ABSTRACT

This report describes the results of a Cooperative Research and Development Agreement (No. 01179W) between Sandia National Laboratories and Kaiser Permanente Southern California to develop a prototype computer model of Kaiser Permanente's health care delivery system. As a discrete event simulation, SimHCO models for each of 100,000 patients the progression of disease, individual resource usage, and patient choices in a competitive environment. SimHCO is implemented in the object-oriented programming language C++, stressing reusable knowledge and reusable software components. The versioned implementation of SimHCO showed that the object-oriented framework allows the program to grow in complexity in an incremental way. Furthermore, timing calculations showed that SimHCO runs in a reasonable time on typical workstations, and that a second phase model will scale proportionally and run within the system constraints of contemporary computer technology.

This report is published as two documents: Model Overview and Domain Analysis. A separate Kaiser-proprietary report contains the Disease and Health Care Organization Selection Models.

DISCLAIMER

INTRODUCTION

This report is Part 2 in a series of two reports describing the results of a Cooperative Research and Development Agreement between Sandia National Laboratories and Kaiser Permanente of Southern California to develop a prototype computer model of Kaiser Permanente's health care delivery system. The two documents are Model Overview and Domain Analysis. A separate Kaiser-proprietary report contains the Disease and Health Care Organization Selection Models.

DESCRIPTION OF SPECIFICATION FORMAT

This section describes the format of the class specifications that constitute the bulk of this document. The class specifications are organized into *clusters*; each cluster is a group of classes which are closely related to each other in some way. Within a cluster, the classes are categorized as *abstract*, *mutable*, or *immutable*. Abstract classes specify a class interface, that is the features and operations of a class, but do not specify any implementation of those features. A mutable representation specifies an implementation of an abstract class which has additional features that allow an instance of the class to be changed once it has been created. Immutable representations specify an implementation which can not be changed.

Whether abstract, mutable, or immutable, each class is specified by filling in the following specification template:

Class < NAME>

Description:

<description of purpose and defining characteristics of the class>

Specializes: <TYPE> <description of the more general class and its role in the current class> Aggregates: <part>: <TYPE> <description of the component class and its role in the current class> Operations: <operation>: <RESULT TYPE> Purpose: <description of the purpose of the operation> Require: <conditions which must be true before the operation can be invoked> Algorithm: <pseudocode for operation> Ensure: <conditions which are guaranteed to be true after the operation completes> Invariants: <invariant name> <condition which is guaranteed to be true at all times after the creation of an instance of the class, except while an operation is actually executing> Comments: <comment topic> <text of comment>

The Specializes section contains one parent clause for each class which the current class inherits. The Aggregates section contains one part clause for each part or component of the current class. Similarly, the Operations, Invariants, and Comments sections each contain as many operation, invariant, and comment clauses, respectively, as needed.

The *Invariant* section, and the *Require* and *Ensure* subclauses of the *operation* clause provide a precise method for specifying the intended operation and behavior of a class without actually implementing it. As described in the template above, these clauses provide conditions, written as precise logical expressions, which the class must satisfy. These conditions can be used both when reviewing the specification for correctness and when programming code to implement the specification.

GENERAL

The document constitutes a reorganization and translation of several Kaiser domain analysis documents [i, ii, iii] into an initial object-oriented analysis and design specification.

General design issues

Cost tracking and accounts.

Every component has cost tracking associated with it. Hence we need to design some general accounting method that is integrated into the components in some very uniform way. We've tentatively adopted the following mechanism. Costs are associated with resources. Each resource has four types of costs associated with it: aquisition cost, usage cost per unit of capacity, time cost per unit of time, and liquidation cost. Each resource has a usageCost function that calculates the cost for a usage instance. Each resource has one rate account and one cumulative account that track the costs associated with the resource.

Each resource has one or more procedures that it can perform and each procedure posts a transaction representing the value flows associated with the procedure. In general, resources are aggregate objects with other resources as parts and, in general, the procedures of the aggregate invoke the procedures of the parts. Each resource thus need account only for its own intrinsic costs; the parts will take care of thier own costs. To account for its costs, the resource must post a transaction representing the flow of value from the resource to the user of the resource, which is typically the patient. For single user resources, such transactions are thus binary transactions, i.e. they have a single source, the resource, and a single destination,

the user of the resource. The standard process for accounting is thus that when usage of a resource begins, the time is recorded and when usage ends, the usageCost function is invoked and the usage transaction posted. This pattern is part of every procedure, even if not explicitly stated in the specification of the procedure. For more details see class RESOURCE and the discussion and specifications in the ACCOUNT cluster.

Procedures and Interventions

Procedures and interventions are central activities in the function of the health care organization, but they are not objects. They are actions taken by the various objects in the model and thus they appear as operations of the relevant objects. For instance, the anti-tobacco education intervention is something that a physician (among other objects) does, hence the PHYSICIAN class has a giveAntiTobaccoEducation operation. In general, procedures and interventions take place in some facility and require coordinated behavior among various resources - patients, physicians, other personnel. equipment, supplies, drugs, etc. A given intervention may thus appear as an operation on several of the resources involved. In the case of anti-tobacco education, the giveAntiTobaccoEducation operation appears in both the PHYSICIANS OFFICE class and the PHYSICIAN class. PHYSICIANS OFFICE.giveAntiTobaccoEducation ensures that various resources (e.g. the doctor, the patient, handouts, etc) are available, then passes them to PHYSICIAN.giveAntiTobaccoEducation, which performs the intervention. This is the typical structure. For more details, see the specification for PHYSICIAN and PHYSICIANS OFFICE

SYSTEM CLUSTER

Abstract classes

Class REGION

Description:

The geographical region of interest, including its physical, environmental, economic, and demographic features.

Specializes:

None

Aggregates:

boundary: GEOGRAPHIC BOUNDARY

The boundary of the region

people: POPULATION

The human population of the region

healthCare: HEALTH CARE SYSTEM

The health care system of the region

environmentalHealthFactors: <TYPE>

Some collection of regional features which influence the health of the population of the region. To be specified.

financialFactors: <TYPE>

Some collection of regional features which influence the finances of the region. To be specified.

jobFactors: <TYPE>

Some collection of regional features which influence jobs in the region. To be specified.

Operations:

Invariants:

Comments:

Environment

The environmentalHealthFactors, financialFactors, and jobFactors features are just place holders for whatever specific features are eventually identified for class REGION. This feature corresponds to the category "External Environment" in KDA5.2. See also feature demographicFactor in class POPULATION

Class HEALTH CARE SYSTEM

Description:

The general, abstract health care system Specializes:

None

Aggregates:

people: POPULATION

The population the health care system serves, presumably the population of the region. See comment below.

groups: SET[EMPLOYER_GROUP]

The collection of employer groups in the health care system. See comment below.

hcos: SET[HEALTH_CARE_ORGANIZATION]

The collection of HCOs operating in the region.

regulators: SET[REGULATOR]

the collection of regultors in the region.

suppliers: SET[SUPPLIER]

The collection suppliers to the health care system. Includes banks, which supply financing.

