The Designated Thesis Committee Approves the Thesis Titled Author recognition using Locality Sensitive Hashing \& Alergia (Stochastic Finite Automata)

By
Prashanth Sandela
APPROVED FOR THE DEPARTMENT OF COMPUTER SCIENCE SAN JOSÉ STATE UNIVERSITY

December 2015

Dr. T. Y. Lin, Department of Computer Science

## ABSTRACT

In today's world data grows very fast. It is difficult to answer questions like 1) Is the content completely written by this author, 2) Did he get few sentences or pages from another author, 3) Is there any way to identify actual author. There are many plagiarism software's available in the market which identify duplicate content. It doesn't understand writing pattern involved. There is always a necessity to make an effort to find the original author. Locality sensitive hashing is one such standard for applying hashing to recognize authors writing pattern.

## ACKOWLEDGEMENTS

I want to take to thank everyone who has contributed towards completion of my project. The journey towards the end of the project was fruitful, exciting and great learning procedure. Experience gained from the project will help me solve many problems in the future.

I would like to thank Dr. T.Y.Lin, my project advisor, for giving me this wonderful project and helping me to successfully complete this project and get a great insight about real time challenges and problems. Thanks for your attention and support. I would like to thank my committee members, Dr. Thomas Austin and Karthik Rajagopalan for support and patience.

I would like to thank Computer Science department for providing me opportunity and with the necessary material. I would like to thank everyone who has helped and guided me to successfully complete this project.

## 1. Introduction

There are many authors in today's world. This count keeps growing day by day. It is estimated that there are more than 20 Billion authors. Anyone who writes some content which may be a book or blog post or a blog comment is considered as an author.

With the growing authors and post or books, it is being increasingly difficult to track authors identity. Even now there are millions of documents without a recognized author. It is important to know the true identity of the author so that you might want to read more of his documents. With the increasing access to internet, it is very easy to duplicate particular content and hide the real author. There are many plagiarism software's available in the market but they can say if the content is original, they don't have the capability to identify author. There is really a necessity to have a model which tells the author. Our model should be able to identify author of the document.

The main basis to identify the pattern of the author is very different from other types of mining. For many types of data mining, we eliminate most of the stop words and special characters to make a sense out of data. For recognizing authors writing pattern we have to consider stop words and special characters, helps identify sentences. This can be achieved using many hashing algorithms of Locality Sensitive Hashing ${ }^{[1][2]}$ and using Stochastic Finite Automata Technique (Alergia Algorithm).

## 2. Locality Sensitive Hashing

Locality Sensitive Hashing ${ }^{[2]}$ reduces dimensionality of high-dimensional data. It has a hashing method which has high probability of mapping similar items to same buckets i.e., the total number of input items are much higher than the no. of buckets. This hashing is different from conventional hash functions and cryptographic hash functions coz it aims to maximize the possibility of like-items-collision. This Hashing is commonly used in data clustering and nearest neighbor search.

### 2.1. Definition

Locality Sensitive Hashing family ${ }^{[5][6][7]} \mathbf{F}$ is defined for metric space $\mathbf{M}$, an approximate factor
C and a threshold $\mathbf{R}$.

$$
\mathbf{M}=(\mathbf{M}, \mathbf{d}), \mathrm{R}>0, \mathrm{C}>1
$$

The $\mathbf{F}$ is a family of functions $\mathbf{h}: \mathbf{M}=>\mathbf{S}$ which maps to the elements of $\mathbf{M}$ to a bucket $\mathbf{s} \mathbf{\in} \mathbf{S}$.

Locality Sensitive Hashing family satisfies below conditions for $\mathbf{p}, \mathbf{q} \in \mathbf{M}$, using $\mathbf{h} \boldsymbol{\epsilon} \mathbf{F}$

- If $\mathbf{d}(\mathbf{p}, \mathbf{q}) \leq \mathbf{R}$, then $\mathbf{h}(\mathbf{q})$ equals $\mathbf{h}(\mathbf{p})$ i.e.., $\mathbf{p}$ and $\mathbf{q}$ collides with probability $>\mathbf{P}_{\mathbf{1}}$
- If $\mathbf{d}(\mathbf{p}, \mathbf{q}) \geq \mathbf{C R}$, then $\mathbf{h}(\mathbf{q})$ equals $\mathbf{h}(\mathbf{p})$ i.e.., $\mathbf{p}$ and $\mathbf{q}$ collides with probability $<\mathbf{P}_{\mathbf{2}}$

A family when $\mathbf{P}_{1}>\mathbf{P}_{2}$. Then this $\mathbf{F}$ is called $\left(\mathbf{R}, \mathbf{c R}, \mathbf{P}_{1}, \mathbf{P}_{2}\right)$

LSH is defined with universe $U$ with a similarity function $\rrbracket: \mathbf{U X U}->[\mathbf{0}, \mathbf{1}]$.

