Child Welfare and TANF Implementation: Recent Findings

Summary

This report examines recent research findings about Temporary Assistance for Needy Families (TANF) implementation as it has affected the nation's child welfare system. The nation's program of cash aid for needy families with children (TANF) and its program to protect and care for children who are abused or neglected (child welfare services) are linked by history and share some of the same clients who have similar service needs. Assessing the full significance of the 1996 welfare reform law (P.L. 104-193) to the child welfare system is complicated by the 1997 enactment of the Adoption and Safe Families Act (P.L. 105-89), which made direct and major changes to the child welfare system, and by the fact that TANF implementation generally occurred during a strong economy.

Some child advocates were concerned that 1996 welfare reform initiatives – including time limits, family cap policies, and work requirements – might harm children and/or place new strains on the child welfare system. Research on the effect of TANF implementation has not produced conclusive findings. Changes in the size of the child welfare caseload have not been attributed to welfare reform, although certain work requirements may increase the incidence of child neglect.

Welfare reform also changed specific child welfare funding streams and renewed calls for stronger collaboration between child welfare and cash aid programs. Here too the evidence of an effect on the child welfare system is inconclusive. Greater collaboration has occurred in some locations and the flexible funding of TANF, combined with a strong economy and rapidly declining cash assistance caseload, meant new resources became available for child welfare services in some states. Child welfare administrators are concerned, however, that because this money is not dedicated to their agencies it may not always be available. Further, the 1996 welfare reform continues to base eligibility for federal foster care and adoption assistance on whether the family a child is removed from was (or would be) eligible for cash aid as it existed in prior law (Aid to Families with Dependent Children, AFDC). This increased the complexity of determining eligible federal foster care and adoption assistance costs and, as the 1996 income and resource standards become dated, might diminish federal child welfare funds by establishing a diminishing pool of children eligible for federally reimbursable assistance.

Finally, some child welfare advocates have also been concerned that children in families where no adult is receiving a TANF cash benefit (“child-only” cases) receive the necessary support, services and protection they require. The percentage of child-only cases has grown since enactment of welfare reform, although the actual number of these families being served has declined. Some states have used TANF funds to enact programs specific to the needs of child-only families, and many require involvement of child welfare agencies to access these new supports.

Child Welfare and TANF Implementation: Recent Findings

Introduction

Public cash assistance for needy families with children and public child welfare systems operate independently but share significant links. The 1996 Personal Responsibility and Work Opportunity Reconciliation Act (P.L. 104-193) repealed the prior cash aid for families program (Aid to Families with Dependent Children, AFDC) and enacted the Temporary Assistance for Needy Families (TANF) block grant. This change significantly altered how public cash assistance for families is offered and its implications for the public child welfare system are still being assessed; no clear picture has emerged. This paper examines survey and other research findings related to TANF implementation and its relationship to child maltreatment and use of public child welfare systems. It also discusses the importance of TANF to collaborative efforts between the family cash assistance and child welfare systems, changes in the child welfare funding landscape attributable to TANF, and the growth in the share of TANF families that receive a “child-only” benefit.

Background

Assisting *children* of needy sole-support mothers was the purpose of the nation’s cash welfare program for poor families when it was established in the 1935 Social Security Act. Both then and now, however, eligibility for aid rests a great deal on the circumstances of a child’s adult caregiver and federal reform efforts have focused on these adults. In 1950, Congress made caregivers of needy children eligible for federal cash aid (in addition to the children themselves) and as early as 1956 it amended the program to include purposes oriented to adult caregivers. Accordingly, the goal of family self-support joined the program goal of allowing children to be cared for in their own home (or the home of a relative). Over the next four decades reform efforts added employment, training and other services to the program to bolster this family self-support goal. These efforts culminated in the 1996 enactment of the Temporary Assistance for Needy Families (TANF) block grant.

