#### **ACKNOWLEDGMENT**

This is a joint contribution of the Department of Field Crops, University of Missouri Agriculture Experiment Station and the Crops Research Division, Agricultural Research Service, U.S.D.A.

Author O. V. Singleton is an instructor, Department of Field Crops, University of Missouri, and M. S. Zuber is research agronomist, Agricultural Research Service, U.S.D.A., and research associate, Department of Field Crops, University of Missouri. The bulletin reports on Department of Field Crops Research Projects 85 and 310.

The statistics pertaining to corn production were furnished by A. C. Brittain of the U.S.D.A. Agricultural Marketing Service, Columbia, Mo. Climatological data were furnished by Dr. Wayne Decker, associate professor of climatology of the Missouri Agricultural Experiment Station.

The following individuals assisted in making the 1960 Corn Yield Trials possible: Norman Brown, Carl Hayward, Earl Barnes, Wm. H. Odom, C. L. VanBuren, Wm. A. Crane, Gene Hill, Fred Harmon, Clayton Morris, Ray Schmidt, Earl Shockey, Anderson Meadows, D. L. Shrauner, Claude Lemon, Wilbert Fahrmeier, A. H. Sievert, Joy Ortloff, Hugo Schnakenberg, Ben F. Geisert and Sons, Howard Wuertley and Dan Massie. The following agricultural Extension agents also aided in conducting these tests: Edward Meek, Andrew Adam, John W. Douglas, Lloyd Redd, Leonard Douglas, Ed Schwitzky, Richard Prewitt, Paul Burgess, Doyle Jones and Dow Jenkins.

Average yield for the 1960 Missouri corn crop is estimated at 53 bushels per acre. Average yield of all hybrids tested at the 17 yield trial locations was 102 bushels per acre. The highest yielding hybrid, Mo W6 (cert.), produced 154 bushels per acre at Marshall. The total rainfall from May 1 to September 15 ranged from less than 10 inches to more than 35 inches, while the number of days with temperatures above 90° varied from 23 to 67 at the different locations. Dry periods of 15 to 45 days in July and August were reported at several locations. Acre yields were reduced materially by these and other factors at several locations. This was very apparent at Clarence, Kirksville, Wayland, Ellington and Cole Camp. Heavy rains in May delayed planting until June at some locations and resulted in later maturity with high grain moisture at harvest. In general, stalk lodging was lower than usual throughout the state. Only 5 locations had more than 9 percent.

## TESTING PROCEDURES

### Testing Areas

The state was divided into nine districts with two tests located in each except District 5 in which there were three tests. Figure 1 shows the districts and locations of testing fields. The nine districts match those currently used for reporting the Missouri Farm Census.

### Seed Source

In 1960 all producers and distributors of hybrid seed corn were eligible to enter these tests. No limit was placed on the number of hybrids any one company could enter and any hybrid could be entered in as many districts as desired. Fifteen pounds of seed for each district were sent in by firms for each entry. Seed for the open-pedigree hybrids was furnished by the state and federal agricultural experiment stations and by certified seed producers.

### Type of Field Design

The number of hybrids tested in each district varied from 48 in District 8 to 72 in District 9. The hybrids were planted with each hybrid in four plots at each testing location. Plots consisted of two rows of five hills; they were located at random over the testing area to minimize cultural and soil differences.

### Stand

All tests were planted at the rate of five seeds per hill. Plants were thinned to three or four per hill, the number depending upon expected environmental conditions. The stand percentage was computed on the basis of the total plants present divided by the number required for a perfect stand.

### Lodging

A plant was classified as "root-lodged" if it leaned from the base more than 30 degrees from the vertical and "stalk-lodged" if it was broken below the ear. If a plant was both root and stalk lodged, it was counted in both categories. The percent was based on the total plants present.

### Dropped ears

The total number of ears dropped by each hybrid was recorded at harvest. This number was divided by the total number of plants present and multiplied by 100 to give the percent of ears dropped. It was assumed that each plant produced one ear.

### Ear Height

The ear-height grade was determined from averages of the four plots of a hybrid at a location. Measurement consisted of the approximate number of feet from the base of the plant to the point of attachment of the upper ear.

### Moisture

The grain moisture of each entry was determined at harvest by removing two rows of kernels from each of 10 ears, randomly selected from the first and fourth replications. The grain from each replication was thoroughly mixed and the moisture content of a 100-gram sample was determined for each replication with a Steinlite moisture meter. The moisture percentage reported is the average of the two replications.

### Yield

The corn from each plot was harvested and weighed. Yield was determined on the basis of shelled corn with a moisture content of 15.5 percent. Adjustments were made for missing hills but not for other variations in stand. Therefore, the yields at each location constitute an average yield of the four plots after all adjustments were made.

