(Received 14 January 2010; accepted 15 January 2010; published online 4 October 2010)

A compendium of phase change enthalpies published within the period 1880–2010 is reported. Phase change enthalpies including fusion, vaporization, and sublimation are included for organic, organometallic, and a few inorganic compounds. This compendium is a combination of three previous series focusing on phase change enthalpies updated to 2009. Sufficient data are presently available for some compounds to permit thermodynamic cycles to be constructed, an important manner of evaluating the reliability of the measurements. Temperature adjustments of phase change enthalpies from the temperature of measurement to the standard reference temperature, $T=298.15$ K, are briefly discussed and a protocol for doing so is illustrated. © *2010 American Institute of Physics*. 1. Introduction

Transition enthalpy measurements, that include measurements of sublimation, vaporization, and fusion of organic compounds, have been reported for well over 100 years. These properties find use in a number of disciplines that include chemical and enviromental engineering, physics, and chemistry. The magnitude of these properties, when viewed

[a)]Electronic mail: jsc@umsl.edu

in perspective, provides valuable incite into the nature of both intra- and intermolecular interactions and thus are of interest to both experimentalists and theoreticians. While generally weaker than the chemical bond, the interactions responsible for these enthalpies are similar to those responsible for the self-assembly that occurs in everything from liquid crystals to biological systems.

The sheer number of measurements reported in the literature is testimony to the importance of these properties in providing an understanding of our physical world. One goal of this compendium is to bring together in one location measurements that often are scattered in the literature, sometimes in obscure places. Additionally, some of these measurements have significant errors associated with the property reported. These uncertainties are often not easily discernable, even to those familiar with the field. Despite significant improvement in instrumentation over the years, even recent measurements have errors significantly larger than reported. Provided all necessary transition enthalpies are available, an evaluation of the thermodynamic consistancy of the values reported is possible. This compendium is an effort to compile these phase change enthalpies in a manner such that an assessment can be made as quantitatively as the data permits.

Equation (1) is the thermodynamic equality that relates phase change enthalpies, fusion, vaporization, and sublimation enthalpies but only if all enthalpies are referenced to a common temperature. Since experimental fusion enthalpies measured at ambient pressures are confined to the temperature T_{fus}, this equality is only applicable at the fusion temperature unless each enthalpy can be adjusted for temperature. Since $T=298.15$ K is the usual temperature of reference, adjustment of each of these enthalpies to $T=298.15$ K is preferable. A number of methods, some experimental and others computational, have been used to adjust both vaporization and sublimation enthalpies to $T=298.15$ K. A number of these have been summerized in previous compilations [1987CHI, 2003CHI/ACR2, 1999CHI/NIC]. The relationships outlined in this compendium for adjusting sublimation and vaporization enthalpies, those most familiar to the authors, have been in use for some time and have given acceptable results. Fusion enthalpies have been adjusted by combining the relationships used to adjust vaporization and sublimation enthalpies. The protocol is described below,

$$\Delta_{sub}H_m(T) = \Delta_{vap}H_m(T) + \Delta_{fus}H_m(T). \quad (1)$$

2. Phase Change Enthalpies

As noted above, phase change enthalpies are temperature dependent. Therefore, to adjust a phase change enthalpy for temperature requires the heat capacity of the two phases in question. For sublimation enthalpies, while the heat capacity of the solid, $C_{p,m}$ (s, 298.15 K), may be available, the heat capacity of the corresponding gas phase value, $C_{p,m}$ (g, 298.15 K), is generally not. Similarly for vaporization enthalpies, the experimental heat capacity of the liquid at $T=298.15$ K, $C_{p,m}$ (l, 298.15 K), may be available, experimental data for the corresponding gas phase are usually lacking. For fusion enthalpies requiring both $C_{p,m}$ (s, 298.15 K) and $C_{p,m}$ (l, 298.15 K) for this adjustment, only one of these two properties is generally available at $T=298.15$ K. As a means of circumventing the lack of sufficient experimental data, empirical and theoretical relationships have been developed to adjust solid and liquid phase change enthalpies with temperature. Many of the phase change enthalpies reported this compilation have been adjusted to $T=298.15$ K by the authors. The reader should consult the original literature to determine how this adjustment was made. In cases where the phase change enthalpy is reported only at the mean temperature of measurement, a few empirical relationships that can be used to adjust each respective phase change are discussed briefly below.