Operations:

Invariants:

Comments:

Other Groups

KDA5.2 defines general groups as, roughly speaking, arbitrary sets of people. General groups then seem to be separated into two categories: employer groups and groups

POPULATION CLUSTER

Abstract classes

Class POPULATION

Description:

A human population.

Specializes:

SET[PERSON]

The general, abstract set of PERSON objects.

of people which meet some specification (e.g. age < 30). An employer group is certainly an object with identity and behavior and hence I've specified an EMPLOYER_GROUP class. It's not clear to me that entities of the other category have identity, existence and behavior. Their more like results of a query - just a container full of references to people that match the query specification.

Population

The population in the region and the population in the health care system are distinct. Do we want to bind them together with an invariant?

Mutable representations
Immutable representations

Aggregates:

demographicFactor: DISTRIBUTION_FUNCTION

Some statistical feature of the population. See comment below.

Operations:

Invariants:

Comments:

Features and distributions

Whatever features we define for PERSON (see below) conceptually propagate to the population as distribution functions. In addition, KDA5.2 states that there are "environmental health factors" and "demographic factors", but does not specify an explicit set. These unspecified features presumably appear as externally imposed distributions on the population. We need to detial these features.

Class PERSON

Description:

The abstract, general human being Specializes:

ACCOUNTABLE

The general object which can store value.

Aggregates:

name: NAME

address: ADDRESS

hcoMembership: HCO

The health care organization the person belongs to.

employerGroup: GROUP

The employer group the person belongs to.

coverageType: COVERAGE_POLICY

The type of coverage policy the person has.

healthCare: ACCOUNT

The health care value received by the patient.

income: MONEY

The annual income of the person.

language: STRING

The language the person speaks

age: INTEGER

The age of the person (in sec?)

gender: ENUM {MALE, FEMALE}

the gender of the person

familyHistory: <TYPE>

The family history of the person.

cvdPredisposition: REAL

The predisposition to coronary artery occlusion. Operations:

getExamination: EXAM_RECORD

Purpose:

Receive medical examination

Require:

None

Algorithm:

GROUP CLUSTÉR

Abstract classes

Class GROUP

Description:

The general, abstract employer group.

idetnifers. The latter is gerneally the better policy, but requires some specific choice. I'll assume the latter.

Values of characterisitics

I interpret the value types given in the KDA as follows: "dichotomous" and "categorical" either as specific types (RACE) or as ENUMERATED; "counts" as INTEGER; "continuous" as REAL.

Static versus variable characterisites

All features are variable in principle. If no operation specifically changes them, they are static.

Family history

How do we represent family history? Doesn't genetic predisposition subsume family history?

Mutable representations Immutable representations Specializes:

Invariants: Comments:

Revenues, expenses, balances and accounts

I've specified a single layer of aggregate financial features. In principle, there should be some chart of accounts and all the usual accounting machinery. How little can we get away with?

MEDICAL GROUP CLUSTER

Abstract classes Class MEDICAL GROUP

Description:

The medical group component of a health care organization; provides physicians to the HCO Specializes:

ACCOUNTABLE

The general object which can store value. Aggregates:

staff: SET[PHYSICIAN]

The medical staff of the medical group.

productivity: REAL

The (average?) number of patients seen per outpatient hour.

Financial policies

I've not specified any feature for financial policies because it's not clear how to deal with them.

Groups

Shouldn't HEALTH PLAN have a feature groups:SET[GROUP]? Aren't rates specific to group? Mutable representations Immutable representations

revenue: MONEY

The revenue received from the health plan.

expense: MONEY

The expenses paid to physicians.

profit: MONEY

revenue - expense

hoursOfOperation: SCHEDULE

<description of the component class and its role in the</p> current class>

physicianCompensation: <TYPE?>

The physician compensation policy. See comment below

practiceGuidelineDevelopment: PROGRAM

The program for developing practice guidelines

practiceGuidelineImplementation: PROGRAM

The program for implementing practice guidelines Operations:

setHours: VOID

Purpose:

Sets the policy for hours of operation

Require:

conditions of the operation>

Algorithm:

deferred

Ensure:

<postconditions for the operation>

setVisitSchedules: VOID

Purpose:

Sets the schedules for outpatient visits, which presumably influence *productivity*

Require:

conditions of the operation>

Algorithm:

deferred

Ensure:

<postconditions for the operation>

setCompensation: VOID

Purpose:

Sets the salaries, bonuses, and retirement benefits for physicians.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

setPracticeGuidelines: VOID

Purpose:

Sets the practice guidelines for various interventions.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

Invariants:

Profit

profit = revenue - expense

Comments:

Physician compensation

How do we want to specify physician compensation (salary, bonus, retirement)? Is it specified as a range based on specialty and experience? How do we choose the values for each physician?

Practice guidelines

What are the specific practice guidelines we need to implement? How do we plan to represent them?

Practice guideline programs

How are these used? Is there just one of each, or are there several active concurrently? (e.g. one for each guidleline under development?)

Class PHYSICIAN

Description:

The general, abstract physician Specializes:

PERSONNEL

The general, abstract personnel.

Aggregates: Operations:

examinePatient(p: PERSON, c: CHART): VOID

Purpose:

examine patient p

Require:

generalized education

An alternative to all these specialized education operations is the specify a general education class and several specializations, antiTobaccoEducation etc. then the

physician would just have a giveEducation operation, with the specific education type as an input. Of course, then the question is where do the instances of education come from. This same approach works for other instructors.

patient chart

All these operations need to be re-examined for updating patient chart.

HOSPITAL CLUSTER

Abstract classes

Class HOSPITAL

Description:

The general abstract hospital

Specializes:

None

Aggregates:

inPatientService: TYPE?

The in-patient service subsystem. See comment below.

outPatientService: SET[DEPARTMENT]

The out-patient service subsystem.

inPatientDays: REAL

The number of in-patient days per thousand members

normalBirthStay: INTEGER

The average length of stay for a normal birth.

phoneHoldingTime: TIME

The average holding time for telephone access.

apptHoldingTime: TIME

The average holding time for a routine appointment.

parkingAvailability: REAL

Some measure of the average availability of parking.

facilities: SET[FACILITY]

The collection of facilities in the hospital.

personnel: SET[PERSONNEL]

The collection of non-physician personnel of the hostpital.

equipment: SET[EQUIPMENT]

The collection of equipment used by the hospital.

supplies: SET[SUPPLY]

The collection of supplies used by the hospital.

drugs: SET[DRUG]

The collection of drugs used by the hospital.

Operations:

setFacilitySchedules: VOID

Purpose:

Set schedules (policy) for facilities.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

For all f such that facilities.contains(f), not f.schedule.void

receivePayment(p:MONEY): VOID

Purpose:

Accept payment from HEALTH_PLAN for resources provided. See comment on accounting below.

Require:

not p.void

Algorithm:

deferred

Ensure:

<postconditions for the operation>

paySuppliers: VOID

Purpose:

Make payment to suppliers. See comment on accounting below.