TANF strengthened efforts to reduce dependence on government cash aid by requiring adult recipients to work and establishing time limits on their federal support. To the long-standing goals of self-support and care of children in their own homes, TANF added the goals of reducing the number of births occurring outside of marriage and encouraging the formation of two-parent families. Through all of these changes, however, responsibility for support of a child remained a condition of cash aid and in May 2002, the House passed TANF reauthorization legislation (H.R. 4737)

that would reassert the centrality of child well-being by making it the overarching aim of all four TANF purposes.

Federal support for state child welfare systems also grew out of the 1935 Social Security Act. The initial legislation provided funds to state public welfare agencies to ensure services in rural areas for the “protection and care of homeless, dependent and neglected children.” Eligibility for the services rested solely with a child’s need for care and protection. In 1962 (P.L. 87-543) Congress expanded funding authorization for child welfare services, required states to coordinate these services with their cash aid program to dependent children and their families, and sought to ensure child welfare services would be made available in all parts of each state (by July 1975). Also in 1962, Congress made permanent the provision of federal foster care assistance to children who were necessarily removed (by court order) from families receiving AFDC – TANF’s predecessor program.

Federal foster care assistance had first been authorized as a component of the cash aid program in 1961 and it remained a part of the AFDC program until 1980. In that year the Adoption Assistance and Child Welfare Act (P.L. 96-272) established foster care assistance as an independent program with its own set of state plan requirements. The 1980 law also created federal adoption assistance. In 1993, P.L. 103-66 established a new program and funds for child welfare services that focused on family preservation and support. The most significant change to the child welfare system since 1980, however, came with the 1997 enactment of the Adoption and Safe Families Act (P.L. 105-89). This law emphasizes the paramount importance of safety for children and seeks to increase permanency for foster care children by establishing strict time lines for achieving family reunification, adoption, guardianship or another permanent placement for a child.

How are TANF and Child Welfare Linked Today?

TANF policies are relevant to the well-being of *all* poor children and, because they are the most often served, especially those in single-parent families.¹ Child welfare services, by contrast, are designed for children who experience abuse and neglect and they can come from families of any income level or structure. Although the vast majority of children in cash aid families do not experience maltreatment, research shows higher rates of abuse and neglect among poor and single-parent families and many children in public foster care have been removed from families that receive cash welfare.² A 1995-1996 three-state study (California, Illinois, North Carolina) found that fewer than 3% of children on or recently removed from cash aid

¹ For discussion of research concerning outcomes among children in cash welfare households as a whole, see the *CRS Welfare Reform Briefing Book* page on *Research, Child Outcomes* [<http://www.congress.gov/brbk/html/ebwlf43.html>].

² U.S. Department of Health and Human Services. Andrea J. Sedlak and Diane D. Broadhurst, *Third National Incidence Study of Child Abuse and Neglect*. Washington, D.C. 1996.

were victims of maltreatment but that 60% of all children entering foster care were in families receiving (or recently receiving) cash welfare.³

Federal child welfare and cash aid policies are also linked by federal financing requirements. As noted, Congress first funded foster care payments for children as part of TANF's predecessor program, AFDC, and this aid was specifically for children who were removed from families receiving federally supported cash aid (P.L. 87-31).⁴ Eligibility for federal foster care assistance remained linked to AFDC even after Congress established this assistance as an independent program in 1980. And, although the 1996 welfare reform law repealed AFDC, it provided that eligibility for federal foster care assistance remains tied to children who are placed in foster families after initially being removed from families receiving (or eligible for) cash aid under AFDC (as it existed on July 16, 1996).⁵ Nationwide an estimated 55% of the foster care caseload is eligible for federal foster care assistance.⁶

What are the Concerns and Opportunities?

Some child advocates feared that TANF requirements – mandatory work participation, benefit loss (sanction) for failure to comply with work or other requirements, time-limited aid, and broad restrictions on aid to immigrants – would cause harm to children and would negatively affect the public child welfare system. At the same time, supporters of the welfare reform law argued that the changes, especially requiring work, would boost self-esteem among parents on welfare and improve their ability to parent and serve as role models for their young children.