2.1. Estimation of heat capacities

A number of methods have been developed for the estimation of heat capacities [1990LYM/REE, 1908KOL/KUK, 1993CHI/HES]. The method employed in this article is a method developed by the authors and shown to give reasonably good temperature adjustments when used in combination with the equations to be described below [1998CHI, 1999SAB/XU, 2008ROU/TEM]. The method is based on group contributions. The group values (Γ) used in the estimation of $C_{p,m}$(l, 298.15 K) and $C_{p,m}$(s, 298.15 K) are provided in Table 1. For reference, Figs. 1 and 2 provide an example of a hypothetical molecule containing all of these groups. Each group, identified numerically in column 2 of Table 1, can be located in these figures. Some estimations using examples taken from the recent literature are given in Table 2. Note that some of the group values in Table 1 remain tentative and values for a few groups are not available for both condensed phases.

The calculations for *t*-butylbenzene using the group values of Table 1 are fairly straightforward and require no additional comments. Agreement with experiment for the solid is good. Agreement between estimated and experimental heat capaci-

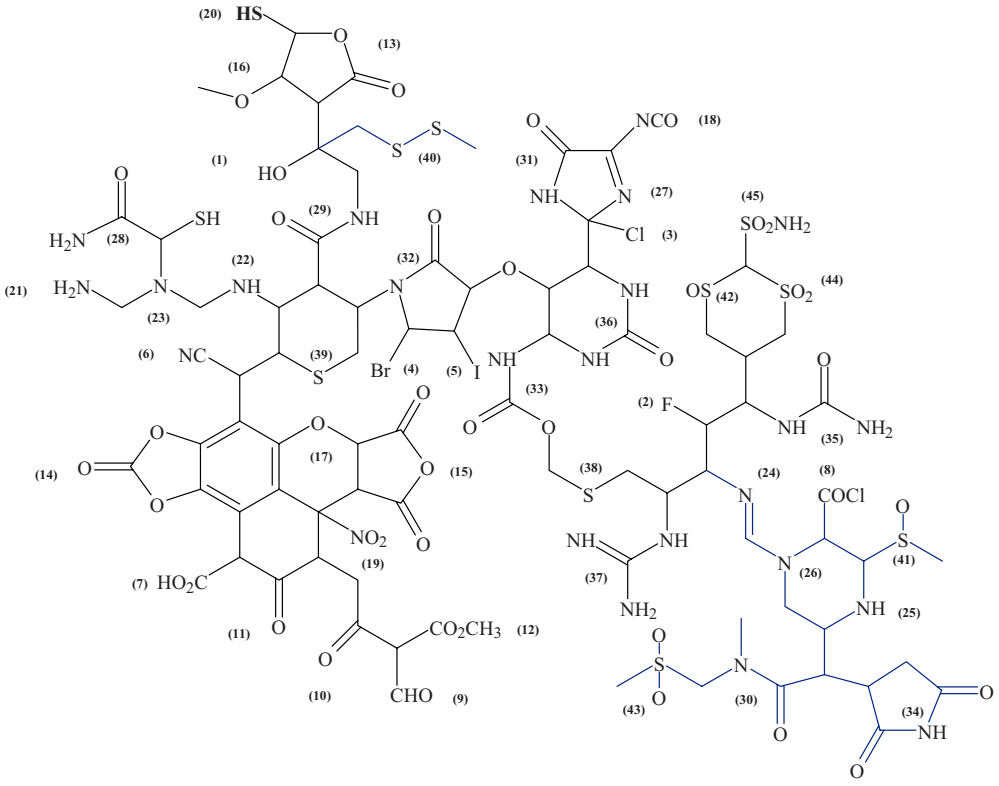

FIG. 2. (Color online) A hypothetical molecule illustrating the different functional groups defined in Table 1B.

ties for solid di-*tert*-butylbenzene also reported in the same article is not as good (estimated: 296.6; expt 347.8 J mol^{-1} K^{-1}) [2009CHI/STE].

