In reply refer to: PGPL-5

Dear Interested Parties:

Please note that the naming convention of this "*Pacific Northwest Loads and Resources Study*," commonly called the "White Book has been revised to reflect the publishing year of the document and includes all data updates through March 31, 2006. Since the timing of this White Book publication is 2006, this year's White Book is now titled the "*2006 Pacific Northwest Loads and Resources Study*," or the 2006 White Book, rather than 2005. This change creates less confusion as to the vintage of the data. BPA did not skip a year of this document publication, rather just revised the naming convention.

This document is Bonneville Power Administration's (BPA) "*2006 Pacific Northwest Loads and Resources Study*," commonly called the "White Book." The 2006 White Book is a snapshot as of March 31, 2006, of the Pacific Northwest (PNW) region and the Federal system loads and resources for Operating Year (OY) 2007 through 2016. This analysis incorporates BPA's estimates of PNW total retail loads, contract obligations, contract purchases, and resource capabilities. BPA compiles these estimates with those provided by PNW Federal agencies, public agencies, cooperatives, U.S. Bureau of Reclamation (Bureau), U.S. Army Corps of Engineers (USACE), and investor-owned utilities (IOUs) through annual data submittals. These combined projections provide projections of the PNW region and Federal system load and resource capabilities for the 10-year study horizon, operating years (OY) 2007 through 2016.

The White Book projections are used as input into BPA's long-range resource planning process to assist planning for adequate and reliable load service for the Federal system and the PNW region. This White Book includes scenarios under various resource levels for both the Federal system and the PNW region. The 2006 Pacific Northwest Loads and Resources Study is an update to the previous 2004 White Book.

Federal Firm Sales and Load Obligations

Federal system sales and load obligations are comprised of BPA's power sales contract (PSC) obligations to PNW Federal agency, public agency, cooperative, USBR, IOU, and DSI customers and other BPA firm contractual obligations.

BPA Power Sales Contract Obligations: BPA executed 5- or 10-year PSCs with Federal agency, public agency, public utility cooperative, USBR, IOU, and DSI customers that began October 1, 2001. The following sets forth BPA's PSC firm power load obligations projected for the 2006 White Book study period:

- BPA's Federal agency, public agency, cooperative, and USBR customers signed either 5- or 10-year PSCs. Some of the public agencies, and cooperatives signed up for the 10-year Slice Product. BPA's PSC and Slice obligations end September 30, 2011; however, this study assumes that BPA will meet these or similar obligations in agreements through OY 2016. BPA's total PSC load obligations are estimated to range from 7,176 aMW in OY 2007 to 7,631 aMW in OY 2016. In actual operation, BPA's obligations to serve these customers may be higher or lower than those shown in this analysis;
- The IOU's signed the 10-year Residential Purchase and Sales Agreement (RPSA) settling BPA's obligations under Section 5(c) of the Northwest Power Act to the IOUs. 16 U.S.C. §839c(c)(1). As a result of negotiations in 2001, IOU RPSA settlement firm power deliveries were reduced in exchange for financial considerations resulting in a net IOU RPSA settlement power delivery of 258 aMW, per month, through September 30, 2006, or a 43 aMW annual average for the partial year. For the period October 1, 2006, through September 30, 2011, this study assumes that BPA's IOU RPSA settlement contracts provide only financial benefits and no firm power is delivered. This assumption is consistent with the amendments made to the RPSA contracts by BPA and the IOUs on May 28, 2004; and
- BPA's DSI customers signed 5-year contracts effective from October 1, 2001, through September 30, 2006. BPA's DSI load obligations reflect signed load reduction agreements, contract terminations, and closures through March 31, 2006. BPA's DSI load obligations are estimated to be up to 265 aMW, per month, through September 30, 2006, resulting in a 44 aMW annual average for the partial year OY 2007. For October 1, 2006, through September 30, 2011, this study incorporates the policies adopted in BPA's Supplemental DSI ROD, dated May 31, 2006.

Table 1, shows BPA's Federal agency, public agency, cooperative, USBR, IOU, and DSI projected PSC load obligations.