This locality sensitive hashing scheme is a family of $\mathbf{H}$ which are paired with probability distribution $\mathbf{D}$, such that a $\mathrm{h} \boldsymbol{\epsilon} \mathrm{H}$ chosen according to $\mathbf{D}$.

$$
\operatorname{Pr}_{h \in H}[\mathbf{h}(\mathbf{a})=\mathbf{h}(\mathbf{b})]=(\mathbf{a}, \mathbf{b}) \text { for any } \mathbf{a}, \mathbf{b} \in \mathbf{U}
$$

### 2.2. Applications

- Image similarity identification
- Hierarchical clustering
- Audio similarity identification
- Near-duplicate detection
- Genome-wide association study
- Audio fingerprint
- Nearest neighbor search
- Digital video fingerprinting
2.3. Hashing algorithms following Locality Sensitive Hashing
- Min-Hashing
- Sim-Hashing
- Hamming Similarity
- Angle Similarity

## 3. MinHash

MinHash ${ }^{[16]}$ hashing scheme is a technique to estimating similarity between two sets. MinHash is also known as Min-Wise Independent permutations of Locality Sensitive Hashing. Andrei Broder invented MinHash scheme. In the early stages of search engine, this scheme was used in AltaVista search engine to detecting duplicate web pages. MinHash has its application in largest-scale clustering documents or problems.

### 3.1. Jaccard Similarity and minimum hash values

The Jaccard similarity coefficient ${ }^{[16]}$ is also called Jaccard index. This is used to indicate similarity of two sets.

Let us consider 2 sets A and B.
$A \cap B=>$ intersection of 2 sets

A $\mathrm{UB}=>$ union of 2 sets.

Jaccard similarity coefficient can be defined as ratio of intersection and union of sets.

$$
J(A, B)=\frac{|A \cap B|}{|A \cup B|}
$$

The value of Jaccard similarity coefficient is strictly between 0 and 1 .
$\mathrm{J}(\mathrm{A}, \mathrm{B})=0$ if the sets are disjoint, (No common elements)
$=1$ if the sets are equal
$<=1$ if the sets have relatively more members in common.

The goal of MinHash is to quickly estimate $J(A, B)$ without performing any operations like union and intersection.

Let us assume a hash function $\mathbf{h}$. Let this map X and Y to distinct integers. Set Z defines $h_{\min }(Z)$ to be least member of $Z$ with regards to $h$ i.e.., the member $n$ of $Z$ with least value of $h(x)$. If $h_{\text {min }}$ is applied to X and Y , it can be observed that they get same values when elements of ( X U Y) with a minimum hash value which resides in $(\mathrm{X} \cap \mathrm{Y})$.
$\operatorname{Pr}\left[h_{\min }(X)=h_{\min }(Y)\right]=J(X, Y)$, This equation implies that this follows Locality Sensitive Hashing.

This implies that the probability of $h_{\min }(X)=h_{\min }(Y)$ is TRUE $==$ similarity $J(X, Y)$, provided sets $X$ and $Y$ are randomly choosen. So, if $r$ is the random variable then

$$
h_{\min }(X)=h_{\min }(Y) \text { and zero otherwise }
$$

then $r$ is unbiased estimator of $J(X, Y) . r$ can be used as estimator for Jaccard Similarity coz it has too high variance, the value is always either zero or one. The overall overview of MinHash scheme is to reduce this variance by calculating the average of several variables constructed in the same way.

## 4. Stochastic Finite Automata

In computer science and mathematics, the Probabilistic Automation(P) is generalization of non-deterministic finite automaton. This also includes converting probability of any given transition into a transition function. This turns into a stochastic or transition matrix. So, the probabilistic automaton generalizes concept of sub-shift of finite type or Markov chain. Thus, these languages are known as stochastic languages.

Finite automaton $\mathrm{A}=(\mathrm{S}, \mathrm{P}, \mathrm{i}, \delta, \mathrm{T})$ where
$P$ : finite input alphabet
$\delta:$ is a function: $\delta: \mathrm{S} \mathrm{x}$ A $->\mathrm{S}$. This is known as transition function.
$S$ : is a finite set known as set of states.

T : is subset of S known as terminal state.

Non-Deterministic Finite Automata(NDFA):

This type of automata has multiple acceptance state at any instance of time. Transition from one state to another state is possible in many number of states.