Aside from the effect of the new law on children and the size of the child welfare caseload, enactment of TANF renewed calls for better collaboration between child welfare and cash aid agencies and some new initiatives have followed. The broad purposes of the TANF block grant, combined with a declining cash aid caseload, provided a potential source of flexible funds for child welfare services. The 1996 welfare reform law, however, continues to link federal reimbursement for foster care and adoption assistance to AFDC income and resource standards (as they existed on July 16, 1996). Beyond the complexity of documenting eligibility for these children, these increasingly dated standards ensure a diminishing pool of federally eligible children (and thus declining federal child welfare funds).

⁴ In 1961 the program was called Aid to Dependent Children but was changed to Aid to Families with Dependent Children in 1962 by (P.L. 87-543).

⁵ P.L. 104-193 originally set June 1, 1995 as the eligibility look-back date. Technical amendments made by P.L. 105-33 changed this date to July 16, 1996 and made that date effective as if enacted in P.L. 104-193.

⁶ U.S. Congress. House. Ways and Means Committee. *Green Book 2000*, Committee Print, Washington, D.C. p. 724.

Finally, a post federal welfare reform increase in the percentage of TANF families that are “child-only cases” (the amount of cash aid offered is for the child(ren) and no adult portion is granted), has raised new questions about the adequacy of care and services available to these children and their families.

Child Welfare Trends and Research Findings

Research studying the effect of welfare reform initiatives in child welfare has not yet produced a clear picture of changes.⁷ The fact that many states implemented “TANF-like” policies before the enactment of TANF in 1996 and the post welfare-reform passage of extensive federal child welfare policy changes (via the Adoption and Safe Families Act of 1997, P.L. 105-89) complicates the task of assessing the importance of federal welfare reform to changes in the child welfare system. Researchers also note that the implementation of TANF took place primarily in an expanding economy – when many low-skilled parents could find jobs – and that more time must pass before the implication of federal time limits on cash aid can be fully understood. Information now available to assess the meaning of TANF implementation to the child welfare system is drawn from survey data obtained primarily from child welfare workers, as well as some welfare recipients, and administrative data regarding child maltreatment victims, foster care caseloads, and welfare receipt. Some of the research looks exclusively at periods before welfare reform, but in these cases the researchers are studying specific locations where federal waivers allowed establishment of “TANF-like” policies. Available research varies widely in scope and methodology, and only one experimental study (using random assignment and a control group) has been done.

National data on child maltreatment and foster care. In CY2000 an estimated 879,000 U.S. children were found to be victims of abuse or neglect for an incidence rate of 12.2 child victims per every 1000 children. This is above the number (826,000) and incidence (11.8) of child maltreatment victims in CY1999 but below the CY1993 high of an estimated 1 million child victims with an incidence rate of 15.3. For CY2000 states also reported an increase in the percentage of child victims who experienced neglect, as compared to other kinds of maltreatment. The proportion of child victims experiencing neglect (including abandonment) rose from 58% in 1999 to 63% in 2000 while the proportion of children who experienced physical or sexual abuse continued to decline. Researchers do not yet know whether the 2000 data represent the start of a new upward trend in substantiated child maltreatment, particularly neglect cases, or are simply a single-year anomaly.⁸

Researchers believe the number of children in foster care has at least stabilized and perhaps declined in recent years. (Complete data is not yet available, and changes in the quality of state-reported data may have impacted the reported trend.) A preliminary HHS estimate puts the number of children in foster care on September 30, 2001 at 565,000. This compares to an estimated 581,000 children in care at the end of FY1999 and an estimated 556,000 children in care on September 30, 2000.⁹ The foster care caseload had previously grown in every year for at least two decades, with the sharpest growth occurring in the last half of the 1980s. From FY1996 through FY1999 the caseload rose as some 1,047,000 children entered foster care while considerably fewer, an estimated 941,000, left care (i.e., to family reunification, adoption, legal guardianship, emancipation, or other custody). As of June 28, 2002, new estimates for the number of entries, as opposed to exits, from the foster care system were not available. As a result, it is not possible to determine whether fewer children have entered foster care in recent years or whether the caseload decline is primarily attributable to a greatly increased number of children exiting the system.¹⁰