Table 1
2006 White Book
BPA Power Sales Contract Load Obligations
Annual Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
USBR	160	160	160	160	160	160	160	160	160	160
Federal Agency	123	129	139	141	142	142	143	144	145	147
Public Agency ^{1/}	6,893	6,982	7,026	7,088	7,125	7,079	7,084	7,181	7,229	7,324
DSI ^{2/}	44	0	0	0	0	0	0	0	0	0
IOU Power Deliveries ^{3/} Less Power Purchase Program ^{4/}	64	0	0	0	0	0	0	0	0	0
<i>Net IOU Power Deliveries ^{5/}</i>	<i>43</i>	<i>0</i>								

- ^{1/} BPA's PSC net requirement load obligations that include full service, partial service, block, slice block, and slice resource contracts. BPA's PSC obligations are reduced for load reduction agreements and conservation augmentation.
- ^{2/} BPA's DSI customers signed 5-year contracts beginning October 1, 2001, extending through September 30, 2006, and reflect load reduction agreements and contract terminations as of March 31, 2006. For October 1, 2006, through September 30, 2011, this study incorporates the policies adopted in BPA's Supplemental DSI ROD, dated May 31, 2006.
- ^{3/} BPA's IOU RPSA settlement power deliveries were reduced through September 30, 2006. For October 1, 2006, through September 30, 2011, BPA's IOU RPSA settlement contracts assume only financial benefits and no power is delivered.
- ^{4/} In addition to the IOU RPSA settlement, some of the IOUs reduced BPA's obligations utilizing power purchase programs through September 30, 2006. Under these programs, BPA purchased power back from some of the IOUs through September 30, 2006. These contracts are shown as BPA purchases in Intra-Regional Transfers and reduce BPA's actual IOU power deliveries.
- ^{5/} BPA's net IOU PSC power deliveries, under the RPSA settlement reduced for BPA power purchase programs.

Federal System Resources

BPA is the designated marketer of the hydro resources of the Federal system, which includes 31 dams owned and operated by the Bureau and USACE. BPA also markets the generation from: hydro projects owned by the City of Idaho Falls through September 30, 2006, and Lewis County Public Utility District; thermal generation from the Columbia Generating Station nuclear plant, operated by Energy Northwest, Inc.; and the output from several renewable power plants under power purchase contracts with BPA, primarily cogeneration and wind turbines. The hydro regulation study incorporates power and non-power requirements that BPA expects to be in effect during the study period, including those measures described by: 1) the National Oceanographic and Atmospheric Administration Fisheries (NOAA Fisheries) Biological Opinion, dated November 2004, as modified by Court-Ordered operations for 2006; 2) the U.S. Fish and Wildlife Service (USFWS) Biological Opinion, published December 2000; 3) operations described in the Northwest Power and Conservation Council's (Council) Fish and Wildlife Program; and 4) other fish

mitigation measures. Estimates of hydro resources include projected hydro improvements expected to increase and preserve Federal hydro generation by:

- Replacing turbine runners to preserve and increase generation and to make the turbine operations more fish friendly;
- Providing increased reliability by decreasing forced and planned outages; and
- Implementing hydro system optimization and operational planning tools to increase generation efficiency as part of Federal operating decisions for the system.
- The Council, BPA, other Federal agencies, and other PNW entities will continue to evaluate ways to enhance fish and wildlife. Future proposals could include additional amendments to the Council's Columbia River Basin Fish and Wildlife Program, revision of the PNCA, renegotiation of Canadian Entitlement allocation agreements, and/or implementation of additional programs in support of the Endangered Species Act. The impacts of future proposals are unknown. These proposals, however, will most likely impact non-power requirements on the hydro system changing a combination of operating flexibility, the monthly shape and timing of streamflows, and the availability of operational Federal system capacity. Future studies will incorporate new known impacts.