Estimations of the heat capacity of 5-aminouracil are not as obvious. This compound can be modeled as containing two cyclic secondary amides, a cyclic tertiary and cyclic quaternary sp^2 carbon atom and a primary sp^3 nitrogen. Less intuitive models include modeling the ring as a cyclic urea and cyclic ketone or as a cyclic imide and cyclic secondary amine along with a cyclic tertiary and cyclic quaternary sp^2 carbon atom. All three of these estimations are illustrated in Table 2. All are in reasonable agreement with the experimental value [1907ZIE/SZT]. In this case, the less intuitive models give a slightly better agreement with experiment. Since group values for liquid cyclic ureas and cyclic imides are not available and cannot be used for the vaporization and fusion enthalpy temperature adjustments described below, the value for the more intuitive model should probably be used for fusion enthalpy adjustments. The heat capacity of 5-aminouracil can also be evaluted as its tautomer, 2,4-dihydroxy-5-aminopyrimidine. For comparative purposes, this estimation is also included in the table. In this case, the heat capacity of the solid is reproduced reasonably well but a larger discepancy is observed between the predicted heat capacities of the liquid. In addition to 5-aminouracil, the heat capacities of a number of other solid uracils are reported in the same article [1907ZIE/SZT]: uracil (estimated: 124.6; expt: 131.8); 6-aminouracil (estimated: 135; expt: 147.0), 6-amino-1-methyluracil (estimated: 177.9; expt: 166.2); 6-amino-1,3-dimethyluracil (estimated: 220.9; expt: 189 J mol^{-1} K^{-1}). The estimated values were calculated using two cyclic amides to model the uracil ring. The values differ slightly from those reported by the authors of the article who used the same method but different groups to model the tertiary and quaternary sp^2 carbon groups [1907ZIE/SZT].

Calculations for 2,9-dimethyl-1,10-phenanthrolene are fairly straightforward and in good agreement with the experimental heat capacity of the solid [2007BON/CAT]. The authors of this work also report the heat capacity of solid 1,10-phenanthrolene as 115 J mol^{-1} K^{-1} at T=298.15 K. The estimated value for the solid at this temperature is 201.4 J mol^{-1} K^{-1} (calculations not shown). In this case the experimental value appears to be remarkably small when compared to the estimated value and to the value of naphthalene, 165 J mol^{-1} K^{-1} (300 K), used as a standard.

Other group additivity methods of varying complexity have been reported for the estimation of $C_{p,\mathrm{m}}$(1,298.15 K). References for these and an alternative method for calculating heat capacities can be found in the recent work of Kolska *et al.* [1908KOL/KUK].

TABLE 1. Group values for estimation of liquid [Γ(l)] and solid [Γ(s)] heat capacity at T=298.15 K (values in brackets are considered tentative values)

2.2. Vaporization enthalpies

Equation (2) is an equation derived to model the differences in heat capacity between the liquid and gas phases [1993CHI/HOS]. It has been derived by correlating vaporization enthalpy differences measured at temperature T and generally at T=298.15 K with the heat capacity of the corresponding liquid at T=298.15 K for which reliable vaporization data are available. The vaporization enthalpy data used were obtained from the critical review and data compilation of Majer and Svoboda [1993CHI/HOS]. It has been found to provide satisfactory results for adjustments ranging from approximately T=500 to 250 K [1998CHI, 1999SAB/XU, 2008ROU/TEM]. The adjustments have been generally been applied from the mean temperature of measurement, $\bar{T}$, to 298.15 K. Adjustments for temperatures above T=500 K should be viewed with caution,

$$\Delta_{vap}H^{o}_{m}(298.15\ \mathrm{K})/\mathrm{kJ\ mol^{-1}} = \Delta_{vap}H^{o}_{m}(\bar{T}/\mathrm{K}) + \{10.58 + 0.26[C_{p,m}(l,298.15\ \mathrm{K})]/\mathrm{J\ mol^{-1}\ K^{-1}}\}\{\bar{T}/\mathrm{K} - 298.15\}/1000. \quad (2)$$

The term $[C_{p,m}(l)]$ (298.15 K)/J mol^{-1} K^{-1} refers to the mo-

lar heat capacity of the liquid phase at $T=298.15$ K; estimated heat capacities were used in deriving this relationship [1993CHI/HES]. Experimental values can also be used. An uncertainty of 16 J mol^{-1} has been associated with the bracketed term in Eq. (2). Some examples using Eq. (2) are given in Table 3.

2.3. Sublimation enthalpies

Sublimation enthalpies can also be adjusted to $T=298.15$ K from the mean temperature of measurement using a similar relationship, Eq. (3). This equation has also been derived by correlating sublimation enthalpy differences measured at temperature $\bar{T}$ and generally at $T=298.15$ K with the estimated heat capacity of each corresponding crystalline compound at $T=298.15$ K [1993CHI/HOS]. Unlike vaporization enthalpy data, much less critically evaluated sublimation enthalpy data are available. As a consequence, a larger uncertainty is associated with this adjustment,

$$\Delta_{sub}H^{o}_{m}(298.15\ \text{K})/\text{kJ mol}^{-1} = \Delta_{sub}H^{o}_{m}(\bar{T}/\text{K}) + \{0.75 + 0.15[C_{p,m}(\text{s},298.15\ \text{K})]/\text{J mol}^{-1}\ \text{K}^{-1}\}\{\bar{T}/\text{K} - 298.15\}/1000. \quad (3)$$