## 1960 RESULTS

Results reported for each district are for tests conducted in 1960. Summaries are for 1958, 1959, and 1960. It is hoped that more closed-pedigree hybrids will be re-entered in the same districts for at least 3 years so results can be compared for longer periods.

It has been the policy of many to select hybrids on a single year's results or results from a single location. This is risky as environmental conditions fluctuate from year to year. The best hybrids are those which perform well over a period of years.

## DISTRICT 1

Data for District 1 are reported in Tables 1A to 1F. The second highest rainfall for any of the locations was reported at Tarkio. Temperatures in this location were above normal.

Table 1A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959), 1958, 1959 and 1960 in District 1.

		Farmland Planted to Corn (%)	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri Corn Yield Tests

## DISTRICT 2

Tables 2A to 2F give the 1960 results and 3-year summary for District 2. Climatic conditions were fairly favorable at Spickard, resulting in above average yields.

Spickard received the highest rainfall reported for any location. Three dry periods during the growing season at Kirksville caused a material reduction in yield.

Table 2A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959), 1958, 1959 and 1960 in District 2.

### DISTRICT 3

Results for District 3 are given in Table 3A to 3F. Rainfall and other weather conditions were not very favorable in this district. Wayland's total rainfall was above average for the state but precipitation periods were

smallest in number, particularly late in the growing season, resulting in reduced yields. Clarence had three dry periods, which reduced yields. Heavy rains in May delayed planting until June in both locations.

Table 3A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959), 1958, 1959 and 1960 in District 3.

	Farmland Planted to Corn (%)	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri Corn Yield Tests
10 year average 1950-1959	12.7	407,000	45.5	
1958	13.2	424,000	60.2	104.4
1959	19.4	621,000	56.6	108.4
1960	17.2*	551,000*	52.0*	79.9

\*Estimated as of October 1, 1960

## DISTRICT 4

The results for District 4 are given in Table 4A through 4F. Abnormal climatic conditions reduced yields in this district. The Higginsville location received below average amount of rainfall during the growing season

with less than 15 inches. That, with 51 days of temperatures above 90° and a 45-day dry period in July and August, and one of 20 days duration in August and September, resulted in reduced yields.

Table 4A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 4.

		Farmland Planted to Corn (%)	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri Corn Yield Tests
10 year Average	1950-1959	13.2	477,000	35.2	
	1958	10.4	376,000	53.0	90.9
	1959	14.3	518,000	52.6	79.3
	1960	13.5*	488,000*	55.0*	103.6

\* Estimated as of October 1, 1960

## DISTRICT 5

Results of District 5 trials are in Tables 5A to 5F. Though rainfall in this district was below the state average, yields were above average. The lowest rainfall oc-

curred at Columbia; Marshall and Cole Camp received less than the state average. Two dry periods at Cole Camp and Columbia tended to reduce yields.

Table 5A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 5.

	Farmland Planted to Corn (%)	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri Corn Yield Tests
10 year Average 1950-1959	8.8	565,000	40.4	
1958	7.8	496,000	55.0	115.3
1959	11.1	709,000	51.9	96.2
1960	10.5*	668,000*	56.0*	104.3

## DISTRICT 6

Tables 6A to 6F give results for District 6. This district had the highest yield in the state trials. Each location had below average rainfall, but precipitation was

very well distributed throughout the growing season. Heavy stalk lodging occurred late in the season at Moscow Mills but did not materially affect yields.

Table 6A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 6.

	Planted to Corn (%)	Farmland	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri

## DISTRICT 7

Results for District 7 are in Tables 7A to 7F. The rainfall records show that Mount Vernon and Carthage had slightly less than the state average rainfall. However,

yields at these locations were fairly high, in spite of the two dry periods at each place and above average number of days with temperatures exceeding 90°.

Table 7A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 7.

	Farmland		Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri
	Planted to	Corn (%)			Corn Yield Tests
10 year average 1950-1959	5.8		184,000	29.1	
1958	5.4		170,000	50.3	114.4
1959	5.9		189,000	47.0	108.3
1960	5.6*		178,000*	47.0*	106.3

\* Estimated as of October 1, 1960

## DISTRICT 8

Tables 8A to 8F give results for District 8. Abnormal climatic and other conditions reduced yields in this district. These were: (1) Rainfall was below average for the state and fewer rains occurred during the growing season. (2) There were two dry periods at Summersville and three at Ellington. (3) Summersville had a tempera-

ture of 90° or above for 42 days and Ellington had 66 days with high temperatures, compared with the normal of 32 days for both locations. (4) Stalk lodging was fairly high at Summersville due to corn borer infestation and excessive winds.

Table 8A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 8.