Deterministic Finite Automata Vs Non-Deterministic Finite Automata ${ }^{[13]}$ :

| Deterministic Finite Automata | Non Deterministic Finite Automata |
| :--- | :--- |
| Characterized as a 5 tuple state: | Characterized as a 5 tuple state: |
| S is the set of states | S, A, T, so, F> |
| A is the alphabet | S is the set of states |
| T is the transition function: | A is the alphabet |
| S $\times$ A $\rightarrow$ S | S is the transition function: |
| So is the initial state $\{\varepsilon\}) \rightarrow$ PS |  |
| F is the set of accepting states. | So is the initial state |

Table 1: Differences between Deterministic Finite Automata \& Non Deterministic Finite Automata

### 4.1. Alergia Algorithm

Alergia Algorithm is can be determined as Stochastic Finite State Transducer (SFST) ${ }^{[14][15]}$. We use Alergia Algorithm for our author pattern recognition. Below is the algorithm.

```
Algorithm Alergia
Input:
    S: sample set of strings
    \alpha: 1 - confidence level
Output:
    SFA
Begin
    A = stochastic prefix tree acceptor from S
    Do (for j = successor(first node(A) to last
    node (A))
            Do (for i = firstnode(A) to j)
                If compatible(i,j)
                Merge (A, i, j)
                Determinize(A)
                Exit (i loop)
            End if
            End for
    End for
    Return A
End algorithm
```

## 5. Function Words

Function words ${ }^{[8]}$ are words that have lexical meaning, which serves to express grammatical relationships with different words in a sentence, or specify mood or attitude of a speaker. In some cases, function words might also have ambiguous meaning.

In the phase of the project, the functional words are stop words. There are 261 function words which have been categorized into 7 different types by Stanford. These serve the purpose for differentiating among various stop words and for easy computation. Below is the list of function words with their equivalent weight.

Table 2: List of function words

| Sl. No | Function Word | Category |
| :---: | :--- | :---: |
| 1 | a | 3 |
| 2 | able | 1 |

| 259 | yours | 5 |
| 260 | yourself | 5 |
| 261 | yourselves | 5 |

Below are the sentences with the application of function words

Examples:

Sentence: "Function words ${ }^{[8]}$ are words that have lexical meaning, which serves to express grammatical relationships with different words in a sentence, or specify mood or attitude of a speaker"

Function word sentence: are that have little or have but instead to with other within a
Word category: 121621244434123243

Now the complete sentence has been converted to list of integers 12162124443412324
3. This list is used to identify authors pattern.

## 6. Dataset \& Environment details

### 6.1 Dataset details

The dataset I have chosen for this project is Novels written by different authors. These novels are available on internet and can be obtained for free for educational purpose. The size of the document gives a cutting edge to form clusters authors. Below are few numerical details about the dataset.

- Avg. no of lines in a document: $\sim 9 \mathrm{k}$
- Number of documents: 33
- Number of authors: 27
6.2. Environment details
- Processor: i7 $4^{\text {th }}$ Gen 2.40 Ghz
- RAM: 8GB
- Operating System: Windows 10
- Programming language: JAVA 64-bit
- Graphical Memory: 2GB Intel HD 4700 Graphics, 2GB NVIDIA 655M

## 7. Training \& Test datasets

Documents considered in the for training the model.

1. Adam Smith - An Inquiry into the nature.txt
2. Alexandre Dumas - The Count of Monte Cristo.txt
3. Arthur Conan Doyle -The Adventures of Sherlock Holmes.txt
4. Bram Stoker - Dracula.txt
5. Canan Doyle - A Study in Scarlet.txt
6. Charles Dickens - David Copperfield.txt
7. Charlotte Bronte - Jane Eyre.txt
8. Daniel Defoe - Robinson Crusoe.txt
9. Dante Alighieri - The Divine Comedy.txt
10. Edgar Rice Burroughs - A Princess of Mars.txt
11. Elliott Whithey - The Pirate Shark.txt
12. Frank Baum - The Wonderful Wizard of Oz.txt
13. Friedrich Nietzsche - Beyond Good and Evil.txt
14. Gabriel Garcia Marquez - Years of Solitude.txt
15. Harrison Williams - Legends of Loudoun.txt
16. J.K. Rowling - Harry Potter And the Order OF Phoenix.txt
17. J.K. Rowling - Harry Potter and Sorcerer's Stone.txt
18. Herbert George Wells - The War of the Worlds.txt
19. Herman Melville - Moby Dick.txt
20. Herman See;y - A Son of the City.txt
21. Hermann Hesse- Siddhartha.txt
22. James Joyce - Dubliners.txt
23. James Matthew Barrie - Peter Pan.txt
24. Jane Austen - Emma.txt
25. John Milton - Paradise Lost.txt
26. Jonathan Swift - Gulivers Traveles.txt
27. Joseph Conrad - Heart of Darkness.txt
28. Jules Verne - Around the World in Days.txt
29. Julia Ward Howe - From the Oak to the Olive.txt
30. Leo Tolstoy - War and Peace.txt

