Substance Use Among Older Adolescents: A Latent Class Analysis

Sean D. Kristjansson Andrew C. Heath Andrey P. Anokhin

Introduction

- The use of alcohol, tobacco and illicit substances by adolescents is a major public health concern.
- Adolescents often use multiple substances concurrently.
- Prior studies have described heterogeneous profiles of concurrent substance use and abuse in adults.
- However, few studies have empirically identified the cross-sectional profiles of concurrent alcohol, tobacco and marijuana use in older adolescents.

Washington University in St.Louis

Goals of the present study:

- Use latent class analysis (LCA) to identify latent subgroups of adolescents defined by heterogeneous profiles of concurrent alcohol, tobacco and marijuana use.
- Identify risk factors associated with membership in the latent classes.

Hypotheses:

- 1. LCA would identify classes defined by distinct substance use profiles, including:
 - A low-risk class (minimal substance use).
 - One or more concurrent substance use classes.
- Classes defined by profiles of concurrent substance use would include higher proportions of members who:
 - A) Were male
 - B) Were White
 - C) Reported depression symptoms
 - D) Reported oppositional defiant disorder (ODD) symptoms

Washington University in St. Louis

Method:

Participants:

- 1500 Twins ascertained from the Missouri Twin registry.
- Mean Age: 18.3 years (Range: 17.4 19.6).
- Inclusion criterion: Not yet attending college (n = 1376).

<u>Assessments</u>:

- Semi-structured Interview for the study of the Genetics of Alcoholism (C-SSAGA), administered via telephone.
- Mailed self-report questionnaires.
- Assessed:
 - Demographic information.
 - Alcohol, tobacco and marijuana use histories.
 - DSM-IV depression and ODD symptoms.
- Data were collected near the end of the participants' senior year in high school.

Descriptive statistics:

Substance Use Variables: (dichotomous) $\frac{\% \text{ endorsed item}}{(\text{Total } n = 1376)}$

Ever had 1 drink	64.3 %
Had 1 drink on 24 or more days	29.1 %
Ever binge drank	
(males: 5 drinks in 24hrs. / females: 4 drinks)	45.9 %
Binge drank (within last year)	37.1 %
Binge drank (within last 30 days)	19.8 %
Ever smoked 1 cigarette	45.3 %
Smoked > 100 cigarettes	15.8 %
Ever used marijuana	30.7 %
Used marijuana > 20 times	11.3 %
Ever felt sick / vomited due to drinking	27.5 %
Ever blacked out due to drinking	13.4 %

Descriptive statistics:

Risk Factors: (dichotomous)

Total n = 1376 % of total

Washington University in St. Louis

SCHOOL OF MEDICINE

Gender (Male)	34.9 %
Race (White)	82.6 %
3 Depression symptoms	10.2 %
> 5 ODD symptoms	21.5 %

 ODD and Depression symptom counts were dichotomized because the distributions were skewed. Cut-offs were chosen to identify participants at relatively high risk for psychopathology.

Analyses:

- Latent class analyses were computed using Mplus 5.1.
- •The Bayesian Information Criterion (BIC) was used to determine the optimal number of latent classes.
- The LCAs computed the probabilities of class membership for each individual, and individuals were assigned to the class for which the probability of membership was highest.
- Risk factors were included in the LCAs as covariates. (latent classes were regressed onto the risk factors using simultaneous multinomial logistic regression).
- The covariate analyses tested for differences in the proportions of members in each class (relative to a reference class) who were male, white and who reported 3 depression symptoms and 5 or more ODD symptoms.

<u>Results</u>

- BIC indicated a 6-class model best fit the data.
- Classes are described according to the probability that the class endorsed each substance use variable (i.e., item endorsement probability profiles-substance use patterns).