Federal 1-Hour Operational Peaking Adjustment: The instantaneous capability of the Federal hydro projects overstates the amount of Federal hydro capacity actually available to meet firm load obligations, month after month, year after year. This is due to the fact that the Federal hydro system has more generating units than hydro fuel (water) available to operate all units on a continuous basis. This issue is addressed by applying an operational peaking adjustment reduction to the Federal hydro capacity to reflect the amount needed to meet the expected 1-hour peak load obligations for each month. This firm capacity calculation provides a better measure of the Federal system and PNW resource peaking capability actually available to meet expected peak load obligations for BPA planning purposes.

Federal 120-Hour Capacity Availability: BPA is also looking at additional methods to depict capacity availability for the Federal system and PNW region using BPA's short-term operational planning processes. BPA's short-term planning estimates the Federal system hydro peaking availability on a monthly 120-hour basis. The 120-hour capacity represents the Federal system hydro generating capability when averaged monthly over the top 6 HLHs per day, 5 days per week, and 4 weeks per month ($6*5*4=120$ hours). This analysis was completed for each of the 50-water conditions. Like the 1-hour operational peaking reduction, 120-hour peaking capacity curves were developed using HOSS hourly Federal hydro generation to obtain 120-hour peaking reductions.

Federal System Annual Firm Energy Surplus/Deficit

Table 2, is a summary of the Federal system annual firm energy surplus/deficits presented in the 2006 White Book, page 65. The analysis used the "Federal System Assumptions" detailed on page 17 of the study document. The Federal system is projected to have minimal energy deficits throughout the study due to lower Federal hydro generation estimates related to the incorporation of changing or additional power and non-power hydro operating requirements from last year's study. In addition, monthly Federal system energy deficits may occur due to water and load variability. The monthly variation of the Federal system

loads and resources is described in the 2006 White Book on page 29. BPA will most likely meet monthly and annual energy deficits using a combination of methods described below in the Federal System Resource Adequacy.

Table 2
2006 White Book
Federal System Firm Energy Surplus/Deficit
Using 1937-Critical Water Conditions
Annual Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Obligations	8,383	8,304	8,310	8,467	8,466	8,184	8,151	8,234	8,271	8,348
Resources	8,359	8,238	8,158	8,319	8,206	8,163	8,040	8,172	8,056	8,181
Surplus/Deficit	-24	-66	-152	-148	-260	-21	-111	-62	-215	-167

Potential Variability of Federal System Resources and Annual Energy Surplus/Deficits

To show the potential variability of the Federal system resources and surplus/deficits, this study compares four different levels of Federal system generation. These levels of generating resources are based on the historical 50-water conditions (August 1928 through July 1978) and use the following water conditions: the base case 1937-critical water; the average of the bottom ten percent; the middle 80 percent; and the top ten percent and are shown on page 24 of the 2006 White Book document.

Federal System Resource Adequacy

The Federal system energy and capacity load and resource projections are considered conservative and assume hydro generation using 1937-critical water conditions, Federal non-hydro resources operating at expected generation levels, and Federal contract obligations and purchases delivered at maximum contract levels. The analysis includes Federal power purchases or new resources that were acquired as of March 31, 2006. Federal system deficits will be met by any combination of the following:

- Better than critical water conditions, which increases water flow and water storage thereby increasing the output of the Federal hydro system;
- Power purchases or the acquisition of generation from operating Independent Power Producer (IPP) projects;
- Market purchases to cover delay or termination of planned resource purchases under long-term contracts;
- Cost-effective conservation and load management programs that reduce BPA's load obligations;
- PSC load obligation variability due to current and future economic conditions; and
- Purchase of off-system storage and exchange agreements that allow for monthly seasonal shaping of Federal hydropower with other PNW entities or other west coast regions.

PNW Region Total Retail Load Forecast

The total retail load forecasts were estimated separately for each PNW entity and grouped into the following customer categories: Federal agency, public agency, cooperative, USBR, IOU, and DSI. The total retail load forecasts for the Federal agencies, USBR, cooperatives, and most public agencies were developed by BPA's Eastern and Western Power Business Line Area Hubs using linear trend methods, based on individual customer's historical annual energy consumption and their 2001 Power Sales Contracts' Exhibit C submittals. Similarly, the forecasts for the IOUs and some generating public agencies were developed from data submitted in the 2005 PNUCC submittals or load forecasts sent directly to BPA. DSI total retail load estimates were based on their current PSCs with BPA through September 30, 2006, and forecasts developed from BPA's Bulk Hub for the remainder of the study period. All total retail load forecasts were finalized on March 31, 2006.