Require:

conditions of the operation>

Algorithm:

deferred

Ensure:

<postconditions for the operation>

Invariants: Comments:

InPatientService

The structure of the in-patient service subsystem has yet to be specified.

normalBirthStay, apptHoldingTime

apptHoldingTime,

Are these some sort of average (as I've specified above) or are they a predetermined, policy driven value?

Collections versus specific parts.

The various parts of the hospital (facilities, personnel, equipment, etc) have all been specified as abstract SETs, i.e. arbitrary collections. Is this the way we want to model

it, or are these just place holders for some specific facilities, equipment, etc which we have yet to specify?

Accounting mechanism

Once we've designed some sort of accounting mechanism, we need to revisit recievePayment and paySuppliers to include the mechanism in the specification.

FACILITY CLUSTER

Design Issues

Intervention decomposition

In this design, interventions are implemented in layers. Each intervention operation in the facility layer is responsible for making sure all the necessary resources, e.g. patient, personnel, equipment and supplies, are present. It then passes these resources to the corresponding operation in the personnel layer, which uses the corresponding operations in the patient, equipment and supplies layer to perform the intervention. This architecture is reasonably faithful to the problem domain and also minimizes the coupling between the various layers, making the classes more reusable.

Intervention return types

We need a uniform policy for how the results of interventions, especially diagnostic interventions will be communicated. The policy specified here distinguishes between information results, e.g blood pressure, and physical results, e.g. blood sample. Information results are uniformily stored in the patient's chart by the personnel layer intervention. Physical results are features (parts) of the facility which are passed to the personnel layer intervention and set by it. The facility layer intervention leaves the results in the facility, to be transferred by some other procedure. The presumption is that this is approximately how it really works in the problem domain.

Interaction with membership

We have yet to specify any interaction with the membership of the HCO. How do members use the HOSPITAL?

Mutable representations

Immutable representations.

Abstract classes

Class FACILITY

Description:

The general, abstract facility: a building, room or other physical portion of a HOSPITAL.

Specializes:

REUSEABLE RESOURCE

The abstract reuseable resource.

Aggregates:

size: REAL

The size of the facility in square feet.

maintenancePersonnel: SET[PERSONNEL]

The personnel required to maintain the facility.

maintenanceEquipment: SET[EQUIPMENT]

The equipment required to maintain the facility.

maintenanceSupplies: SET[SUPPLIES]

The supplies required to maintain the facility. Operations:

<opr>: <RESULT TYPE>

Purpose:

<description of the purpose of the operation>

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

Invariants:

<invariant>

<description of class invariant>
Comments:

Maintenance requirements and specialization

Once again I've used collections for the maintenance personnel, equipment and supplies. But aren't these just place holders? Doesn't each facility require specific maintenance roles filled by specific specialized types? For instance, an MRI suite must require specific maintenance personnel and supplies. If not, aren't these features common to all reusable resources and therefore can't they be moved to class REUSABLE_RESOURCE?

Class PATIENT_FACILITY

Description:

A facility that can service a single patient **Specializes**:

FACILITY

The general facility

SINGLE_USER_RESOURCE

The general single user resource Aggregates:

patient: PERSON

The patient currently in the room.

chart: PATIENT_CHART

The chart associated with *patient*. Operations:

receivePatient(p: PERSON): VOID

Purpose:

Makes p the current patient.

Require:

p not void

Algorithm:

patient := p;

transaction.setDestination(patient.healthCare); currentUsageStart := current time

Ensure:

See algorithm

releasePatient: PERSON

Purpose:

removes the patient from the facility

Require:

patient not void

Algorithm:

result := patient
patient := void
postUsageCost

Ensure:

Class LOW_LEVEL_PROCEDURE ROOM

Description:

A room for performing low level procedures

Specializes:

FACILITY

The general facility. Aggregates:

patient: PERSON

The current patient in the room.

chart: PATIENT_CHART

The chart associated with patient.

personnel: PERSONNEL

The current personnel in the room

bloodPressureGauge: SPHYGMOMANOMETER

equipment for measuring patient's blood pressure

bloodDrawingKit: BLOOD_DRAWING_KIT

A collection of equipment and/or supplies for drawing blood.

bloodDrawingSupplies: SET[BLOOD_DRAWING_SUPPLIES]

Supplies for drawing blood.

bloodSample: BLOOD_SAMPLE

The blood sample drawn from the patient by the last drawBlood operation.

ekgMachine: EKG_MACHINE

The EKG machine currently in the room. Operations:

processStandardMeasures: <RESULT TYPE>

Purpose:

<description of the purpose of the operation>

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

takeMedicalHistory: VOID

Purpose:

Take the medical history of patient using chart.

Require: .

patient not void
personnel.conforms_to(NON_CRITICAL_CARE_NURS
E)

Algorithm: personnel.takeMedicalHistory(patient: PERSON, chart: PATIENT CHART) Ensure: chart contains medical history measureBloodPressure: VOID Purpose: Measure patient's blood pressure using bloodPressureGauge Require: patient not void bloodPressureGauge not void personnel.conforms to(NON CRITICAL CARE NURS Algorithm: personnel.measureBloodPressure(patient: PERSON, bloodPressureGauge: SPHYGMOMANOMETER, chart: PATIENT CHART) Ensure: chart contains blood pressure drawBlood: VOID Purpose: Take a blood sample from patient Require: patient not void

bloodDrawingKit not void

bloodDrawingSupplies.ct > 0 personnel.conforms to(PHLEBOTOMIST) Algorithm: bloodSample :=personnel.drawBlood(patient. bloodDrawingKit, chart) Ensure: bloodSample not void; chart updated measureLDLCholesterol: VOID Purpose: measure the LDL cholestoreol level of patient Require: patient not void Algorithm: drawBloodsend bloodSample to lab for analysis wait for results record results in chart Ensure: Results recorded in chart measureHDLCholesterol: VOID Purpose: measure the HDL cholestoreol level of patient

Require:

patient not void

Algorithm:

drawBlood

send bloodSample to lab for analysis

wait for results

record results in chart

Ensure:

Results recorded in chart

measureTotalCholesterol: VOID

Purpose:

measure the total cholestoreol level of patient

Require:

patient not void

Algorithm:

drawBlood

send bloodSample to lab for analysis

wait for results

record results in chart

Ensure:

Results recorded in chart

performEKG: VOID

Purpose:

perform an EKG measurement on patient

Require:

patient not void personnel not void

personnel.conformsTo(PHLEBOTOMIST) or

personnel.conformsTo(LOW LEVEL TECHNI

CIAN)

ekgMachine not void

Algorithm:

chart.insert(personnel.performEKG(patient, ekgMachine))

Ensure:

chart.contains(ekg)

measureBloodPressure: <RESULT TYPE>

Purpose:

To be specified

measureProteinLevelInUrine: <RESULT TYPE>

Purpose:

To be specified

measureTemperature: <RESULT TYPE>

Purpose:

To be specified

measureWeight: <RESULT TYPE>

Purpose:

To be specified

takePersonalMedicalHistory: <RESULT TYPE>

Purpose:

To be specified

performHivAntiBodyTest: <RESULT TYPE>

Purpose:

To be specified

treatWithAspirin: <RESULT TYPE>

Purpose:

To be specified

treatWithLovastatin: <RESULT TYPE>

Purpose:

To be specified

treatWithNiacin: <RESULT TYPE>

Purpose:

To be specified

Invariants:

Patient's chart present

patient not void implies chart not void and chart.patient =
patient

Comments:

Differentiating features

Presumably the differenting features of these facilities are the interventions that can be performed there and the associated personnel, equipment, supplies and drugs. What are the specific features for this class?