The term $[C_{p,m}(\text{s},298.15\ \text{K})]$ refers to the molar heat capacity of the solid phase at $T=298.15$ K. The relationship was derived using solid heat capacities estimated by the group additivity method described above [1993CHI/HES]. This equation has also been found to give satisfactory results for temperatures up to approximately $T=500$ K. Group values used in these estimations are also summarized in Table 1. As with heat capacities of the liquid state, experimental heat capacity values can be substituted for $C_{p,m}(\text{s},298.15\ \text{K})$ if available. When using Eq. (3), an uncertainty equal to one-third the magnitude of the total temperature adjustment should be assumed. While this uncertainty, arbitrarily chosen, is significant, some compensation is afforded by the fact that temperature adjustments of sublimation enthalpies are generally much smaller than the corresponding adjustments for vaporization enthalpies. In cases where the experimental sublimation enthalpy is reported by the author at $T=298.15$ K, the reader should consult the original literature to determine how the temperature adjustment was achieved. A number of different methods have been used in the literature for this adjustment and it has been found that some methods provide more thermodynamically consistent results than others when using Eq. (1) [1998CHI].

2.4. Fusion enthalpies

Temperature adjustments for fusion enthalpies from T_{fus} to $T=298.15$ K can be achieved by noting that if Eq. (2) is subtracted from Eq. (3), the heat capacity of the gas phase common to both cancels and the remainder results in the difference in molar heat capacity between the liquid and solid phases, $\Delta Cp(\text{cr},\text{l})$, Eq. (4). Equation (4) has been successfully used in combination with Eqs. (1) and (2) to predict sublimation enthalpies at $T=298.15$ K [2008ROU/TEM, 2004BAS/CHI]. An uncertainty equal to one-third the magnitude of the total temperature adjustment has generally been assigned to this temperature adjustment,

$$\Delta_{fus}H^{o}_{m}(298.15\ \text{K})/\text{kJ mol}^{-1} = \Delta_{fus}H_{m}(T_{fus}) + \Delta_{trns}H_{m}(T_{trns}) + [0.15C_{p,m}(\text{s},298.15\ \text{K}) - 0.26C_{p,m}(\text{l},298.15\ \text{K}) - 9.83][(T_{fus}/\text{K} - 298.15]/1000. \quad (4)$$

Many compounds do not exhibit solid-solid phase transitions at temperatures below fusion. For those compounds that do, the enthalpy of the transition also needs to be added to the fusion enthalpy when using Eq. (1) if the sublimation enthalpy was measured at temperatures below the transition temperature T_{trns}. If the sublimation enthalpy was measured above $T=T_{trans}$, the fusion enthalpy can be used directly in Eq. (1) to reproduce the sublimation enthalpy. If T_{trans} exceeds $T=298.15$ K, then the transition enthalpy will need to be added to the sublimation enthalpy to obtain $\Delta_{sub}H^{o}_{m}(298.15\ \text{K})$.

2.5. Sample phase change enthalpy adjustment to $T=298.15$ K

A few examples serve to illustrate the usefulness of Eqs. (1)–(4) when all three phase change enthalpies data for a particular substance are available. These are shown in Table 3. The first example, cyclohexanone, illustrates the use of these equations for temperature adjustments below ambient temperature. Cyclohexanone exhibits a solid-solid phase transition at a temperature below the temperature range used in the sublimation enthalpy measurement and hence is not included in Eq. (1). Since the heat capacity of the liquid generally exceeds that of the solid phase, adjustment to $T=298.15$ K in this case actually increases the fusion enthalpy from 1.3 to 3.0 kJ mol^{-1}. Three vaporization enthalpies have been reported, in good agreement with each other when adjusted to the reference temperature. The sublimation enthalpy, when adjusted to the reference temperature, is attenuated slightly, since the heat capacity of the solid generally exceeds that of the gas phase. The sublimation enthalpy, 48.2 ± 0.3 kJ mol^{-1}, is within experimental error of the mean value calculated using Eq. (1), 49.4 ± 0.8 kJ mol^{-1}. The uncertainty in the latter value is the mean uncertainty associated with each entry, and for one of the entries, the uncertainty associated with only the temperature adjustment.

