections for planning and decision-making research and analysis objectives undertaken by the Missouri Department of Elementary and Secondary Education and the Division of Budget and Planning of the Missouri Office of Administration.

It is not intended that these projections reflect an optimal nor desirable growth policy of the State, but rather the most probable events based upon currently compiled information. These projections are subject to modification and change as additional and more recent data become available and as the behavioral processes change.

The underlying methodology used in these projections has been developed by Bertha B. McClaskey of the Department of Elementary and Secondary Education, Michael Boxberger of the Division of Budget and Planning, and Warren G. Glimpse of the Public Affairs Information Service. Chai-Hung Luk and Jane Sadell of the Public Affairs Information Service, have been responsible for programming, data development, and actual generation of the projections. The responsibility for interpretation and application of these methods resulting in the projections contained in this report remain with the author.

Enrollment Projections for Missouri Elementary
and Secondary Public Schools

This report describes the methodology used to develop interim, provisional projections of elementary and secondary public school enrollment by grade using a participation-grade progression method and presents the provisional projections for the state and by region for school years 1975-76 through 1979-80.

The methodology described here is based in part on established procedures for developing enrollment projections used by the Department of Elementary and Secondary Education in the past. The technique is based upon a deterministic model with the only trending parameter being a smoothing procedure to minimize the impact of irregular levels of enrollment or births in a given year. The underlying model is based upon relationships shown in equations (1) and (2).

$$(1) \frac{E_{i,j}(t+1)}{B_i(t-4-j)} = \left\{ \sum_{k=0}^m \frac{E_{i,j}(t-k)}{B_i(t-k-j-5)} \right\} /n; j=0,1$$
$$(2) \frac{E_{i,j}(t+1)}{E_{i,j-1}(t)} = \left\{ \sum_{k=0}^{m-1} \frac{E_{i,j}(t-k)}{E_{i,j-1}(t-k-1)} \right\} /n; j=2, \dots, 12$$

where the symbols denote the following:

- E enrollment
- B resident live births
- i religion
- j grade
- n number of historical years
- m n - 1
- t current time period

Equation (1) applies to grades 0 (kindergarten) and 1, whereas equation (2) applies to grades 2 through 12. The underlying assumption in equation (1) is that the ratio of the number of persons enrolled in region i at grade 0 (or 1) at time t + 1 (the projection period) to the resident live births in region i five years earlier (or 6 if j = 1) is the same as the average rate for the n

historical periods beginning with the current time period. Thus, as the values of all variables are known, except for $E_{i,j}(t+1)$, the enrollment can be projected by solving for this variable. Similarly, equation (2) states that the ratio of the number of persons enrolled in region i in grade j at time $t+1$ to the number of persons enrolled in region i in grade $j-1$ at time t is equal to the average ratio for n historical periods beginning with the current time period. Rearranging equations (1) and (2), the projection for one year ahead is obtained as shown in equations (3) and (4), respectively.

$$(3) \quad E_{i,j}(t+1) = B_i(t-4-j) \times \left\{ \sum_{k=0}^m \frac{E_{i,j}(t-k)}{B_i(t-k-j-5)} \right\} /n; \quad j=0,1$$

$$(4) \quad E_{i,j}(t+1) = E_{i,j-1}(t) \times \left\{ \sum_{k=0}^m \frac{E_{i,j}(t-k)}{E_{i,j-1}(t-k-1)} \right\} /n; \quad j=2,\dots,12$$

Throughout this methodology when t is used with enrollment data, the data being used are the cumulative enrollment data report at the close of school year t . These data include double counting as they are defined to be inclusive of all students registered during the year. $E_{i,j}(73)$ denotes the enrollment in region i in grade j during the 1973-74 school year. Similarly, when t is used with resident live birth data, t refers to the calendar year in which the births occurred. Thus, $B_i(73)$ denotes the number of resident live births in region i during the calendar year 1973. It is recognized that age distributions with respect to the associated grade of enrollment will vary slightly from year to year; and that further for any one grade, students of two to three ages will be enrolled. It is assumed, since ratio methods are being used, that the impact and significance of these differences will be negligible. For illustrative purposes the distribution of persons by grade

by age are shown in Table 1 as derived from special tabulation of the 1970 Census Public Use Sample. Note that while this table is based upon the 1969-70 school year the tabulation is based upon age data as of April 1, 1970.

Table 1 depicts the diffusion of multiple ages enrolled in any given grade.

