Please note the attached.

Dr. John W. Wrench, Jr. has checked nearly 2000 entries in Tables I and II, and provided most of the corrections and extensions<sup>†</sup> in the following list. Nearly all of the remaining entries in these two tables have been checked by recalculation.

The authors will appreciate being informed of any other errors discovered in the report.

ABSTRACT

This collection of mathematical data consists of two tables of decimal constants arranged according to size rather than function, a third table of integers from 1 to 1000, giving some of their properties, and a fourth table listing some infinite series arranged according to increasing size of the coefficients of the terms. The decimal values of Tables I and II are given to 20 D.

### MATHEMATICAL CONSTANTS

This unconventional table of mathematical constants is an accumulation of numbers collected in a card file over a period of years. The arrangement is not by function or class but in order of size. Tables I and II list decimal numbers and Table III the integers from 1 to 1000. Table IV is not really a list of constants, but mathematical functions expressible in power series, and arranged numerically according to the coefficients of the terms of the series expansion.

A brief description of the tables follows.

#### Table I

The numbers in this table are arranged in the order of the decimal part only. The values listed have not been selected according to any criterion, other than being true mathematical constants. Many are well known, others are obscure, and some have little reason to exist. The sources in many cases have been lost, but most of the numbers can be found in references 1-7.

The table can be used in at least two ways: 1) For improvement of the accuracy of a constant on hand, and 2) for possible identification of a number obtained by empirical or other means. It is, of course, necessary that the number be in the table, and for this reason a table a thousand times as large would be much more useful. For the most part the entries are given to 20D (decimals), and about half of them have been recomputed. Nearly all have been checked to 10 or 12D. If a number to be identified is not found in the tables, derived values can be sought, such as the reciprocal, the complement, logarithm, exponential, square, square root, etc.

Unfortunately it is inevitable that errors are present, especially in the last digit or two. It is hoped that the number of serious errors is

small, but the experience with errors in the original file indicates there will be some present.

The first entry in Table I was contributed by Prof. J. R. Woodyard. The last entry is one of a class of numbers studied by Ramanujan (6) and others.

#### Table II

After Table I was typed, it was thought worthwhile to include the roots of some common quadratic equations, and rather than retype the whole table, Table II was made listing these roots, together with a few other constants. The presence of an asterisk between two entries in Table I indicates that one or more numbers for this position will be found in Table II.

#### Table III

This table lists the integers from 1 to 1000, together with some of their properties. As in Table I, much of the data merely accumulated. It is intended, however, that the representation in terms of sums of two and three squares, sums of two and three cubes, and differences of squares and of cubes, be complete. Following the listing of a number, the corresponding binary form is given, and immediately below this is the ternary representation. The binary number consists of groups of three digits to facilitate conversion to the octal form.

A list of definitions of terms used precedes the table.

#### Table IV

In keeping with the inverted philosophy of this report, a short compilation of mathematical functions described by infinite power series is

presented. The arrangement is such that the coefficients of the terms of the power series must be known, and the corresponding function in closed form can then be found, if listed. The series is "normalized" in some sense, so that the first term is 1, and the entries are arranged in order of increasing magnitude of the coefficient for x. Where two or more series have the same first coefficient, the placement is determined by the coefficient of  $x^2$ , etc. A decimal value of the coefficient as well as the exact value is given to facilitate look-up.

As an example, a listing for  $\frac{1}{x} \ln(1 + x)$  is

1	1
-1/2	-0.50000 00000
1/3	0.33333 33333
-1/4	-0.25000 00000
.	.
.	.
.	.

The power series is then

$$1 - \frac{1}{2} x + \frac{1}{3} x^2 - \frac{1}{4} x^3 + \dots$$

The usual expression for  $\ln(1 + x)$  has been divided by x to make the first term 1.

ACKNOWLEDGEMENT

The authors express their appreciation and amazement to Linda Ambrose and Kathy McCracken for typing the more than 100,000 digits with remarkably few errors.