Survey findings about the child welfare caseload. A 2000 survey of 46 state child welfare administrators, conducted as part of the National Survey of Child and Adolescent Well-Being (NSCAW) reports that the majority said they were unsure of, or that it was too early to tell, the effect of TANF on the number and characteristics of their state child welfare caseload. Fifteen percent said there appeared to be an increase in the proportion of TANF families using prevention, child protective services (CPS) investigation, and ongoing or long-term child welfare services. (At least one state legislature mandates a CPS investigation of neglect for families sanctioned because of TANF violations and, in that state, the number of TANF families referred to CPS by TANF workers increased from 15 sanctioned families in 1998 to 59 in 1999.)¹¹

The Urban Institute compared the size of 1996 and 1998 child welfare caseloads in 12 states (AL, CA, CO, FL, MA, MI, MN, NY, NJ, TX, WA, WI) and found them relatively unchanged in each state (or that change was attributed to state or local legislation and events). In some locations, however, child welfare workers surveyed cited federal welfare reform as the cause for growth in particular kinds of child

⁹ See "Alert" online at [<http://www.acf.dhhs.gov/programs/cb/dis/afcars/cwstats.html>]. The caseload numbers for the last day of FY1999 and FY2000 are "interim" estimates. Interim caseload estimates are based on more and better data and so are more reliable than preliminary estimates. Not all data is available yet for FY2001 so the estimated size of the foster care caseload on the last day of FY2001 is a preliminary number.

¹⁰ Child welfare system concerns related to TANF implementation primarily predicted growth in the number of foster care *entries*. In the meantime many of the provisions of the 1997 Adoption and Safe Families Act, especially the emphasis on quickly finding permanency for children in foster care, were intended to ensure quick *exits* of children from foster care.

welfare cases. These included cases related to neglect or poverty (as opposed to physical abuse), and cases where a parent was a domestic violence victim or was ineligible for aid due to immigrant status. Overall, workers in six states reported an increase in abandoned children, which they attributed to stricter welfare requirements; workers in five states reported more referrals for “inadequate supervision,” due to parents working and using inadequate child care; and workers in five states reported an increase in maltreatment among immigrant children.¹²

Findings about child maltreatment and out-of-home placements.

A comparative analysis of state-level data related to welfare and child welfare policies from 1990-1998 suggests that certain policies, including benefit size and work requirements, may affect maltreatment rates and/or the number of out-of-home placements. This study’s strongest finding was that more generous welfare benefits are associated with significantly lower levels of neglect and smaller numbers of children in out-of-home care. (Or conversely, reduced benefits are associated with higher levels of neglect and larger numbers of out-of-home placements.) These researchers also report that family cap policies, which typically mean that a family’s benefit is not increased to meet the needs of an infant born 10 months or more after the family begins to receive cash aid, are associated with lower numbers of substantiated cases of maltreatment but increased numbers of out-of-home placements. Other findings from this research suggest that more single mothers working leads to increased child maltreatment (especially neglect).¹³

Other evidence of the effect of welfare reform on child maltreatment is mixed. An experimental study in Delaware also suggests a connection between strong work requirements and increased levels of child neglect. The Abt Associates evaluation of Delaware’s pre-TANF waiver program found higher rates of neglect (after 3 years) among families that were subject to strong work requirements and time-limited benefits (as compared to those subject to the old cash aid program).¹⁴ Researchers who used administrative data to study the effect of welfare reform on the incidence of child maltreatment among Illinois children entering AFDC/TANF, however, found a decline in reported child maltreatment after enactment of federal welfare reform. For children who received cash benefits in the years 1994-1996 (during which Illinois instituted a Work Pays program to encourage employment among adult welfare

recipients) the incidence of reported child maltreatment 1 year after first receiving cash benefits remained stable. But for children who first received cash aid in 1997 – after federal welfare reform was enacted – there was a 10% decrease in substantiated maltreatment cases; researchers expected this lower rate to hold for the children who entered the cash aid program in 1998.¹⁵

Benefit loss, child welfare involvement and speed of reunification.