Connection to laboratory

In measureLDLCholesterol, how does the blood sample get to the lab? And to what lab?

Answer: measureLDLCholesterol in department layer sends it to lab. This may imply that there is no measureLDLCholesterol operation in th facility layer, since all that's done in the facility is to draw blood.

Class MEDICAL WARD

Description:

<description of purpose and defining characteristics of the
class>

Specializes:

FACILITY

The general facility.

Aggregates:

Operations:

Invariants:

Class PHYSICIANS_OFFICE

Description:

The general office for a physican to meet with patients. Doctors talk to patients in these offices, no examinations are done here. Specializes:

FACILITY

The general facility.

Aggregates:

currentPatient: PERSON

The patient currently in the office.

doctor: PHYSICIAN

The physician using the office.

antiTobaccoHandouts: SET[ANTI_TOBACCO_EDUCATION_H ANDOUT!

Handouts for the anti-tobacco education.

dietHandouts:

SET[DIET_EDUCATION_HANDOUT]

Handouts for the diet education.

cleanNeedleHandouts:

SET[CLEAN_NEEDLE_EDUCATION_H ANDOUT]

Handouts for the clean needle education.

sexHandouts: SET[SEX EDUCATION HANDOUT]

Handouts for the sex education.

prenatalHandouts:

SET[PRENATAL_EDUCATION_HANDO UT]

Handouts for the prenatal education.

equipment: SET[EQUIPMENT]

The standard physician's office equipment; see comment. Operations:

talkToPatient

Purpose:

Doctor talks to currentPatient.

Require:

currentPatient not void doctor not void

Algorithm:

deferred

Ensure:

<postconditions for the operation>

giveAntiTobaccoEducation: VOID .

Purpose:

Class WAITING_ROOM

Description:

<description of purpose and defining characteristics of the
class>

Specializes:

FACILITY

The general facility.

Aggregates:

patients: BOUNDED_SET[PERSON]

The patients waiting in the waiting room. Bounded by the capacity of the waiting room.

Operations:

<opr>: <RESULT TYPE>

Purpose:

<description of the purpose of the operation>

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

Invariants:

bounded by capacity

patients.ub = capacity

No queue

queue void Comments:

Shared waiting room

The waiting room may be shared by more than one department and by more than one service within a department. A waiting room is thus more than a single queue; it is several queues sharing the same storage.

DEPARTMENT CLUSTER

Abstract classes

Class DEPARTMENT

Description:

The general, abstract out-patient service facility. The basic organizational unit of the out-patient service.

Specializes:

FACILITY

The general facility

Typical usage

The waiting room is typically not used directly. Instead, references to it are given to various queues to use as storage. Patients are not directly put in the waiting room, they are inserted in queues.

Waitng room queue

WAINTING_ROOM inherits a feature queue from REUSEABLE_RESOURCE. But since a waiting room is the storage for one ore more queues, it doesn't make much sense for it to have a queue itself. Hence the invariant.

Immutable representations

Aggregates:

waitingArea: WAITING_ROOM

A place for patients to wait. May be shared with another department.

Operations:

Invariants:

Comments:

Specialization of FACILITY?

Is *DEPARTMENT* really a specialization of *FACILITY* or are the two synonymous?

Answer: Yes it is, the two are not the same. As indicated by the description, departments are associated with the outpatient service only.

Personnel

Does a department, as opposed to a specific room, have any personnel associated with it? Is a department purely a physical unit (i.e. the rooms) or it is an administrative unit as well. For instance, does it have a staff?

Role in interventions

The "Small Table of Interventions" [iii], lists a department for each intervention, but what role does the department play in delivering interventions?

Shared waiting room

The waiting room may be shared by more than one department and by more than one service within a department. A waiting room is thus more than a single queue; it is several queues sharing the same storage.

Class APPOINTMENT_DEPARTMENT Description:

A department which has a receptionist and accepts appointments.

Specializes:

DEPARTMENT

The general department

Aggregates:

receptionArea: RECEPTION_AREA

A reception area.

receptionist: RECEPTIONIST

The receptionist for the department.

Operations:

makeAppointment(p: PERSON)

Purpose:

Makes an appointment for person p with the the current department.

Require:

Algorithm:

deferred

Ensure:

The appointment is made by the *receptionist* or the *generalAppointmentMaker*

<u>Invariants:</u>

receptionist's queue storage

receptionist.queue.storage = waitingArea

Comments:

General appointment maker.

Who or what is the general appointment maker? (ref: Mariano, notes from discussion with LenS, regarding [ii]) Class MEDICAL DEPARTMENT

Description:

A department with facilities for physicians. <u>Specializes:</u>

APPOINTMENT_DEPARTMENT

The general department that can accept appointments. Aggregates:

physiciansOffices: SET[PHYSICIAN_OFFICE]

The collection of offices for physicians.

examinationRooms: SET[EXAMINATION_ROOM]

The collection of examination rooms in the department. Typically two for each physician's office.

examinationRoomsQueue: QUEUE[PERSON]

The queue of patients waiting for an examination room.

highLevelProcedureRooms:

SET[HIGH_LEVEL_PROCEDURE_ROO
M]

The collection of high level procedure rooms in the department.

highLevelProcedureRoomsQueue: QUEUE[PERSON]

The queue of patients waiting for a high level procedure room.

lowLevelProcedureRooms:
SET[LOW_LEVEL_PROCEDURE_ROO
M]

The collection of low level procedure rooms in the department.

lowLevelProcedureRoomsQueue: QUEUE[PERSON]

The queue of patients waiting for a low level procedure room.

nursesStation: NURSES_STATION

Every medical department has a nurses station.

Operations:

drawBlood: <RESULT TYPE>

Purpose:

To be specified

measureBloodPressure: <RESULT TYPE>

Purpose:

To be specified

takePersonalMedicalHistory: <RESULT TYPE>

Purpose:

To be specified

receivePatient(p: PERSON): VOID

Purpose:

Check patient in for processing.