## Test document:

1. J.K. Rowling - Harry Potter and the Order OF Phoenix.txt

## 8. Applying Jaccard Similarity for author recognition

Considering two documents A and B documents written by same author. All the documents have different statements. Each document will have its statements. Below are the diagrams representing documents A and B.

Fig 1: Document A

Fig 2: Document B

The dots in both the documents represent statements in the document. This statements are represented by functional words. A data pre-processing step is involved before generating document trees. After this, the documents are verified to check for common statements among the documents. Below is the figure that represents common statements between different documents.

Fig 3: Identifying common statements

Total number of common statements $(\mathrm{A} \cap \mathrm{B})=3$

Total number of statement $(\mathrm{A} U \mathrm{~B})=13$

Jaccard Similarity $=(\mathrm{A} \cap \mathrm{B}) /(\mathrm{A} U B)=3 / 13$.

Now consider we have added a third document from same author.

Fig 4: Set of three documents

Total number of statements in documents $=(\mathrm{A} U B \operatorname{C})=17$

Total number of common statements $=(A \cap B)+(B \cap C)+(A \cap C)+(A \cap B \cap C)=6$

Jaccard Similarity $=(A \cap B)+(B \cap C)+(A \cap C)+(A \cap B \cap C) /(A U B U C)=6 / 17$

For improving the results, I have removed common statement in all the documents to improve the efficiency of the results. I did various trial to identify the minimum number of words in a statement. In the next page there are results for various variations in the minhash algorithm.

### 8.1. Results

Test Case 1: In this test case, we consider sentence as a sentence. This sentence is converted to function word category and Algorithm is applied. Below are the results of comparison.

Test Document: J.K. Rowling - Harry Potter and the Order OF Phoenix.txt

| SI. No | Document name | \% Match |

Table 5: Results for Jaccard Similarity for Test Case 3

## Conclusion

From the above results it can be observed that Jaccard Similarity doesn't give good matching results. In all the above 3 test cases, the results were negligible and doesn't follow any good pattern to come to proper conclusion. We can conclude that this method can't be used to identify the author of the document.

## 9. Applying Stochastic Finite Automata using Alergia Algorithm to

## recognize author

Below are the experimental results for a variety of Alpha values ranging from 0.1 to 0.95 by incrementing the value of alpha by 0.05

Test Case 1: In this test case, we consider sentence as a sentence. This sentence is converted to
function word category and Alergia Algorithm is applied. Below are the results of comparison.

Table 8: Representing Alergia results for Test Case 3

## Conclusion:

From the above test cases, we can say that Test case 2 doesn't make much sense for converting whole sentence into a paragraph and considering all the possible words. But Test case 1 and 3 does make sense as we shorten the paragraph by function words and which gives good results in identifying documents written by similar author.

## 10. Future Work

I would like to test this in cloud environment implementing the concept of computing grids or in big data environment. Also including various text processing techniques like stemming and lemmatization. I would also like to test this application with other algorithms like Alergia. This application might also be helpful to identify plagiarism.

## 11. Conclusion

Automata with Alergia builds a transition tree which represents the writing pattern of an author. This mechanism helps to identify the similarity between the documents. Based on this similarity we can determine the original author of a document with the $\%$ match. If the document size is too small the results may not be accurate but, as the document size increases there is high possibility that automata will give accurate result. Furthermore, this algorithm also helps to determine plagiarized content of a document. Using this algorithm, we were able to determine that harry potter author was recognized and the \% match with the document is high. So, use of Alergia algorithm does a good job of recognizing author of the document by developing the author writing pattern.

Where as in the experiment 2 using Jaccard similarity, which doesn't develop author writing pattern, but it does a good job of calculating distance between sentences. According to the initial ideology and assumptions, this result was supposed to show good match with similarity author. But, the results where negative based on the calculating distance between the sentences.

So, based on the above conclusion we can derive that experiment 2 using Jaccard Similarity can't be used for recognizing authors pattern and Automata with Alergia can be used for recognizing similarity between the documents and author.