A study comparing 187 Utah families who left TANF because of sanctions to 200 randomly selected Utah families who left for other reasons found the sanctioned families were no more likely than non-sanctioned families to have a child welfare case opened at some time within 3 years after their cash aid ended. Both groups, however, had a relatively high involvement with the child welfare system (20.3% and 22.6%, respectively). And among families with child welfare involvement, those that had been sanctioned were much more likely to have been found without adequate resources to support their families (67.6% compared to 28.9% of non-sanctioned families) and to have an open child welfare case at the *end* of the three years (21% compared to 2%).¹⁶

Separately, a Chicago area study that combined Illinois state administrative data and survey responses from 173 cash aid recipients (1995-1996) found that the odds of child welfare involvement were three times greater for respondents who had their benefits reduced by at least \$75 in a month and who did not have some employment income, as compared to those who experienced this benefit loss while maintaining some wage income. A study in Cuyahoga County, Ohio, however, found that for mothers whose children were already in foster care, employment might slow reunification. The study used administrative data to track the effect of income on the reunification of children who were placed in foster care before (n=378) and after (n=525) welfare reform. It found that pre-reform children were reunified at a rate that was 65% faster than the reunification rate for post-reform children. Although higher income was a significant factor in speeding reunification and post-reform children were more likely to have mothers with income from wages, reunification was slowed when earnings represented the greatest proportion of a mother's income.¹⁷

Collaboration and Funding

Federal child welfare law has for decades required states to coordinate their child welfare services with assistance and services provided by AFDC/TANF but this has not, historically, led to extensive collaboration. Enactment of federal welfare reform spurred calls for greater cooperation. This was true, in part, because the

¹⁷ Kathleen Wells, Case Western University and Shenyang Guo, University of Tennessee, Interim Report II, September 2001.

flexible funding of TANF made it potentially available for more child welfare uses and because of concerns that “dual-system” clients (those served by both child welfare and TANF) might have trouble simultaneously meeting requirements for TANF assistance, especially work participation, and child welfare case plan requirements (e.g., court hearings, child visits, or participation in substance abuse treatment, parenting skills training or other comparable activity).

Collaborative efforts. Three kinds of collaborative efforts have been identified. These are 1) front-line worker efforts to coordinate case planning of dual-system clients; 2) agency efforts to create programs that meet shared service needs regardless of whether a client is identified through a child welfare or TANF office (e.g., relative caregivers, teen parents, people needing mental health or substance abuse treatment); and 3) systemic efforts such as joint planning, co-locating workers, and cross-agency training. Obstacles to collaboration include: no shared information system between TANF and child welfare agencies (this might be a technical issue but can also raise confidentiality concerns for child welfare workers); heavy workloads for TANF and child welfare employees who often have different professional training, experience and priorities; no shared focus between agencies and their workers. (The primary attention in the TANF agency is usually adults while children are the central focus of child welfare agencies.)¹⁸ Other issues include concerns that TANF clients may have about child welfare intervention and restrictions TANF workers may have on working with families after a child has been removed from the home.

Urban Institute researchers found recognition of potential for collaboration in most of the 12 states and multiple county sites it visited in 1999 but many efforts were informal or just beginning.¹⁹ Basing their projections on a random sample of 92 county child welfare agencies surveyed in 1999-2000, the National Survey of Child and Adolescent Well-Being (NSCAW) determined that since the 1996 enactment of federal welfare reform more than one-third (38%) of all counties nationwide have created multi-program teams that include both TANF and child protective services (child welfare) workers. Other more intensive kinds of collaboration are less common. An estimated 22% of counties routinely refer TANF clients who experience benefit loss (sanctions) to child welfare services while an estimated 24% routinely link employment and child welfare services.²⁰

El Paso County, Colorado is frequently cited as a leader in collaborative efforts. Seeking to leverage available TANF funds for child welfare preventive purposes, county leaders created or merged a range of programs. These include joint family preservation and family support services (regardless of whether the initial social service contact was made through child welfare or TANF) and support and services

for relative caregivers, teen parents, families experiencing domestic violence, and others who may have cross-agency concerns. Other county efforts include cross-systems training on TANF and child welfare as well as substance abuse, mental health, and domestic violence issues.²¹