Require:

p not void

Algorithm:

receptionist.queue.insert(p)

Ensure:

Invariants:

shared queue for examinationRooms

for each room r in examinationRooms, r.queue = examinationRoomsQueue

shared queue for lowLevelProcedureRooms

for each room r in lowLevelProcedureRooms, r.queue = lowLevelProcedureRoomsQueue

shared queue for highLevelProcedureRooms

for some queue qh and for each room r in highLevelProcedureRooms, r.queue = highLevelProcedureRoomsQueue

shared storage for all queues

examinationRoomsQueue.storage =
lowLevelProcedureRoomsQueue.storage =
highLevelProcedureRoomsQueue.storage = waitingArea
Comments:

Operations

What operations can the general medical department do?

Receptionist's queue and receivePatient

receivePatient appears to just insert the patient in a queue. However, the receptionist is concurrently processing patients off the queue. See RECEPTIONIST. But how does the receptionist get initialized?

Multiple queues

MEDICAL_DEPARTMENT inherits a queue from REUSEABLE_RESOURCE via DEPARTMENT and FACILITY. It does use this one and declares several more. Should the general reuseable resource have several queues? Or is the queues associated with the department as a resource some other queue, e.g. the queue of patients waiting for apporintments? The latter seems most likely.

Class CVD DEPARTMENT

Description:

The general, abstract department that can process CVD related appointments

Specializes:

MEDICAL_DEPARTMENT

The general department with facilities for physicians

Aggregates:

Operations:

Invariants:

Comments:

Differentiating features

Comments:

Differentiating features

What are the specific differentiating features of this class? **Immutable representations**

REUSEABLE_RESOURCE

The general reuseable, schedulable resource.

Aggregates:

qualifications: SET[PROCEDURE]

The collection of procedures the personnel is allowed to do.

employmentHistory: TIME

The experience, length of time of service, of the personnel.

absenteeism: REAL

The probability of the personnel being absent.

behaviors: <TYPE?>

The propensity of the physician to use interventions or ro adopt clinical or management policies. See comment below.

recruitCost: MONEY

The cost to recruit the personnel

trainCost: MONEY

The cost to train the personnel

salaryCost: MONEY

The base salary of the personnel

overtimeCost: MONEY

The cost for overtime for the personnel

retirementCost: MONEY

The cost of the retirement plan for the personnel Operations:

skillLevel(i: PROCEDURE, f: FACILITY): REAL

Purpose:

A measure of the physicians skill at performing intervention i at facility f

Require:

qualifications.contains(i)

Algorithm:

deferred

Ensure:

<postconditions for the operation>

<u>Invariants:</u> Comments:

Skill level

The skill level depends on the intervention and location in principle. However, this requires that the physician object know about all interventions and facilities. It may be more desirable, from a maintenance point of view, to have the facility where the intervention is performed know about physicians and interventions, since this is necessary anyway.

Skill level and qualifications

One approach would be to define a type QUALIFICATION, which would contain a procedure code and a skill level. We would then have *qualifications*:

SET[QUALIFICATION] which would represent both the personnels qualification to do a certain procedure and thier skill at it. The skill levlels would be generated when the personnel object was created by sampling some distribution.

Behaviors

It is not yet clear how to model behaviors. The current notion is some combination of rules + distributions, similar to the genetic predisposition mechanism planned for diseases.

Specialists

Each specialization has specific behavior and can perform specific procedures. In principle, we need to program each specialization as a separate class. But is there some acceptable parameterization (classification formally) that would allow us to represent all these as a single class?

Interventions and procedures

I've put almost all the education interventions here, but they probably belong in one or more specializations that have yet to be identified.

Mutable representations Class ADMINSTRATOR

Description:

<description of purpose and defining characteristics of the class>

Specializes:

PERSONNEL

The general non-physician employee.

Aggregates:

Operations:

Invariants:

Comments:

Differentiating features

Presumably this class is specialized by defining operations which correspond to the procedures the personnel type is allowed to perform. What are the specific procedures for this class?

Class CARDIAC_CARE_UNIT_NURSE Description:

EQUIPMENT CLUSTER

Abstract classes

Class EQUIPMENT

Description:

The general, abstract medical equipment.

Specializes:

REUSEABLE RESOURCE

The general reuseable resource.

Aggregates:

identifier: <TYPE?>

A unique identifier for the equipment; e.g. a serial number.

See comment below

isMobile: BOOLEAN

True if equipment can be moved.

age: INTEGER

Numer of uses to date

Subtype or role?

Is this really a special type of personnel, or just a role?

Immutable representations

lifeExpectancy: INTEGER

Expected total number of uses.

reliability: REAL

Probability of failure.

Operations:

<opr>: <RESULT TYPE>

Purpose:

<description of the purpose of the operation>

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

Invariants:

<invariant>

<description of class invariant>

Comments:

Identifers

What type of thing is this? How do we represent it?

Generalizing age, lifeExpectancy and reliability

Can't these three be generalized and moved to REUSEABLE_RESOURCE? Don't all reuseable resources have some version of these three? In fact, can't reliability be moved to RESOURCE?

Other resource requirements

KDA5.2 has a discussion of "other resource requirements" for EQUIPMENT. It would seem that these are place holders for features of specicalized equipment. See KDA5.2

Other specializations

Specializations of EQUIPMENT are listed below. What other specializations do we need to specify?

Class DIAGNOSTIC_EQUIPMENT Description:

The general diagnostic equipment - something that can measure something about a patient

Specializes:

EQUIPMENT

The general equipment

Aggregates:

Operations:

measure(patient: PERSON): RECORD

DRUG CLUSTER

Design issues

Intervention specific operations

As currently specified, each drug know what interventions it participates in becuase it has a specific operation for each intervention. There are several other possible designs: (i) drugs do not know about interventions, they have one or more operations that effect various parts of the patient; (ii) they have only one operation, they give themselves to the patient; (iii) they have know operations, the patient takes them and the implementation of the patient decides what effect they have. Approach (iii) seems the most natural, but further development will decide the issue. For the moment, I've left the intervention specific operations in the specification, if only to serve as a cross reference.

Abstract classes

Class DRUG

Description:

The general, abstract drug. A supply with special controls and reporting features.

Specializes:

SUPPLY ·

The general supply

What are the specific differentiating features of this class? Immutable representations

Aggregates:

Operations:

Invariants:

Comments:

Differentiating features.

What are the control and reporting features that differentiate DRUG from SUPPLY? What are the features that differentiate the various specific drugs?

Mechanism of drug action

Presumably, drug objects do things to person objects. We need to define this mechanism. The various specialized drugs will presumably be different representations for this mechanism.

Mutable representations

Class AIDS DRUG

Description:

<description of purpose and defining characteristics of the
class>

Class CALENDAR

Description:

The general calendar

Specializes:

None

Aggregates:

Operations:

Invariants:

Comments:

Can we buy this?

One would think that a calendar would be the type of commonly used component one could buy. I don't think we are too particular about its features.

Class SCHEDULE

Description:

A schedule of operating hours for a resource Specializes:

CALENDAR

The general calendar.

Aggregates:

lengthOfDay(d: DATE): TIME

The number of hours the resource is available on date d. Operations:

lengthOfDay(d: DATE): TIME

Purpose:

The length of the operational day.