Class Descriptions

- 1. Low-risk (n= 592): Minimal substance use.
- 2. Experimenter (n= 146): Tried alcohol, tobacco and marijuana.
- Occasional Binger (n= 203): Tried binge drinking, but tended not to use tobacco or marijuana.
- 4. <u>Regular Binger (n= 228)</u>: Binge drank regularly, tried tobacco and marijuana but had not progressed to regular co-use.
- <u>Smoker (n= 79)</u>: Used tobacco regularly, used marijuana frequently but did not binge drink regularly.
- 6. Polysubstance User (n= 128): Concurrent use of all substances.

Results: Item Endorsement Probability Profiles

Results: Risk Factors (covariate analyses)

Percentage of members in each class who:

A) Were male_B) Were WhiteC) reported at least 3 depression symptoms_D) reported 5 or more ODD symptoms

	<u>Low-risk</u>	<u>Experimenter</u>	Occasional Binger	<u>Regular</u> <u>Binger</u>	<u>Smoker</u>	Polysubstance <u>User</u>
<u>Covariate</u>						
A) Male	32.1%	32.9%	33.0%	37.3%	25.3%	54.7%
B) White	79.4%	55.5%	91.6%	94.7%	88.6%	88.3%
C) 3 Depression Symptoms	6.8%	13.7%	8.4%	14.0%	12.7%	17.2%
D) <u>></u> 5 ODD Symptoms	12.2%	28.8%	7.9%	26.3%	60.8%	45.3%

• For each covariate, one set of analyses tested for differences in the proportions in each of the classes relative to the Low-risk (reference) class.

Washington University in St. Louis School of Medicine

Results: Risk Factors (covariate analyses)

• For each covariate, another set of analyses tested for significant differences among the proportions in the experimenter, occasional binger, regular binger, smoker and polysubstance user classes.

Odds ratios that are <u>underlined</u> differ relative to the low-risk class (p < .05). Odds ratios (in rows) with different superscripts differ from each other (p < .05).

	<u>Experimenter</u>	<u>Occasional</u> <u>Binger</u>	<u>Regular</u> <u>Binger</u>	<u>Smoker</u>	Polysubstance <u>User</u>
<u>Covariate</u>					
A) Male	1.15 ^a	1.15 ^a	1.15 ^a	.74 ^b	<u>2.40</u> °
B) White	<u>.34</u> ª	<u>3.27</u> ^b	<u>3.27</u> ^b	<u>3.27</u> ^b	<u>3.27</u> ^b
C) 3 Depression Symptoms	<u>1.69</u> ª	<u>1.69</u> ª	<u>1.69</u> ª	<u>1.69</u> ª	<u>1.69</u> ª
D) ≥ 5 ODD Symptoms	<u>2.48</u> ª	.71 ^b	<u>2.48</u> ª	<u>11.88</u> °	<u>5.94</u> ^d

<u>**Results</u>:** Probability of being a member of the classes as a function of risk factor combinations.</u>

Discussion

- As expected, the LCA identified latent classes defined by minimal use (low-risk class) and concurrent use of all substances (polysubstance user class).
- Intermediate classes included experimenters, occasional bingers, regular bingers and smokers.
- Relative to the low risk class, depression symptoms were associated with a small risk (OR = 1.69) for membership in the intermediate and polysubstance user classes.
- The risk factors related to the highest probability for being in the <u>polysubstance user class</u> were male gender, White race and ODD symptoms.

Washington University in St.Louis

Discussion

- The risk factors related to the highest probability for being in the <u>smoker class</u> were female gender, White race and ODD symptoms.
- The risk factor related to the highest probability for being in the <u>occasional binger class</u> was White race.
- The risk factors related to the highest probabilities for being in the <u>regular binger class</u> were White race and ODD symptoms.
- The risk factors related to the highest probabilities for being in the <u>experimenter class</u> were non-white race and ODD symptoms.

Washington University in St.Louis

<u>Conclusion</u>

- The results suggest that heterogeneous profiles of concurrent alcohol, tobacco and marijuana use exist in the older adolescent population, and these profiles are associated with specific risk factors.
- Knowledge about the typological heterogeneity of substance users in this age group can aid in developing more targeted prevention and intervention strategies.