Collaboration initiatives in other parts of the country include a 2-year multi-county project in North Carolina that drew on many of the principles established in El Paso County, Colorado. Overall the North Carolina project sought to integrate the goals of family self-sufficiency and child well-being by creating a holistic focus on service to *families*. Among a range of activities it established regular communications between TANF and child welfare workers.²² And in California, a 4-year initiative to improve TANF and child welfare service links began with a spring 2001 survey intended to identify current practice. At that time, roughly half of the state's 58 counties required child welfare workers to determine if clients had a "possible need" for TANF services and about the same number had established steps that require TANF workers to determine whether a client is being served by child welfare. (However, most counties (37) lacked an information system that could display a client's child welfare status for the TANF worker.) Thirty-one of the counties indicated they had begun to implement coordinated case planning, although only six said this kind of case planning had been fully implemented.²³

Funding changes. The 1996 law that created the TANF block grant (P.L. 104-193) also made significant changes to child welfare funding. The cumulative effect of these changes on the amount of funding available for child welfare services and the kind of services offered is still being judged. In some instances it appears child welfare has received new funding, but because this money is not dedicated to child welfare purposes there is uncertainty about its availability in future years.

As part of the 1996 welfare reforms, Emergency Assistance funds (often used for child protective services among cash aid recipients) were folded into the larger TANF block grant. The 1996 law also placed new restrictions on children's eligibility for Supplemental Security Income (SSI). Many states apply for SSI on behalf of disabled foster care children and the benefit is used to offset the cost of maintaining custody of these children.²⁴ An Urban Institute survey comparing state

²⁴ The U.S. Supreme Court has agreed to hear a Washington state case (during its 2003 term) regarding the legality of this practice. In October 2001 the Washington State Supreme Court struck down the state's practice of claiming SSI and Social Security survivor benefits to
(continued...)

fiscal year spending in 1998 and 2000 found a 16% decline in foster care children who received SSI dollars.²⁵ In addition, the 1996 law reduced the amount of money available for the Social Services Block Grant (SSBG), another significant, non-dedicated, source of child welfare funds. At the same time, the federal law allowed states to transfer up to 10% of surplus TANF funds into the SSBG provided that money is used to serve children or their families who have income under 200% of the federal poverty line. Finally, as stated earlier, the welfare reform law continues to link a child's eligibility for federal foster care assistance to the prior cash welfare program, Aid to Families with Dependent Children (AFDC), with that program's eligibility standards frozen as they existed on July 16, 1996. As these standards become dated, the pool of children who are eligible for federal reimbursement of foster care or adoption assistance is likely to shrink.

In FY2000 states spent close to \$640 million in SSBG funds, or about 23% of their total SSBG expenditures, on four kinds of child welfare services – child foster care, child protective services, adoption and independent living services. Other child welfare related services, including case management, prevention/intervention services, residential treatment and counseling received additional and significant SSBG funding. Because of reduced SSBG appropriations, the level of SSBG funding for any purpose is increasingly dependent on large transfers of cash from TANF to SSBG accounts. In FY2000 approximately 37% of the total SSBG expenditures were made using dollars transferred from TANF accounts.²⁶ In sum, a number of factors that have made TANF funds available for SSBG expenditures – including a generally declining cash assistance caseload are in flux and could change in an economic downturn and/or as a result of certain legislative proposals. For instance, expanded work requirements, especially in a less robust economy with fewer entry level jobs in the private sector, might require states to increase their use of TANF funds in support of work activities or experience; likewise stricter work requirements could increase the demand for child day care and thus affect the ability of states to continue devoting an increasing proportion of SSBG resources for child welfare. At the same time some pending legislative proposals would increase overall appropriations for SSBG; these proposals could affect state decisions to transfer TANF dollars to SSBG accounts.