Require:

conditions of the operation>

Algorithm:

deferred

Ensure:

result > 0

·open(d: DATE): TIME

Purpose:

The time the resource becomes available for use on date

d.

Require:

conditions of the operation>

Algorithm:

deferred

Ensure:

<postconditions for the operation>

setOpen(day:DATE, o: TIME): VOID

Purpose:

Sets the open time for date day.

Require:

Algorithm:

deferred

Ensure:

open(d) = o and open(d) < close(d)

close(d: DATE): TIME

Purpose:

The time the resource becomes unavailable for use on

date d.

Require:

conditions of the operation>

Algorithm: deferred

Ensure:

<postconditions for the operation>

setClose(day:DATE, c: TIME): VOID

Purpose:

Sets the open time for date day.

Require:

Algorithm:

deferred

Ensure:

close(d) = c and open(d) < close(d)

Invariants:

lengthOfDay positive

for all d open(d) <= close(d)

Comments:

Enhancements

This specification is probably too simple for what we need. For instance, it allows only a single period of operation. What features do we need to add for completeness and convenience?

Class TIME

Description:

Some type for representing time (e.g. day time, simulation time)

Specializes:

Aggregates:

Operations:

Invariants:

Comments:

Differentiating features

What specific differentiating features does this class have?

Class DATE

Description:

Some type for representing dates.

Specializes:

Aggregates:

Operations:

<u>Invariants:</u> Comments:

Differentiating features

What specific differentiating features does this class have?

Class QUEUE[T]

Description:

A queue of objects of type T

Specializes:

Aggregates:

storage: BOUNDED_SET

The storage in which items in the queue are placed; possibly shared with other queues.

isEmpty: BOOLEAN

True if no items in queue

isFull: BOOLEAN

True if there is no more room in storage; i.e. if storage.isFull

Operations:

insert(item: T)

Purpose:

Inserts item into the queue.

Require:

item not void and not isFull

Algorithm:

deferred

Ensure:

not isEmpty and back = item

remove: T

Purpose:

Removes the item at the front of the queue

Require:

not isEmpty

Algorithm:

deferred

Ensure:

result not void and result = old front and not isFull

back: T

Purpose:

Returns the item at the back of the queue, but does not remove it from the queue

Require:

not isEmpty

Algorithm:

deferred

Ensure:

result not void

front: T

Purpose:

Returns the item at the front of the queue, but does not remove it from the queue

Require:

not isEmpty

Algorithm: deferred

Ensure:

result not void

Invariants:

Comments:

Shared storage

Multiple queues may share the same storage. For instance, a waiting room may be the storage for several queues for different departments or services. How do we implement this?

Answer: *storage* is a reference (pointer) to a bounded set. Several queues may be given a reference to the same storage.

Class SET[T]

Description:

The general abstract collection of objects of type T

Specializes:

Aggregates:

ct: INTEGER

Count; the number of items in the set

isEmpty: BOOLEAN

True if ct = 0 Operations:

insert(item:T)

Purpose:

Insert the item in the set.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

remove(item: T)

Purpose:

Remove the item from the set.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

contains(item:T): BOOLEAN

Purpose:

True if item is a member of the set.

Require:

conditions of the operation>

Algorithm:

<pseudocode for operation>

Ensure:

<postconditions for the operation>

Invariants:

Comments:

Loose usage

The notion of set is used somewhat loosely in this specification for any arbitrary collection. In particular, I've not worried much about whether a given item can appear in a "set" more than once. Depending on context multiset or bag might be more rigorously correct, but I've not sorted that out.

Class BOUNDED_SET[T]

Description:

A set of items of type T with a fixed, finite maximum number of elements

Specializes:

SET[T]

The general set.

Aggregates:

ub: INTEGER

The upper bound on the number of items in the set; the capacity of the set.

RECORDS CLUSTER

Abstract Classes

Class RECORD

Description:

A physical entity used to store information.

Specializes:

Aggregates:

Operations:

Invariants:

Comments:

Differentiating features

What are the specific differentiating features of this class?

isFull: BOOLEAN

True if ct = ub

Operations: Invariants:

Bounded

Comments:

Mutable representations Immutable representations

Class EKG RECORD

Description:

The results of an EKG measurement **Specializes**:

RECORD

The general record.

Aggregates:

patient: PERSON

The patient the chart belongs to.

Operations:

Invariants:

Comments:

Differentiating features

What are the specific differentiating features of this class?

Class BLOOD_PRESSURE_RECORD

Description:

The result of a blood pressure measurement

Specializes:

RECORD

The general record

Aggregates:

systolicPressure: REAL

The systolic blood pressure reading

diastolicPressure: REAL

The diastolic blood pressure reading

Operations:

Invariants:

Comments:

Differentiating features

What are the specific differentiating features of this class?

Class PATIENT CHART

Description:

The collection of medical records maintained for a patient. Specializes:

SET[RECORD]

The collection of records

Aggregates:

Operations:

Invariants:

Comments:

Patient reference

Patient is a direct reference to the associated patient object. It may be more correct to have one or more patient identifiers.

Other features

We probably need additional features here, a patient chart must be more than just a set of records. We can add them as they become apparent.

Mutable Representations Immutable Representations

ACCOUNTS CLUSTER

Design Issues

Accounting model.

We've adopted a simplified model of accounting in this specification, based on the detailed analogy between accounting systems and plumbing systems (really!) develop by Purcell [iv]. Accounts store value, like tanks store water in a plumbing system. Transactions are flows of value from source accounts to destination accounts. By convention, positive flows move positive value from source to destination. A transaction thus decrements (subtracts signed value) from its source accounts and increments (adds signed value) to its destination accounts. Conservation of value requires that the sum of the source amounts in a transaction equals the sum of destination amounts.

No distinction is made between asset and liability accounts, or between income and expense accounts. Accounts can have either a positive or a negative balance and the liability and expense accounts just have negative balances under normal conditions. There is however a distinction between asset/liability accounts and income/expense accounts - the income/expense account balances are reset to zero at the beginning of each accounting period, while the asset/liability account balances are carried forward. The asset/liability accounts are thus cumulative accounts that represent the value stored in the organization which the accounting system models, while the income/expense accounts are rate accounts that represent value flows into or out of the organization, averaged over the accounting period. Net worth is the simple sum over all cumulative accounts, rather than the difference of the sum of the asset accounts and the sum of the liability accounts. Similarly, net income is the simple sum of the rate accounts,

rather than the difference of the sum of the income accounts and the sum of the expense accounts.

Abstract Classes

Class BALANCE

Description:

The general, abstract financial account; something with a balance, measured in MONEY.

Specializes:

None.

Aggregates:

isRate: BOOL

True if balance is zeroed at beginning of each accounting period.

Operations:

balance: MONEY

Purpose:

Returns the balance of the account

Require:

None

Algorithm:

deferred

Ensure:

Result = balance of account

zero: VOID

Purpose:

Sets the balance to zero.

Require:

None

Algorithm:

deferred

Ensure:

balance = 0.

Invariants:

Comments:

Name

The name for this class is not entirely satisfactory.

