Co-Adviser's Last Name:

Graduation Term:SP 2015

Department:Microbiology- Medicine

Degree:PhD

Title:Role of T Cell Receptor Signaling in CD8 T Cell Memory

The generation of immunological memory is the basis for vaccination. The development of memory CD8 T cells is required for long-term protection against intracellular pathogens, such as viruses, and tumors. While the importance of memory generation has been recognized for over 30 years, the mechanism by which memory CD8 T cells arise during immune responses is still not fully understood. T cell receptor (TCR) interaction with antigen (immunogenic peptide)-bound MHC is necessary for activation and differentiation of CD8 T cells. Yet, how the resulting TCR signal regulates T cell memory is unknown. In this dissertation, we investigated the role that the TCR signal plays in memory differentiation. First, we explain how the strength of pMHC-TCR interaction affects memory generation. We also demonstrate that the signals for the development of memory are different depending on TCR ligand strength. Finally, we define a mechanism by which TCR signaling programs memory differentiation. All vaccines utilize pathogen-specific antigens to induce immunological memory. By understanding how antigenic signals program memory differentiation, it will be possible to specifically manipulate this process. We can then produce more effective and longer lasting memory cells.