DEFINITIONS

Table III

$a_n$  See Ref. 33

automorphic See Ref. 45

$E_n$  Euler number. See Ref. 1, p. 804

$\binom{n}{m}$  binomial coefficient =  $\frac{n!}{m!(n-m)!}$

perfect number. See Ref. 46

$p(n)$  unrestricted partitions of the number  $n$ ; i.e., the number of ways in which 1, 2, 3, ...  $n$  may be added to give  $n$ . Thus,

$$4 = 1 + 1 + 1 + 1 = 1 + 1 + 2 = 1 + 3 = 2 + 2, \text{ so that } p(4) = 5.$$

See Ref. 1, p. 825.

$q(n)$  partitions of  $n$  in which the summands are not repeated. E.g.,

$$6 = 1 + 5 = 2 + 4 = 1 + 2 + 3, \text{ so that } q(6) = 4. \text{ See Ref. 1, p. 825.}$$

$r(n)$  unrestricted partitions of  $n$ , except that 1 is omitted.

$r(n) = p(n) - p(n-1)$ . E.g.,  $6 = 4 + 2 = 3 + 3 = 2 + 2 + 2$ , so that  $r(6) = 4$ . The generating function is

$$\sum_{n=0}^{\infty} r(n)x^n = \prod_{n=2}^{\infty} (1 - x^n)^{-1}$$

$S_n^{(m)}$  Stirling number of the first kind.  $(-1)^{n-m} S_n^{(m)}$  is the number of permutation of  $n$  symbols having exactly  $m$  cycles. E.g., the permutations acb, bac, and cba of abc each have two cycles, so that  $S_3^{(2)} = -3$ .

See Ref. 1, p. 824

$S_n^{(m)}$  Stirling number of the second kind. This is the number of ways of partitioning  $n$  elements into  $m$  non-empty subsets. E.g.,

abcd:	a	b	cd
	a	c	bd
	a	d	bc
	b	c	ad
	b	d	ac
	c	d	ab

$\therefore S_4^{(3)} = 6$  See Ref. 1, p. 824.

 $+ \sqrt{5 + 2\sqrt{5}}/2$

This is the minimum total length of lines tying together the five points of a regular pentagon having unit sides.

40.  $0.05233 \dots = \sin 3^\circ = (1/16)(2\sqrt{5 + \sqrt{5}} - 2\sqrt{15 + 3\sqrt{5}} - \sqrt{2} - \sqrt{6} + \sqrt{10} + \sqrt{30})$

$0.99862 \dots = \cos 3^\circ = (1/16)(2\sqrt{5 + \sqrt{5}} + 2\sqrt{15 + 3\sqrt{5}} + \sqrt{2} - \sqrt{6} - \sqrt{10} + \sqrt{30})$

$$41. \quad 1.83928 \dots = (1/3)(1 + (19 + \sqrt{297})^{1/3} + (19 - \sqrt{297})^{1/3})$$

$$= \text{root of } x^3 - x^2 - x - 1 = 0$$

This root is the limit of the ratio of adjacent terms formed in the same manner as Fibonacci numbers (Ref. 31), but adding three terms instead of two.

$$42. \quad \sin 10^4 = -\sin 17^\circ.79513 \ 08232 \ 08767 \ 98155$$

$$\cos 10^4 = -\cos 17^\circ.79513 \ 08232 \ 08767 \ 98155$$

$$43. \quad 137.03859 \dots = e^u$$

$$4.92026 \dots = u = \text{root of } x^3 + 5x^2 + 2x - 250 = 0$$

$$44. \quad f(x) = \left[ 1 - 2^x \left( \frac{x \ln 2}{2^x - 1} \right)^2 \right]^{-\frac{1}{2}}$$

45. An automorphic number is one the square of which ends in the given number.

46. A perfect number is a number such that the sum of all the factors, including 1, is equal to the number.