2006 White Book and the Council Regional Total Retail Load Comparison: Table 3 shows a comparison of the non-DSI regional total retail loads for the 2006 White Book and the Council's Final Fifth Northwest Electric Power and Conservation Plan (May 2005) for OY 2007 through 2016. To provide consistency between the load forecasts for comparison purposes, the DSI load components were removed from both forecasts. The comparison of the non-DSI total retail load forecasts shows that the 2006 White Book projections are slightly lower in all years of the study. The average difference over the 10-years of the study is -1.6 percent. The maximum difference is -1.9 percent (-437 aMW) in OY 2016. This difference is considered minor and is mainly due to variations in modeling methods and the vintage of data used in the two forecasts.

Table 3
Non-DSI PNW Regional Firm Load Comparison
BPA's 2006 White Book Load Projections
and the Council's Final Fifth Power and Conservation Plan
Annual Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016

PNW Region Annual Firm Energy Surplus/Deficit

Table 4 is a summary of the PNW region annual firm energy surplus/deficits presented in the 2006 White Book, page 95. This study used the “Regional Analysis Assumptions” detailed on page 35 of the study and 1937-critical water conditions. The PNW regional resource stack assumes that generation from all uncommitted IPP projects are available to meet regional loads unless otherwise specified. Using this resource stack, the region is expected to experience firm energy surpluses through the study horizon. If PNW IPP generation is not available to the region, energy deficits would most likely be met using a combination of methods described in the 2006 White Book on page 50.

Table 4
2006 White Book
PNW Regional Firm Energy Surplus/Deficit
Using 1937-Critical Water Conditions
Annual Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016

Potential Variability of Regional Annual Energy Surplus/Deficit Projections Due to Water Conditions

To show the potential variability of the regional resources and surplus/deficits, this study compares four different levels of regional generation. These levels of generating resources are based on the historical 50-water conditions (August 1928 through July 1978), similar to that in the Federal Section, and use the following water conditions: 1937-critical water; the average of the bottom ten percent; the middle 80 percent; and the top ten percent and are shown on page 40 and 44, respectively, in the 2006 White Book document.

Potential Variability of Regional Annual Energy Surplus/Deficit Projections Due to IPP Generation Levels

This study assumes that all uncommitted IPP generation is available to the region, though only a portion of PNW IPP generating resources are specifically contracted for delivery to the PNW. This study presents regional surplus/deficit scenarios assuming different levels of IPP generation specifically dedicated to the PNW region and is presented on page 45 of the document. Table 5 shows the potential variability of regional firm annual energy surplus/deficits due to the differing levels of IPP generation assumed delivered to the region—25 percent (840 aMW), 50 percent (1,680 aMW), 75 percent (2,520 aMW), and 100 percent (3,366 aMW). For OY 2007, regional surplus/deficit estimates can potentially vary up to 2,500 aMW, annually ranging from an approximate 2,000 aMW surplus to approximately -500 aMW deficit, due to differing possible IPP generation commitments to the PNW.

¹ Sums may not add due to rounding.

Table 5
2006 White Book
Potential Variability of Regional Firm Energy Surplus/Deficit
Utilizing Different Levels of IPP Generation Delivered to the Region
Annual Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
S/D 100% PNW IPP Delivered (3,366 aMW)	2,028	2,262	1,753	1,542	1,156	1,081	697	590	70	5

2006 White Book Key Messages

For the Federal System:

- The Federal system is expected to have minimal energy deficits throughout the study horizon.
- BPA energy surplus/deficits may differ due to:
 - The actual level of PSC obligations for October 1, 2006, through September 30, 2011, which may be higher or lower than those used in this analysis;
 - Uncertainty of future BPA sales to DSI customers;
 - New or updates to contracts obligations or purchases through the Regional Dialogue process;
 - Changes in non-power requirements on Federal hydro projects; and
 - Actual level of Federal system hydro generation realized under current water conditions that can vary by up to 3,900 aMW annually.