Class ACCOUNTABLE

Description:

The general, abstract, accountable object

Specializes:

None

Aggregates:

rateAggregate: SUMMARY ACCOUNT

The value associated with the current object and its parts, recursively, during the current accounting period.

cumulativeAggregateCost: SUMMARY ACCOUNT

The accumulated value associated with the current object and its parts, recursively.

rateIntrinsic: ACCOUNT

The value intrinsic to the current object, not including value associated with its parts, during the current accounting period.

cumulativeIntrinsicCost: ACCOUNT

The accumulated value intrinsic to the current object, not incuding value associated with its parts.

Operations:

Invariants:

Comments:

Top down versus bottom-up accounting

There are (at least) two ways to deal with accounting. The first (top-down) is that wholes calculate and accumulate their costs from the costs of their parts, recursively. The other is that whole gives their parts accounts to accrue expenses to, recursively, and the parts enter a transaction in the account each time a resource consuming action is taken. The latter mechanism is more like the problem domain, but requires modelling and coding the entire accounting system of the problem domain. In the former, each part is is own account.

Class RESOURCE

Description:

The general, abstract, multi-user resource. Intended to provide an abstract interface to the capacity and accounting aspects of a variety of resources, e.g. facilities, personnel, equipment, etc. Specializes:

ACCOUNTABLE

The general, abstract object with stored value

EXHAUSTABLE

The general object with finite capacity. Aggregates:

quality: REAL

Some quantitative measure of the quality of the resource.

capacityCost: MONEY

The usage dependent cost of the resource, per unit of capacity. For instance, the cost per dose of Tylenol or the direct wage rate for personnel.

timeCost: MONEY

The usage independent cost of the resource, per unit time. For instance, the cost per month of leased equipment or the cost per year of retirement benefits for personnel.

acquisitionCost: MONEY

Any one time expenses associated with acquiring the resource. For instance, the construction cost of a facility or recruitment cost for personnel. Presumably capitalized and depreciated.

liquidationCost: MONEY

Any one time expenses (or income) associated with liquidating the resource.

usageTransaction: TRANSACTION1N

The transaction the represents the flow of intrinsic value from the resource to its clients each time the resource is used.

currentUsers: SET[ACCOUNTABLE]

The current users of the resource, if any.

currentUsageStart: TIME

The absolute time the current usage started

currentUsageAmount: CAPACITY

The number of units of capacity the current usage involved

Operations:

startUsage: VOID

Purpose:

Log the beginning of a usage session

Require:

currentUsers.ct > 0

Algorithm:

currentUsageStart := current time ...

Ensure:

See algorithm

usageCost: MONEY

Purpose:

Evaluates the cost for the current usage

Require:

transaction not void

Algorithm:

result := capacityCost*currentUsageAmount + timeCost*(current time - currentUsageStart)

Ensure:

See algorithm

distributeCost(cost: MONEY): VOID

Purpose:

Distribute the cost to the destination entries in the transaction

Require:

None

Algorithm:

deferred

Ensure:

each destination entry in transaction gets the appropriate

amount of value

not transaction.hasBeenPosted

stopUsage: VOID

Purpose:

Evaluate the cost of the current usage, enter it in *transaction* and post it

Require:

transaction not void

Algorithm:

distributeCost(usageCost)

transaction.post

Ensure:

usageCost is properly distributed to user accounts

Invariants:

validCapacity

capacity not void

transaction

transaction not void and not transaction.hasBeenPosted
implies transaction.start = currentUsageStart
Comments:

usageCost

The specified algorithm does not distribute the acquisition asnd liquidation costs over the usage in any way. Is this the right way to do it?

Quality

I've specified the quality feature in the abstract, but is this really possible? Is it possible to talk about the quality of a resource without regard to what it is being used for?

Invariants and preconditions

Need to review invariants and preconditions wrt start ands stop time and transaction has been posted.

Class SINGLE_USER_RESOURCE Description:

A resource with at most one user at a time **Specializes**:

RESOURCE

The gneral multi-user resource redefine *transaction*

Aggregates:

transaction: TRANSACTION11

A single source, single destination transaction

Operations:

Invariants:

Comments:

Differentiating features

What are the specific differentiating features of this class?

Class REUSEABLE RESOURCE

Description:

The general, abstract reuseable resource: a resource with a schedule.

Specializes:

RESOURCE

The general resource.

Aggregates:

schedule: SCHEDULE

The schedule of the resource.

queue: QUEUE[TYPE?]

The queue of clients waiting to use the resource. See comment below.

maintenanceCost: MONEY

The cost per unit time of maintaining the resource. Operations:

setSchedule(s: SCHEDULE): VOID

Purpose:

Sets the schedule of the resource.

Require:

not s.void

Algorithm:

deferred

Ensure:

schedule = s

Invariants:

valid schedule

not schedule.void

Comments:

Queue

In principle, every reuseable resource needs a queue of clients waiting to use the resource. The queue may be an object explicitly defined in the problem domain, for instance a waiting room, or it may be an object defined only in the software implementation. As I've specified this design, every explicit problem domain object that serves as a queue will need to inherit from class QUEUE.

Type of client

What do we put in for the type of client waiting in the queue?

maintenanceCost

Should maintenanceCost be per unit time or per unit capacity?

Class EXHAUSTABLE

Description:

The general, abstract, object with finite capacity.

Specializes:

None

Aggregates:

capacity: CAPACITY

The capacity of the object.

Operations:

Invariants:

validCapacity

capacity not void

Comments:

Class CAPACITY

Description:

The general abstract quantitative measure of capability. Specializes:

None

Aggregates:

value: REAL

The numerical measure of capacity.

units: STRING

The units the capacity is measured in. See comment below. Operations:

Invariants:

Comments:

Features

It's not yet clear what features we want this class to have. The class is defined to support the notion of capacity associated with the general resource. Just how we will need to sue this is not clear. The indicated features are just a guess.

Units

I've specified units to be of type STRING. An enumerated type might be more appropriate.

Mutable Representations Class ACCOUNTING_SYSTEM

Description:

A collection of accounts that models some organization.

Specializes: Aggregates:

cumulativeAccounts: TREE[BALANCE]

The collection of cumulative accounts. Interior nodes are SUMMARY ACCOUNTs and leaves are ACCOUNTs

rateAccounts: TREE[BALANCE]

The collection of rate accounts. Interior nodes are SUMMARY_ACCOUNTs and leaves are ACCOUNTs

beginingOfPeriod: DATE

The beginning of the current accounting period

endOfPeriod: DATE

The beginning of the current accounting period Operations:

startAccountingPeriod: VOID

Purpose:

Starts the accounting period. Zeros or carries forward balances on accounts as appropriate.

Require:

None

Algorithm:

rateAccounts.root.reset

Ensure:

for each account in rateAccounts account.isRate implies account.balance = 0

Invariants:

interior nodes are summary accounts

for each balance in chartOfAccounts,
balance.childCt /= 0 implies
balance.conformsTo(SUMMARY_ACCOUNT) and
balance.childCt = 0 implies balance
conformsTo(ACCOUNT)

Comments:

Other operations yet to be specified

There's obviously a number of other operations. For instance, insert account into chart, set accounting period, etc.