		Farmland Planted to Corn (%)	Total Corn Acreage	Avg. Acre Yield (Bu.)	Missouri Corn Yield Tests

## DISTRICT 9

District 9 results are in Tables 9A to 9F. The rainfall in this district was below the average for the state.

Sixty-seven days with temperatures above 90° (16 above average) reduced yields at Portageville.

Table 9A Percent of Total Farmland Area Planted to Corn, Total Corn Acreage, Average Acre Yield and the Average Acre Yield for Hybrids Tested in the Missouri Corn Yield Trials for the 10-year Period (1950-1959) 1958, 1959 and 1960 in District 9.

	Farmland		Total Corn Acreage	Avg. Acre Yield(Bu.)	Missouri
	Planted to Corn (%)				Corn Yield Tests
10 year average	1950-1959	14.5	356,600	40.1	
	1958	12.4	304,000	56.1	91.4
	1959	14.7	362,000	59.0	93.0

## THREE-YEAR PERFORMANCE RECORDS

Since the reorganization of the Missouri yield trials on a district basis in 1957, a number of hybrids have been tested for a 3 or 4-year period, either in a single district or in groups of districts. 1958, 1959, and 1960 results are reported in tables for the respective districts.

It should be emphasized that the results of tests for a period of more than 1 year are of greater value in selecting hybrids than any single year's results. However, if one must rely on results from any one year, it is best to use the average performance from as many testing locations as possible in the area where the hybrid is to be grown.

A 1958-1959-1960 summary of test results for hybrids grown in each of the nine districts is in Tables 10 to 13.

Pedigrees of all open-pedigree hybrids tested in 1960 are listed in Table 14.

Numerous new closed-pedigree hybrids were tested from 1957 through 1960 for the first time. The Missouri Agricultural Experiment Station does not make specific recommendations for these hybrids, but we do suggest that farmers growing a new hybrid for the first time try a small acreage to determine whether they like the hybrid before they plant a large acreage of it. This recommendation should be practiced for all new hybrids, whether of closed or of open-pedigree origin.

Table 15 gives the districts in which different hybrids were entered by commercial companies in 1960. Table 16 gives the districts in which different open-pedigree hybrids were entered.

**Table 10 1958, 1959 and 1960 Summary of Performance Records for Hybrids Tested in All Districts. Averages of 55 Tests.**

## Sources of Seed for Commercial Hybrids.

Hybrids	Firm	Address
Bear OK	Bear Hybrid Corn Co., Inc.	Decatur, Ill.
Cargill	Cargill, Inc.	Minneapolis, Minn.
Coker	Cokers Pedigreed Seed Co.	Hartsville, S. C.
DeKalb	DeKalb Agri. Assoc., Inc.	DeKalb, Ill.
Embro	Ed F. Mangelsdorf & Bro., Inc.	St. Louis, Mo.
Forster	Parks Forster Farm Seeds	Donnellson, Ia.
Funk	Funk Bros.	Bloomington, Ill.
Maygold	Earl May Seed Co.	Shenandoah, Ia.
McAllister	McAllister Seed Farms	Mt. Pleasant, Ia.
McMullin	McMullin Corn Sales	Sikeston, Mo.
MFA	MFA Seed Division	Marshall, Mo.
Morton	Roy A. Morton & Sons	Bowen, Ill.
Pfister PAG	Pfister Associated Growers	Aurora, Ill.
Pioneer	Pioneer Seed Corn Co., and Garst & Thomas Hybrid Corn Co.	Tipton, Ind. Coon Rapids, Ia.
Rist	Plainview Hay, Feed & Seed Farm	Humboldt, Nebr.
Schenk	Chas. H. Schenk & Sons	Vincennes, Ind.
Steckley	Steckley Hybrid Corn Co.	Lincoln, Nebr.
Stull	Stull Bros.	Sebree, Ky.
United Hagie	United-Hagie Hybrids, Inc.	Des Moines, Ia.

## COMPARISON OF HYBRIDS OF DIFFERENT MATURITIES

Hybrids of three maturities were tested at all locations in 1960. These were an early hybrid, Iowa 4376; a midseason hybrid, US 13; and a late hybrid US 523 W. The yield results for 1960 follow the same pattern as those for 1959, 1958, and 1957. See Figure 2 for summary of comparative yields for 4 years (1957-1960).

Where conditions were more favorable for high yields during the 4-year period, the spread in yield between maturities was greater, and the full season hybrids had about a 30-bushel yield advantage. With lower yields,

caused by less favorable growing conditions, there was less difference in yield between the three maturity groups. This is illustrated by the difference of less than 7 bushels for districts 1 and 4.

Apparently it is logical to plant hybrids that take advantage of as much of the growing season as the climate will permit in your region. However, the choice would be regulated if the objective in planting early-maturing hybrids was something other than yield.