For the PNW Region:

- The PNW region is expected to experience firm energy surpluses through the study horizon, using 1937-critical water conditions, assuming all uncommitted IPP generation is available to serve PNW loads.
- Regional energy surplus/deficits may differ due to:
 - The actual level of total retail loads may be higher or lower than those used in this analysis;
 - New or updates to contracts obligations or purchases;
 - Changes in non-power requirements on Federal and non-Federal hydro projects;
 - Availability of fuel (i.e. natural gas, coal, wind, etc.) for other regional resources;
 - Actual level of regional hydro generation realized under current water conditions that can vary by up to 6,800 aMW annually; and
 - The actual amount of uncommitted IPP generation retained within the PNW region. This study assumes approximately 3,360 aMW of uncommitted PNW IPP

generation as regional resources. While this assumption is reasonable from an electrical reliability standpoint, resulting regional surpluses may underestimate the potential for price volatility and overstate the availability of IPP generation for use within the PNW. The PNW region may have to compete with other western markets to secure uncommitted IPP generation to meet electricity demand. Using 1937-water conditions, regional energy surplus/deficits could potentially vary up to 3,360 aMW, depending on IPP generation contracted for or available to meet firm PNW loads.

- Federal system and regional energy deficits are projected for planning purposes and should not be seen as precursors of impending blackouts or other system disturbances.

Additional copies of this document can be obtained from BPA's Public Information Center, 1-800-622-4520. The 2006 Pacific Northwest Loads and Resources Study Technical Appendix presents regional loads, grouped by major PNW utility categories and detailed contract and resource information. The Technical Appendix is available only in electronic form. Both the Technical Appendix and this summary document are available on BPA's external website at: <http://www.bpa.gov/power/whitebook2006>.

THE WHITE Book

BONNEVILLE POWER ADMINISTRATION
March 2006

Cover Picture:

Source: BPA Photo archive

Pictured is the impeller installation of a generator turbine at Grand Coulee Dam, which has been in service since September 28, 1941.

Grand Coulee Dam is a large hydroelectric dam located on the Columbia River in Central Washington and is the largest concrete structure in the United States and the third largest hydroelectric facility in the world. With its 24 generators providing up to 6.5 million kilowatts of power, it is a major provider of electrical power to the Northwest.

ACKNOWLEDGMENTS

Preparation of the annual Pacific Northwest loads and resources study is a complex, multidisciplinary effort. BPA wishes to acknowledge the team—BPA staff and others—whose diligence and dedication result in a reliable, high quality document.

Section 1: Introduction

Naming Convention Revision for the White Book Document

The naming convention of this “*Pacific Northwest Loads and Resources Study*,” commonly called the “White Book” has been revised to reflect the publishing year of the document and includes all data updates through March 31, 2006. Since the timing of this White Book publication is 2006, this year’s White Book is now titled the “*2006 Pacific Northwest Loads and Resources Study*,” or the 2006 White Book, rather than 2005. This change creates less confusion as to the vintage of the data. BPA did not skip a year of this document publication, rather just revised the naming convention.

Description of the White Book

The Pacific Northwest Loads and Resources Study (White Book), which is published annually by the Bonneville Power Administration (BPA), establishes one of the planning bases for supplying electricity to customers. The White Book contains projections of regional and Federal system load and resource capabilities, along with relevant definitions and explanations. The White Book also contains information obtained from formalized resource planning reports and data submittals including those from individual utilities, the Northwest Power and Conservation Council (Council), and the Pacific Northwest Utilities Conference Committee (PNUCC).

The White Book is not an operational planning guide, nor is it used for determining BPA revenues, although the database that generates the data for the White Book analysis contributes to the development of BPA’s inventory and ratemaking processes. Operation of the Federal Columbia River Power System (FCRPS) is based on a set of criteria different from that used for resource planning decisions. Operational planning is dependent upon real-time or near-term knowledge of system conditions that include expectations of river flows and runoff, market opportunities, availability of reservoir storage, energy exchanges, and other factors affecting the dynamics of operating a power system.