Class SUMMARY_ACCOUNT Description:

An account which aggregates other accounts. The balance of a summary account is the sum of its subaccount's balances and no direct increments or decrements are allowed.

Specializes:

BALANCE

The general, abstract account.

Aggregates:

subaccounts: SET[ACCOUNT]

The accounts which are summarized by Current. Operations:

balance: MONEY

Purpose:

Returns the balance of the account; i.e. the sum of the balances of the subaccounts

Require:

None

Algorithm:

result = 0;

for each account in subaccounts, result += account.balance

Ensure:

Result = sum of subaccount balances

zero: VOID

Purpose:

Sets the balances of all subaccounts to zero.

Require:

None

Algorithm:

for each account in subaccounts, account.zero

Ensure:

All subaccounts have zero balane

insertSubAccount(a: ACCOUNT): VOID

Purpose:

Inserts a into subaccounts

Require:

a.isCumulative = isCumulative

Algorithm:

subaccounts.put(a)

Ensure:

subaccounts.contains(a)

deleteSubAccount(a: ACCOUNT): VOID

Purpose:

Deletes a from subaccounts

Require:

subaccounts.contains(a)

Algorithm:

subaccounts.delete(a)

Ensure:

not subaccounts.contains(a)

Invariants:

uniform type

for each account in subaccounts, isCumulative = account.isCumulative

Comments:

Class ACCOUNT

Description:

The common, mutable account.

Specializes:

BALANCE

The general account.

Aggregates:

Operations:

increment(amount: MONEY): VOID

Purpose:

Adds amount to balance.

Require:

amount >= 0

Algorithm:

balance += amount

Ensure:

• new balance = old balance + amount

decrement(amount: MONEY): VOID

Purpose:

Subtracts amount from balance.

Require:

amount >= 0

Algorithm:

balance -= amount

Ensure:

new balance = old balance - amount

Invariants:

Comments:

Class TRANSACTION

Description:

An accounting transaction.

Specializes:

Aggregates:

hasBeenPosted: BOOL

True if tansaction has been posted to the source and destination accounts.

sourceEntries: SET[ACCOUNT_ENTRY]

The source account entries for the transaction; the accounts and amounts which value flows out of.

destinationEntries: SET[ACCOUNT ENTRY]

The destination account entries for the transaction; the accounts and amounts which value flows in to.

start: TIME

The absolute time the transaction began

end: TIME

The absolute time the transaction ended

doSave: BOOL

if true, write transaction to file after posting it. Operations:

post: VOID

Purpose:

Distributes the transaction into the source and destination accounts

Require:

not hasBeenPosted

Algorithm:

for each entry in sourceEntries, entry.account.decrement(entry.amount) for each entry in destinationEntries, entry.account.increment(entry.amount) if doSave then write transaction to file

Ensure:

hasBeenPosted

Invariants:

conservation of value

sum of source entry amounts = sum of destination entry amounts

Comments:

Saving to a file

We need to specify the persitence mechanism in more detail. In particular, just what file do we save it to?

Class ACCOUNT_ENTRY

Description:

An entry in an account; a source or destination in a transaction. Specializes:

Aggregates:

account: ACCOUNT

The account for the entry

amount: MONEY

The amount of the entry.

Operations:

setAccount(a: ACCOUNT): VOID

Purpose:

set account = a

Require:

· a not void

Algorithm:

account := a

Ensure:

account = a

setAmount(a: MONEY): VOID

Purpose:

set amount = a

Require:

a not void

Algorithm:

amount := a

Ensure:

amount = a

Invariants:

account exists

account not void

Comments:

Class TRANSACTION11

Description:

A transaction with 1 source account and 1 destination account Specializes:

TRANSACTION

The general transaction

Aggregates:

Operations:

make(src, dst: account, amount: money): VOID

Purpose:

Constructor.

Require: destination: ACCOUNT src not void, dst not void, money not void Purpose: Algorithm: returns destination account sourceEntries.insert(srcEntry.make(src, amount)) destinationEntries.insert(dstEntry.make(dst, amount)) Require: None Ensure: None Algorithm: result := destinationEntries.item(1).account source: ACCOUNT Ensure: result = destination account Purpose: returns source account setDestination(a: ACCOUNT): VOID Require: None Purpose: Sets the destination account to a Algorithm: result := sourceEntries.item(1).account Require: a not void Ensure: resulkt = source account Algorithm: destinationEntries.item(1).setAccount(a); setSource(a: ACCOUNT): VOID Ensure: desintation account is a Purpose: Sets the source account to a amount: MONEY Require: a not void Purpose: The amount of the transaction Algorithm: sourceEntries.item(1).setAccount(a); Require: None Ensure:

desintation account is a

Algorithm:

result := sourceEntries.item(1).amount

Ensure:

result := sourceEntries.item(1).amount

setAmount(a: MONEY): VOID

Purpose:

Sets the amount of the transaction, but leaves the source and destination unchanged

Require:

a not void

Algorithm:

sourceEntries.item(1).setAmount(a)
destinationEntries.item(1).setAmount(a)

Ensure:

source and desitnation unchanged; both amounts = a

setAmountAndPost (a: MONEY): VOID

Purpose:

Sets the amount of the transaction then posts the transaction

Require:

a not void

Algorithm:

setAmount(a)

post

Ensure:

source unchanged; both amounts = a

Invariants:

one source, one destination

sourceEntries.ct = 1 and destinationEntries.ct = 1

Comments:

Class TRANSACTIONIN

Description:

A transaction with 1 source account and a variable number (n) of destination accounts

Specializes:

TRANSACTION

The general transaction

Rename amount to sourceAmount

Aggregates:

Operations:

make(src: ACCOUNT, amount: money): VOID

Purpose:

Constructor.

Require:

src not void, dst not void, money not void

Algorithm:

sourceEntries.insert(srcEntry.make(src, amount))

Ensure:

None

source: ACCOUNT

Purpose:

returns source account

Require:

None

Algorithm:

result := sourceEntries.item(1).account

Ensure:

resulkt = source account

setSource(a: ACCOUNT): VOID

Purpose:

Sets the source account to a

Require:

a not void

Algorithm:

sourceEntries.item(1).setAccount(a);

Ensure:

desintation account is a

sourceAmount: MONEY

Purpose:

The amount of the transaction

Require:

None

Algorithm:

result := sourceEntries.item(1).amount

Ensure:

result := sourceEntries.item(1).amount

setSourceAmount(a: MONEY): VOID

Purpose:

Sets the amount of the transaction, but leaves the source and destination unchanged

Require:

a not void

Algorithm:

sourceEntries.item(1).setAmount(a)

Ensure:

source and desitnation unchanged; both amounts = a

Invariants:

one source

sourceEntries.ct = 1

Comments:

Immutable Representations