To insure that the summation of the regional enrollment projections are equal to the state projection, the state projection is developed first and used as a control total. Each of the regions are adjusted upward or downward by the proportion in region i in grade j to the summation of the regions in grade j . This proportion is multiplied times the differential as shown in equation (5) to arrive at the control total projection for region i in grade j .

$$(5) E_{i,j}^*(t+1) = \frac{E_{i,j}(t+1)}{\sum_{i=1}^{11} E_{i,j}(t+1)} \times \left\{ E_{s,j}(t+1) - \sum_{i=1}^{11} E_{i,j}(t+1) \right\} + E_{i,j}(t+1)$$

where $E_{s,j}(t+1)$ denotes the enrollment projection for the state in grade j at time $t + 1$ as determined by application of equations (3) and (4). The eleven areas are shown on the map and correspond to the Supervisory Districts as established by the Department of Elementary and Secondary Education. However, the program developed can prepare the projections for any regional county grouping or by single county.

Procedures described above only relate to the development of projections one year ahead. Projections are developed for subsequent years using an iterative process whereby the underlying techniques described in equations (1) through (5) apply, but projected values are substituted for historical values of enrollment for the required time periods beyond the current period, t . Note that when projecting only five years ahead, projections of resident live births are not required due to the lag.

Table 1
Enrollment by Age of Student - Missouri - 1970

MISSOURI

ENROLLMENT PROJECTION REGIONS

The generalized equation corresponding to (1) and (2) when projecting ahead to period $t + g$ are shown in equations (6) and (7), respectively.

$$(6) \frac{E_{i,j}(t+g)}{B_i(t+g-3-j)} = \left\{ \sum_{k=0}^{g-1} \frac{\hat{E}_{i,j}^*(t+k)}{B_i(t+k-j-5)} + \sum_{k=1}^{m-g+1} \frac{E_{i,j}(t-k)}{B_i(t-k-j-5)} \right\} / n; j=0,1$$

$$(7) \frac{E_{i,j}(t+g)}{E_{i,j-1}(t-g-1)} = \left\{ \sum_{k=0}^{g-1} \frac{\hat{E}_{i,j}^*(t+k)}{E_{i,j-1}^*(t+k-1)} + \sum_{k=1}^{m-g-1} \frac{E_{i,j}(t-k)}{E_{i,j-1}(t-k-1)} \right\} / n; j=2,\dots,12$$

where $\hat{E}_{i,j}^*$ denotes a projected value for enrollment in region i in grade j where the time subscript is beyond the current period, t , and otherwise the historical enrollment observation.

The foregoing procedures apply only to kindergarten and grades 1 through 12. Due to uncertainty in the behavior of ungraded elementary and ungraded secondary enrollment, projected values for these variables were set at their value in the current time period for each of the projection periods.

Past enrollment projections using methods similar to these utilized five historical periods to project five future periods. In terms of equations (1) through (7) this means that $n = 5$. It might be argued that only the most recent year is relevant since technically no trend nor other projection parameter is established with n . Alternatively it may be argued that $n = 3$ to smooth irregular historical observations. Several values of n were evaluated to determine the sensitivity of the projection process with respect to how many historical periods should be considered. As shown below, the size of n does not seem to have a great impact on the projection. The projections contained in this report are based on $n = 5$.

State Projection

<u>n</u>	<u>1975-76</u>	<u>1979-80</u>
3	1,036,926	952,702
4	1,037,080	954,077
5	1,036,711	955,468

To verify the accuracy of this projection method, the 1974-75 enrollments were projected and compared to the known historical values. For the state, the projected total was 1,053,244, using $n = 4$. The actual total was 1,053,879. The difference of 635 reflects a 0.06 percent error. Of course, the further into the future, the less reliable the accuracy of the projections. This is in part due to cumulative error developed in the iterative process of projection. It is also in part due to assumption of zero net migration and/or constant migration patterns for those cohorts born in region i in period $t - 5$ and enrolled in grade 1 in region i at period $t + 1$. Finally, there will be error because this type of model cannot produce full information about the behavioral process. Parametric equations should be used to at least in part better establish the behavioral relationships between the location and characteristics of the cohorts from which the enrollment will be drawn.

Digitization Information Page

Local identifier EconResltm0012

Capture information

Date captured 07/2013
Scanner manufacturer Zeutschel
Scanner model OS 15000
Scanning system software Omniscan v.12.4 SR4 (1947) 64-bit
Optical resolution 600 dpi
Color settings 24 bit color
File types tiff

Source information

Content type text
Format book
Source ID
Notes Source is a stapled packet of standard 8.5 X 11
sheets.

Derivatives - Access copy

Compression	Tiff:compression: 1
Editing software	Adobe Photoshop CS5
Editing characteristics	
Resolution	300 dpi
Color	gray scale / color