Phenacetin illustrates a situation not uncommon with pharmaceuticals, the possible existence of polymorphism. The fusion enthalpy of phenacetin has been reported a number of times. Most reports are in reasonable agreement with each other except for one. In this case, the value is probably in error since the first and fourth fusion enthalpy entries, which are in disagreement, have been reported by the same research group. Ignoring the fourth value, an average value of 25.2 ± 1.8 kJ mol^{-1} is calculated, which when added to the

vaporization enthalpies results in two values, one of which appears to be in much better agreeement with a single determination of the sublimation enthalpy. The uncertainty in $\Delta_{fus}H^{o}_{m}(298\ K)$ only reflects the uncertainty in the temperature adjustments.

Carbazole is another example of a substance that exhibits a solid-solid phase transition. In this case the fusion enthalpy at $T=298.15$ T should include this transition since the sublimation enthalpy was measured at a temperature below the transition. A solid to liquid total phase change enthalpy of 15.6 ± 3.5 kJ mol^{-1} is obtained which when added to the vaporization enthalpy results in sublimation enthalpy values of 97.9 ± 5.1 and 91.8 ± 3.5 kJ mol^{-1}. In this instance, only one of the sublimation enthapy values calculated in this manner is consistent with the two sublimation enthalpies measured directly.

3. The Phase Change Enthalpy Compendium

The phase change enthalpy data reported in this compendium have been reported over the time period of 1880–2010. The data are combination of three compendia published in recent years and updated to the present [1902CHI/ACR, 2003CHI/ACR, 2003CHI/ACR2, 1999CHI/ACR, 1909CHI/ACR]. Vaporization enthalpies and sublimation enthalpies have been measured for many years and numerous techniques have been developed to do so. Generally, these techniques can be categorized into two groups, calorimetric techniques, in which the phase change enthalpy is measured directly, and techniques in which vapor pressure is measured directly or indirectly as a function of temperature. Providing on the experimental setup, calorimetric methods can also provide vapor pressures if an effusion cell is used. More recently, gas chromatographic techniques have also been developed to measure vaporization enthalpies. These techniques can provide both vaporization enthalpies and liquid

vapor pressures but since standards must be used, some care must be used in assessing their reliability. One technique, referred to as correlation-gas chromatography, has been shown to be successful provided standards are chosen with reliable values and appropriately related functional groups [2009LIP/HAN]. Fusion enthalpies have generally been measured by some form of calorimetry. These techniques are described by a number of acronyms used throughout the tables. A summary of these acronyms and their meanings can be found in Table 4.

In some cases, the vapor pressure–temperature data reported in the literature authors were analyzed by using the Clausius Clapeyron relationship, Eq. (5), where $C=0$, by the authors. The "Handbook of the Thermodynamics of Organic Compounds," by Stephenson and Malanowski [1987STE/MAL], was a useful source of vaporization enthalpy information provided in the form of Antoine Constants. Unfortunately, references to the original literature data are not provided by these authors. Vaporization enthalpies and some sublimation enthalpies were calculated from the A, B, and C constants reported in this compendium using Eq. (6),

$$\log_{10} p\ (\mathrm{kPa}) = A - B/(C+T), \tag{5}$$

$$\Delta_{\mathrm{vap}} H^{\circ}_{\mathrm{m}}(T_{\mathrm{m}}) = 2.303 \mathrm{R} B[\bar{T}/(\bar{T}+\mathrm{C})]^2. \tag{6}$$

Phase change enthalpies for organic compounds are reported in Tables 5–11. Organometallic compounds are reported in Table 12. Organometallic compounds are arranged alphabetically according to the metal.

In Tables 5–12, some enthalpy values are cited without a reference on the same line. The appropriate reference can be found with the next value with a reference (multiple enthalpy values were taken from the same source). In addition, in Tables 5–12, where a value is prefixed with a "U" (e.g., "U 66.0 ± 21.2"), this indicates unreliable data.