The 2000 NSCAW survey of 46 state administrators found that 25% of the administrators reported increased access to funding or services for child welfare programs since implementation of TANF. When new TANF funds or resources were available they were most often used to enhance or expand prevention and intervention services and out-of-home placements (including kinship care) for

²⁶ The amount of fiscal year state expenditures of SSBG funds is generally greater than the amount of funds appropriated in that fiscal year because states may transfer funds from other places, not least TANF. U.S. Department of Health and Human Services, *SSBG Annual Report: 2000*, in press.

children at risk of further maltreatment.²⁷ A number of the 12 states surveyed by the Urban Institute reported an increase in funding for child welfare services between 1996 and the present. TANF funds themselves were a notable part of child welfare spending in at least six of these states although administrators expressed concern that because these funds were not dedicated to child welfare they might not always be available. Texas expected to use \$64 million in TANF monies for foster care and adoption support payments in FY2001 (at least part of this money supplanted state funding). Minnesota used TANF funds to initiate a concurrent planning program that requires both family reunification and long-term placement plans to be established for all foster care children. In California, both Los Angeles and Alameda county officials reported fewer foster care children receiving SSI. Overall TANF funding for child welfare in California dropped dramatically in FY1998 to about a half million dollars (far below the \$87 million spent under Emergency Assistance 2 years earlier) but has since rebounded to \$167 million in FY2000.

Child-only and Relative Caregiver cases

Close to 1.4 million children lived in families that received child-only benefits in FY2000. Some child welfare advocates have expressed concern about whether these “child-only” TANF families (where no adult receives cash aid) have access to adequate resources and support services. Along with the rest of the TANF caseload, the number of families receiving child-only benefits declined from 978,000 in FY1996 to 782,000 in FY2000. However, because the decline in the percentage of child-only cases has been slower than the overall TANF caseload decline, child-only families now represent more than one-third of all cases (34.5% in FY2000). Child-only cases represented well below one-quarter of all cases before welfare reform (21.5% in FY1996) and this substantial percentage gain has helped to draw new attention to particular circumstances and needs of child-only families.²⁸

In child-only cases, the family may be headed by a relative (non-parent) caregiver – frequently a grandparent – who is income ineligible for aid or who chooses not to receive TANF cash aid because doing so would require compliance with work and other TANF requirements. Other kinds of “child-only” families include those where benefits to a child continue after they are ended for the adult(s) – due to time limits on aid or because of sanctions for failure to meet work or other TANF requirements. Child-only cases also include families where the adult head is ineligible for aid because of citizenship status or previous drug felony conviction. Finally, a child-only case may exist when the adult caregiver is a recipient of SSI.

Nationwide most child-only cases (62.4%) go to families where the child lives with a parent who is not receiving aid. But this national number hides a great deal of variation in the composition of an individual state’s child-only caseload. In close

²⁸ U.S. Department of Health and Human Services. TANF: Fourth Annual Report to Congress. X-192, Exhibit II, (Data in this report is for FY2000). May 2002 Some part of the growth in the proportion of child-only cases is due to states’ use of separate state programs, especially those for 2-parent families. When these cases are included in the overall cash aid caseload the proportion of child-only families drops to 33.0%.

to half of all states (24) more than 50% of the child-only cases involved children who lived with a nonparent caregiver, most often a grandparent.²⁹ The kind of sanction policies a state implements (e.g., does the state end the entire family's benefit for a violation, or does aid always continue for children), the availability of other state social programs to serve nonparent relative caregivers, and the size of a state's immigrant population are some of the factors that may affect a state's child-only caseload composition.

Relative caregivers. Grandmothers, aunts, and other relative caregivers have been a part of the cash welfare program for decades. More than half a million TANF children live with a kinship caregiver, although not all of these are in child-only cases.³⁰ Most children who live with their grandparents or other relatives do so on an informal basis but some are placed in relative families by child welfare workers who are seeking a safe home for the child.³¹ The 1996 federal welfare reform law encouraged formal relative placement by amending the law to require that child welfare agencies "consider giving preference to an adult relative over a non-related caregiver" when determining placement for a child who can no longer safely live with his/her parents. Relatives are to be deemed "fit and willing" prior to a formal placement by a child welfare agency, but many children live informally with relative caregivers.