The load resource balance of both the Federal system and the region is determined by comparing resource availability to an expected level of total retail electricity consumption. Resources include projected energy capability plus contract purchases. Loads include a forecast of retail obligations plus contract obligations. Surplus energy is available when resources are greater than loads. This surplus energy could be marketed to increase revenues. Energy deficits occur when resources are less than loads. These energy deficits will be met by any combination of the following: better-than-critical water conditions, demand-side management and conservation programs, permanent loss of loads due to economic conditions or closures, additional contract purchases, and/or the addition of new generating resources.

This study incorporates information on Pacific Northwest (PNW) regional retail loads, contract obligations, and contract resources. This loads and resources analysis simulates the operation of the power system in the PNW. The simulated hydro operation incorporates plant characteristics, streamflows, and non-power requirements from the current Pacific Northwest Coordination Agreement (PNCA). Additional resource capability estimates were provided by BPA, PNW Federal agency, public agency, cooperative, U.S. Bureau of Reclamation (USBR), and investor-owned

utility (IOU) customers furnished through annual PNUCC data submittals for 2005 and/or direct submittals to BPA.

The 2006 White Book is presented in two documents: 1) this summary document of Federal system and PNW region loads and resources, and 2) a technical appendix which presents regional loads, grouped by major PNW utility categories, and detailed contract and resource information. The technical appendix is available only in electronic form. Individual customer information for marketer contracts is not detailed due to confidentiality agreements. The 2006 White Book analysis updates the 2004 White Book.

This analysis shows projections of the Federal system and region's yearly average annual energy consumption and resource availability for the study period, OY 2007-2016. The study also presents projections of Federal system and region expected 1-hour monthly peak demand, monthly energy demand, monthly 1-hour peak generating capability, and monthly energy generation for OY 2007, 2011, and 2016. BPA is investigating a new approach in capacity planning depicting the monthly Federal system 120-hour peak generating capability and 120-hour peak surplus/deficit for OY 2007, 2011, and 2016.

This document analyzes the PNW's projected loads and available generating resources in two parts: 1) the loads and resources of the Federal system, for which BPA is the marketing agency; and 2) the larger PNW regional power system loads and resources that include the Federal system as well other PNW entities. The "Federal System Analysis" is presented in Section 4, beginning on page 17. The analysis for the "Pacific Northwest Regional Analysis" is presented in Section 5, page 35. Section 6 presents a comparison of BPA's regional loads with the Northwest Power and Conservation Council beginning on page 51. Section 7, page 55, presents a potential approach to Federal system capacity planning that BPA is investigating which uses a 120-hour capacity analysis.

"The Administrator's Record of Decision (ROD)" for the 2006 White Book is contained in Section 11, page 129.

The glossary of terms and a list of acronyms are included in Section 12, page 135.

This document and the "*2006 Pacific Northwest Loads and Resources Study Technical Appendix*" are available on BPA's external website at <http://www.bpa.gov/power/whitebook2006>.

Additional hard copies of this summary document are available from BPA's Public Information Center, toll-free, 1-800-622-4520.

Section 2: Background

Pacific Northwest Planning Area

The PNW regional planning area is defined by the 1980 Pacific Northwest Electric Power Planning and Conservation Act (Northwest Power Act), and includes Oregon, Washington, Idaho, Montana west of the Continental Divide, and the portions of Nevada, Utah, and Wyoming that lie within the U.S. Columbia River drainage basin. The PNW planning area also includes the service areas of rural electric cooperative customers contiguous to but not in the geographic area described above that were served by BPA on the effective date of the Northwest Power Act, December 5, 1980. 16 U.S.C. §839(14).

White Book Study Assumptions

This traditional loads and resources analysis for the Federal system and PNW region has been produced using a specific set of assumptions concerning contracts and non-hydro and hydro resources. The Federal system assumptions are detailed in "Section 4, Federal System Analysis", page 17. Regional assumptions are presented in "Section 5, Regional Analysis Assumptions", page 35.