TABLE 4. Acronyms used in tables

A	calculated from the vapor pressure data reported by the method of least squares
AC	adiabatic calorimeter
B	calculated from the difference of the enthalpies of sublimation at temperature T and fusion at the melting point.
BG	Bourdon gauge
C	calorimetric determination
CATH	cathetometer
CGC	correlation-gas chromatography
CGC-DSC	combined correlation gas chromatography-differential scanning calorimetry
CR	Cryoscopy
DBM	dibutyl pththalate manometer
DM	diaphram manometer
DSC	differential scanning calorimeter
DTA	differential thermal analysis
E	estimated value
EB	ebulliometer
EM	electronic manometer
EV	evaporation
F	fluorescence
GC	gas chromatography
GCC	gas chromatography-calorimetry
GS	gas saturation, transpiration
GSM	glass spring manometer
HG	Heise gauge
HSA	head space analysis
I	isoteniscope
IP	inclined piston manometry
KG	Knudsen gauge
LE	Langmuir evaporation
MDSC	Modulated differential scanning calorimetry
ME	mass effusion-Knudsen effusion
MEM	modified entrainment method
MG	McLeod Gauge
MM	mercury manometer
MS	mass spectrometry
OM	oil manometer
PG	pressure gauge
QCM	quartz crystal microbalance
QF	quartz fiber
QR	quartz resonator
RG	Rodebush gauge
S-F	sublimation-fusion
SG	spoon gauge
SRFG	spinning rotor friction gauge
STG	strain gauge
T	tensiometer
TCM	thermal conductivity manometer
TE	torsion effusion
TGA	thermal gravimetric analysis
TSGC	temperature scanning gas chromatography
U	unreliable
UV	ultraviolet spectroscopy
V	viscocity gauge
VG	viscosity gauge

TABLE 8. Phase change enthalpies of C_9 to C_{10} organic compounds—Continued

Molecular Formula	CAS Reg No / Enthalpy	Compound / Temp (K) Range	$\Delta_{trans}H_m$ (kJ mol^{-1})	T_m (K)	Method	Reference
$C_{10}H_8O_3$	[90-33-5]	4-methyl-7-hydroxycoumarin				
	$\Delta_{fus}H$		29.14	460.7		[1996DOM/HEA]
$C_{10}H_9Br$	[2007844-51-7]	bromobullvalene				
	$\Delta_{fus}H$		14.2	317.2	DSC	[1998LUS/OLI]
$C_{10}H_9Cl$	[27576-94-9]	chlorobullvalene				
	$\Delta_{fus}H$		13.5	287.2	DSC	[1998LUS/OLI]
$C_{10}H_9Cl_2NO$	[2164-09-2]	N-(3,4-dichlorophenyl)-2-methyl-2-propenamide				
	$\Delta_{fus}H$		32.04	395.5	DSC	[1991ACR, 1990DON/DRE]
$C_{10}H_9Cl_3O_3$	[1928-39-8]	(2,4,5-trichlorophenoxy)acetic acid, ethyl ester				
	Δ_vH	(444–573)	76.4	459	A	[1987STE/MAL, 1999DYK/SVO]
$C_{10}H_9Cl_3O_3$	[1928-37-6]	methyl 2-(2,4,5-trichlorophenoxy)propionate				
	$\Delta_{fus}H$		31.95	360.6		[1991ACR]
$C_{10}H_9Cl_3O_3$	[93-80-1]	4-(2,4,5-trichlorophenoxy)butanoic acid				
	$\Delta_{fus}H$		30.28	386.7	DSC	[1991ACR, 1990DON/DRE]
$C_{10}H_9Cl_4NO_2S$	[2425-06-1]	N-[(1,1,2,2-tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide				
	$\Delta_{fus}H$		40.22	432.7	DSC	[1990DON/DRE]
	$\Delta_{fus}H$		43.1	432	DSC	[1969PLA/GLA]
$C_{10}H_9I$	[207844-52-8]	iodobullvalene				
	$\Delta_{fus}H$		15.5	376.2	DSC	[1998LUS/OLI]
$C_{10}H_9IO_2$	[122200-58-2]	methyl-4-iodocubanecarboxylate				
	$\Delta_{fus}H$		22.3	395		[2010GRI/TSA]
$C_{10}H_9N$	[91-63-4]	2-methylquinoline (quinaldine)				
	$\Delta_{fus}H$		12.52	270.5	AC,DSC	[2005CHI/STE]
	Δ_vH	(319–553)	62.6 ± 0.1	298	IP,EB	[2005CHI/STE]
	Δ_vH	(319–553)	61.0 ± 0.1	320	IP,EB	[2005CHI/STE]
	Δ_vH	(319–553)	58.2 ± 0.1	360	IP,EB	[2005CHI/STE]

		Note: the entry for Ref. [1990DON/DRE] may likely be in error. The authors give the name of the compound as 4,4′-dichlorobenzophenone in the paper; however, they give the CAS Registry number of [85-29-0] which corresponds to 2,4′-dichlorobenzophenone. The observed melting point temperature of 338.4 K is more in line with the melting point temperature of 2,4′-dichlorobenzophenone

	Note: The molecular structure of the compound given in the paper had a Cl group and only one CN functional group, which is different than the molecular structure given in Scifinder Scholar for Disperse Blue 165. The molecular formula for the structure in the paper is $C_{20}H_{21}ClN_6O_3$. The molecular weight given in the paper, 405, agrees with the molecular formula of $C_{20}H_{19}N_7O_4$. We have assumed that the chemical name is correct, but that the authors misdrew the molecular structure.