Although children living with grandparents and other relatives often have needs comparable to children placed in non-relative foster homes, a TANF child-only case typically receives far less financial support than do children in foster care. A study using California's 1997 rate for "high cost" counties found that a relative caregiver receiving a TANF child-only grant to care for one child would receive \$279 a month while the basic rate for one foster care child ranged from \$345 to \$484, depending on the child's age, and many counties supplemented this basic rate with additional payments for specified needs (e.g., clothing allowance). In addition, foster care families may be eligible for supportive services and are also monitored to ensure a child's safety.³²

A Mathematica survey of child-only cases in New Jersey found that 60% of the nonparent caregivers reported that the child(ren) they care for did not live with a parent due to parents' substance abuse problems; 40% reported that child welfare services had required that the child not live with the mother and 58% reported that the child welfare agency had been "involved" with the parents or the child before the child came to live with them. The Mathematica survey also found that while, on average, nonparent caregivers had much higher incomes than TANF families that include a parent in the cash grant, the great majority (70%) have incomes below 200% of the poverty level. The average nonparent caregiver was 52 years of age but had considerably poorer physical health than residents of that age in the general U.S. population. Furthermore, despite relatively stable living arrangements, more children in these nonparent child-only cases scored less well on school achievement and behavioral measures than did children in TANF cases that included a parent in the cash aid grant.³³

In response to the growing number of relative caregivers and their specific needs, some states have used TANF funds to establish subsidized guardianship programs and/or kinship caregiver support groups and services. The advocacy coalition Generations United reported in June 2001 that as many as 24 statewide subsidized guardianship programs existed and that the majority access TANF funds to provide payments. These programs generally allow a non-parent caregiver (usually a relative) to assume legal custody of a child and to receive a subsidy equal to or somewhat less than foster care support but typically higher than a child-only TANF payment. Most states require that a child be under child welfare custody before a relative caregiver can have access to the subsidized guardianship program, however, and this significantly limits the scope of service benefit. (FL, LA and MO are the notable exceptions.) Some states require that the caregiver first access a TANF child-only benefit before receiving additional assistance, while as many as nine states simply used TANF funds to operate a subsidized guardianship program.³⁴

Child-only cases with parents. Child-only cases where a parent received SSI likely existed prior to the 1996 welfare reform law but changes made by the reform established several new kinds of child-only cases, including families where parents are ineligible for benefits due to citizenship status or sanctions, and these have been of particular concern to child welfare advocates. For FY2000, a little less than half of 782,000 child-only families (46.3%) included a parent who lived in the household. Of the parents who lived in these 349,000 families, the largest single group received SSI benefits (41.5%). Parents whose citizenship status was unknown represented 26.1% of these child-only cases, 11.5% were under benefit sanctions and 21% are categorized as "other/unknown."³⁵

³⁵ TANF Report FY2000, Table 10:11. **Note:** Sanctioned parents could also receive SSI (continued...)

The 1996 welfare reform law severely limited federal aid to legal immigrants who arrived in the United States after August 16, 1996 and have lived in this country for fewer than 5 years; citizen children of these immigrants, however, remain eligible for cash aid. The New Jersey study found that compared to children living in TANF families that included a parent in the assistance grant, as well as those living in other kinds of child-only cases, children of immigrant parents who received a TANF grant were many times more likely to experience extreme poverty (less than 50% of the federal poverty level). Research concerning the effect of this change on child welfare is limited. However, analysis of state level data between 1990 and 1998 did not find an association between the level of substantiated child maltreatment and availability of benefits to immigrants. At the same time, Urban Institute researchers note that in 5 of the 12 states they surveyed in 1999, workers reported an increase in maltreatment among immigrant children.³⁶

The 1996 welfare reform law also required states to sanction adults who failed to meet work and other requirements. Currently states have the option to reduce the family benefit by the amount of money that would otherwise be paid to the non-cooperating adult. In these cases a child-only case occurs because of the sanctions. Some states however require a full family sanction – meaning the entire grant is ended – and the House has passed welfare reform legislation (H.R. 4737) that would require full family sanctions in nearly every state.
