INTRODUCTION

- Previous research has suggested that both alcohol dependence and marijuana dependence are heritable
 - Furthermore, both clinical and general population studies have suggested a moderate to strong relationship between alcohol consumption and marijuana use
 - Although it is plausible that the association is attributable to underlying risk factors shared by both alcohol and marijuana, little research has examined this possibility using a genetically informative design
-

RESEARCH QUESTIONS

- What are the relative contributions of genetic and environmental factors to marijuana dependence and DSM-IV alcohol dependence in young adults?
 - To what extent are the genetic and environmental influences on marijuana and alcohol dependence the same?
-

SAMPLE

- 4955 individuals who completed a telephone diagnostic interview for the Australian Twin Study (“1989 cohort”)
 - Both members of 2087 twin pairs:

MZF=525	MZM=353	
DZF=415	DZM=296	DZO=498
 - Mean age=29.5 years (range: 23-35)
-

MEASURES

Marijuana, part 1

- 2906 individuals had tried marijuana
 - Mean age at first use = 18.9 years
 - Number of times used:
 - Mean = 168.8 • Median = 10 • Mode = > 1000
 - 50.9% 10 or fewer times
 - 10.9% 1000 or more times
-

MEASURES

Marijuana, part 2

- Marijuana dependence was based on four criteria:
 - Used more often or in greater amounts than intended (13%; n=387)
 - Needed more to obtain same effect as had felt initially (16%; n=453)
 - Continued to use even though knew it caused emotional and/or psychological problems (17%; n=486)
 - Wanted to cut down on use 3+ times in life (15%; n=430)
-

MEASURES

Marijuana, part 3

- Total number of marijuana dependence symptoms (of those who had tried marijuana):
 - 71% had 0 Sx (n=2074)
 - 11% had 1 Sx (n=315)
 - 8% had 2 Sx (n=222)
 - 6% had 3 Sx (n=183)
 - 4% had 4 Sx (n=112)
 - Marijuana dependence was defined as having three or four dependence symptoms
 - 10% of users met dependence criteria (n=295)
-

MEASURES

Alcohol

- Only 25 of the 4955 participants (<1%) were lifelong alcohol abstainers
 - 1070 respondents met DSM-IV criteria for alcohol dependence (3+ symptoms of 7 possible occurring within a 12-month period):
 - 28% had 0 Sx (n=1362)
 - 26% had 1 Sx (n=1263)
 - 22% had 2 Sx (n=1095)
 - 12% had 3 Sx (n=580)
 - 7% had 4 Sx (n=321)
 - 3% had 5 Sx (n=171)
 - 2% had 6 Sx (n=98)
 - 1% had 7 Sx (n=38)
-

RESULTS, 1

- Tetrachoric correlations provide an initial indication of familial influences on marijuana and alcohol dependence
 - Because the MZ correlations are larger than the DZ correlations for both men and women (see **TABLE 1**), there is evidence of genetic influence on both measures
 - Because the DZO correlations are similar in magnitude to the DZF and DZM correlations (see **TABLE 1**), there is not evidence of a gender difference in the genetic influences
-

TABLE 1:

Tetrachoric Correlations

Marijuana Dependence

MZF=0.57* (0.30 – 0.77)

DZF=0.28 (-0.12 – 0.61)

MZM=0.58* (0.30 – 0.78)

DZM=0.34* (0.03 – 0.60)

DZO=0.26 (-0.09 – 0.56)

Alcohol Dependence

MZF=0.56* (0.39 – 0.69)

DZF=0.38* (0.19 – 0.56)

MZM=0.51* (0.35 – 0.65)

DZM=0.26* (0.07 – 0.44)

DZO=0.26* (0.09 – 0.41)

* Indicates $p < .05$

RESULTS, 2

- Structural equation modeling was used to assess the significance of genetic and environmental influences on marijuana and alcohol dependence, and to assess the extent of genetic and environmental overlap
 - The bivariate genetic model used to assess genetic and environmental overlap between alcohol and marijuana dependence is shown in **FIGURE 1**
 - There was significant genetic influence on both alcohol and marijuana dependence (see **TABLE 2**)
 - The genetic overlap between alcohol and marijuana dependence was significant and substantial; environmental overlap was not significant (see **TABLE 3**)
-

FIGURE 1

A = additive genetics

C = shared environment

E = nonshared environment

r_A , r_C , and r_E are the genetic, shared environmental, and nonshared environmental correlations respectively

TABLE 2:
Proportions of Variance

	Alcohol Dependence	Marijuana Dependence
Genetic	0.46* (0.19 – 0.63)	0.56* (0.19 – 0.74)
Shared Environmental	0.07 (0.001 – 0.28)	0.04 (0.001 – 0.36)
Nonshared Environmental	0.46* (0.37 – 0.57)	0.39* (0.26 – 0.56)

* Indicates $p < .05$

TABLE 3:

Correlations between Alcohol and Marijuana Dependence

Genetic:	0.87* (0.40 – 1.00)
Shared Environmental:	-1.00 (-1.00 – 1.00)
Nonshared Environmental:	0.13 (-0.09 – 0.37)

* Indicates $p < .05$

CONCLUSIONS

- Both marijuana dependence and DSM-IV alcohol dependence are influenced by genetic factors ($h^2=0.56$ and 0.46 respectively)
 - There is evidence of substantial genetic overlap between marijuana and alcohol dependence ($r_A=0.87$)
 - Nonshared environmental influences on marijuana and alcohol dependence do not appear to be correlated ($r_E=0.13$)
-