	$\Delta_{sub}H$		96.7			[1969DIL/KIS]
	$\Delta_{sub}H$		103 ± 13	298		[1968KIS/DIL, 2001DIO/PIE]
	$\Delta_{v}H$	(394–425)	71 ± 5			[2008ARU/MAT]
$C_{12}H_{16}Zr$	[1291-32-3]	*bis*(cyclopentadienyl)dimethylzirconium				
	$\Delta_{sub}H$		81.2 ± 2.1	298		[1982PIL/SKI, 1976KIR/TEL]
$C_{12}H_{36}N_4Zr$	[175923-04-3]	*tetrakis*(methylethylamino)zirconium (IV)				
	$\Delta_{sub}H$	(278–333)	79.4 ± 2.4		ME	[2009MON/NUT]
		Note: Authors state in the paper that the compound is a liquid at room temperature. Figure 3 in the paper shows that the plot of ln P versus 1/T is linear over the entire temperature range. The authors refer to the enthalpy as the enthalpy of sublimation. We have taken the value to be the enthalpy of vaporization given the authors' statement that the compound is a liquid. The compound's melting point temperature is unknown.				
$C_{16}H_{36}O_4Zr$	[na]	tetra-*tert*-butoxy zirconium				
	$\Delta_{v}H$	(374–587)	56.6	389	A	[1987STE/MAL]
$C_{20}H_4F_{24}O_8Zr$	[19530-02-0]	*tetrakis*(1,1,1,5,5,5-hexafluoro-2,4-pentanedionato)zirconium(IV)				
	$\Delta_{sub}H$	(333–363)	59.0		TGA	[2000FAH/BAR]
	$\Delta_{v}H$	(366–456)	48.6 ± 0.6	411	T	[1996MOR/SYS]
$C_{20}H_{16}F_{12}O_8Zr$	[17499-68-2]	*tetrakis*(1,1,1-trifluoro-2,4-pentanedionato)zirconium(IV)				
	$\Delta_{sub}H$	(373–403)	94		TGA	[2000FAH/BAR]

TABLE 12. Phase change enthalpies of organometallic and inorganic compounds—Continued

Molecular Formula	CAS Reg No Enthalpy	Compound Temp (K) Range	$\Delta_{trans}H_m$ (kJ mol^{-1})	T_m (K)	Method	Reference
	$\Delta_{sub}H$	(368–398)	133.6 ± 2.0	383	SMZG	[1996MOR/SYS]
	$\Delta_{sub}H$		118.7 ± 3.1	298	C	[1992RIB/FER2]
	$\Delta_{sub}H$	(383–438)	126.4 ± 1.7		GS	[1985MAT/KUW]
	$\Delta_{sub}H$	(383–438)	119.2 ± 1.7		GS	[1985MAT/KUW]
$C_{20}H_{28}O_8Zr$	[17501-44-9]	*tetrakis*(2,4-pentanedionato)zirconium(IV)				
	$\Delta_{sub}H$	(413–443)	126		TGA	[2000FAH/BAR]
	$\Delta_{sub}H$	(403–433)	138.8 ± 2	418	SMZG	[1996MOR/SYS]
	$\Delta_{sub}H$		125.8 ± 2.9	298	C	[1992RIB/FER2]
	$\Delta_{sub}H$		132.0 ± 6.8	463		[1987MUR/HIL2]
	$\Delta_{sub}H$		116 ± 34			[1984TRE/BER]
$C_{20}H_{44}O_4Zr$	[na]	*tetrakis*(1,1-dimethylpropoxy)zirconium				
	$\Delta_{v}H$	(392–426)	68	407	A	[1987STE/MAL]
$C_{20}H_{44}O_4Zr$	[na]	tetra-*tert*-pentoxyzirconium				
	$\Delta_{v}H$	(361–435)	74.1	361	A	[1987STE/MAL]
$C_{22}H_{20}Zr$	[51177-89-0]	*bis*(cyclopentadienyl)diphenylzirconium				
	$\Delta_{sub}H$		92.0 ± 4.2			[1976KIR/TEL]
$C_{24}H_{52}O_4Zr$	[na]	*tetrakis*(1,1-dimethylbutoxy)zirconium				
	$\Delta_{v}H$	(406–449)	93.3	421	A	[1987STE/MAL]
$C_{24}H_{52}O_4Zr$	[na]	*tetrakis*(1-methyl-1-ethylpropoxy)zirconium				
	$\Delta_{v}H$	(423–460)	91.4	438	A	[1987STE/MAL]
$C_{32}H_{40}F_{12}O_8Zr$	[56044-44-1]	*tetrakis*(1,1,1-trimethyl-5,5,5-trifluoro-2,4-pentanedionato) zirconium(IV)				
	$\Delta_{sub}H$	(408–449)	87 ± 1			[2008ARU/MAT]
	$\Delta_{sub}H$	(388–423)	134.9 ± 1.6	406	SMZG	[1996MOR/SYS]
$C_{44}H_{76}O_8Zr$	[18865-74-2]	*tetrakis*(2,2,6,6-tetramethylheptan-3,5-dionato)zirconium(IV)				
	$\Delta_{trs}H$		11.6	446		
		Note: value also includes the enthalpy of the solid/solid transition at 438 K				
	$\Delta_{fus}H$		5.7	616	DSC	[2008ZHE/MOR]

1984BOU/FRI T. Boublik, V. Fried, and E. Hala, *The Vapour Pressures of Pure Substances: Selected Values of the Temperature Dependence of the Vapour Pressures of Some Pure Substances in the Normal and Low Pressure Region*, 2nd ed. (Elsevier, Amsterdan, 1984). The vaporization enthalpies were calculated from the vapor pressures obtained from the Antoine constants reported in this compendium. In cases where the Antoine constant C=0, the Antoine Equation ($\log_{10}$ P=A−B/(C+T)) reduces to the integrated form of the Clausius Clapeyron equation directly. This was the case for many vaporization enthalpies. In those cases where C=0, the vaporization enthalpy was calculated as $\Delta_{vap}H_m(T)$=2.303 R B[T/(T+C)]2.

1987STE/MAL R. M. Stephenson and S. Malanowski, *Handbook of the Thermodynamics of Organic Compounds* (Elsevier: New York, 1987). The data in this listing were obtained directly from this compendium which does not contain literature references. The sublimation enthalpies were calculated from the vapor pressures obtained from the Antoine constants reported in this compendium. In cases where the Antoine constant C=0, the Antoine Equation ($\log_{10}P=A-B/(C+T)$) reduces to the integrated form of the Clausius Clapeyron equation directly. This was the case for most sublimation enthalpies. In those cases where this condition was not met, vapor pressures were calculated over a 30 K temperature range closest to $T=298$ K and the temperature dependence was reformulated in terms of the integrated form of the Clausius Clapeyron equation.

1999DYK/SVO J. Dykyj, J. Svoboda, R. C. Wilhoit, M. L. Frenkel, and K. R. Hall, *Vapor Pressure of Chemicals: Part A. Vapor Pressure and Antoine Constants for Hydrocarbons and Sulfur, Selenium, Tellurium and Hydrogen Containing Organic Compounds* (Springer, Berlin, 1999). The vaporization enthalpies were calculated from the vapor pressures obtained from the Antoine constants reported in this compendium. In cases where the Antoine constant C=0, the Antoine Equation ($\log_{10} P = A - B/(C+T)$) reduces to the integrated form of the Clausius Clapeyron equation directly. This was the case for many vaporization enthalpies. In those cases where this condition was not met the vaporization enthalpy was calculated as $\Delta_{vap}H_m(T) = 2.303RB[T/(T+C)]2$.

2003PER/BAU G. L. Perlovich and A. Bauer-Brandl, Pharm. Res. **20**, 471 (2003). [Note: the authors calculated the ideal mole fraction solubility of $x=0.0311$ at 298.2 K using their previously published enthalpy of fusion data, which was presumably reported previously (Ref. [2001PER/BAU]). The referenced paper does not contain the experimental enthalpy of fusion data. The enthalpy of fusion value for acetylsalicylic acid was calculated using the thermodynamic relationship: $\ln x = -\Delta_{fus}H_m(T)(T_{fus}-298.2)/(8.314 \times 298.2 \times T_{fus})$.]

2003PER/CON S. Perisanu, I. Contineanu, M. D. Banciu, J. F. Liebman, B. S. Farivar, M. A. Mullan, J. S. Chickos, N. Rath, and D. M. Hillesheim, Thermochim. Acta **400**, 109 (2003).