Total Retail Load Forecast

For this study, the total retail loads were forecasted separately for each PNW entity. The Hubs for BPA's Eastern and Western Power Business Line Areas estimated the total retail load for the Federal agency, cooperative, USBR, and most public agency customers using linear trend methods based on each of the customers' historical annual energy consumption as well as their 2001 Power Sales Contracts' (PSC) Exhibit C submittals. The forecasts for the IOU and some generating public agency customers were developed from data submitted in their PNUCC submittals or total retail load forecasts furnished to BPA. Direct Service Industries' (DSI) total retail load estimates are based on their current PSCs with BPA through September 30, 2006, and forecasts from BPA's Bulk Hub throughout the study period. All total retail load forecasts are as of March 31, 2006.

Pacific Northwest Hydro and Thermal Resources

PNCA Hydro Operating Characteristics: Beginning in 1997, the PNCA agreement incorporated NOAA Fisheries and U.S Fish and Wildlife Service's Biological Opinions. These Biological Opinion requirements changed the shape of energy production by increasing flows in the spring and summer to aid in the downstream migration of juvenile salmon. A result of these requirements is that reservoirs are no longer fully drafted to meet firm loads in the fall and winter but are operated to retain as much water as possible yet still meet flood control requirements by mid-April. The additional water in storage going into the spring snowmelt runoff results in additional flow in the river during the spring and summer. As a result, the ability to shift and shape hydro energy production to meet firm loads is greatly reduced. The PNCA agreement will remain in place through September 15, 2024.

The hydro regulation study used for this analysis simulates the operation of the hydro system in the PNW. Non-federal hydro projects use plant characteristics, streamflows, and non-power requirements derived from the 2004 PNCA. Federal hydro projects

incorporate these same characteristics, with the exception of non-power requirements, which were updated to reflect BPA's best estimate. The PNCA defines the planning and operation of sixteen U.S. Pacific Northwest utilities and other parties with generating facilities within the PNW region's hydroelectric system. The hydro regulation study incorporates power and non-power requirements that BPA expects to be in effect during the study period, including those measures described by: 1) the National Oceanographic and Atmospheric Administration Fisheries (NOAA Fisheries) Biological Opinion, dated November 2004, as modified by Court-Ordered operations for 2006; 2) the U.S. Fish and Wildlife Service (USFWS) Biological Opinion, published December 2000; 3) operations described in the Council's Fish and Wildlife Program; and 4) other fish mitigation measures. The hydro regulation study specifies hydroelectric project operations for fish, such as seasonal flow augmentation, minimum flow levels for fish, spill for juvenile fish passage, reservoir drawdown limitations, and turbine operation efficiency requirements. These measures include:

- Flow augmentation for juvenile fish migrations in the Snake and Columbia rivers in the spring and summer;
- Mandatory spill requirements at the Lower Snake and Columbia dams to provide for non-turbine passage routes for juvenile fish migrants;
- Additional flows for Kootenai River white sturgeon in the spring;
- Additional flows for Kootenai River and Flathead River Bull Trout;
- Detailed Operating Plan operation for Canadian Treaty reservoirs for Operating Year (OY)¹ 2006; and
- PNCA planning criteria for OY 2004.

The hydro regulation study uses hydro plant operating characteristics in combination with the power and non-power requirements to simulate the coordinated operation of the hydro system. These operating requirements include, but are not limited to, storage content limits determined by rule curves, maximum project draft rates determined by each project, and flow and spill objectives determined by the Biological Opinions as provided by the 2004 PNCA data submittals. Deviations from the PNCA data submittals may occur when specific operating decisions have been made subsequent to the date of submission in order to implement Biological Opinions.

To illustrate the monthly variability of the hydro system using PNCA plant characteristics, streamflows, and BPA's best estimate of non-power requirements, this document presents the Federal system and regional firm surpluses and deficits for OY 2007-2016 for 50-historical water conditions (August 1928 through July 1978). The results are shown in Exhibits 8 through 17, pages 81-90, for the Federal system, and in Exhibits 25 through 34, pages 111-120, for the region.

Hydro Energy: This study estimates the monthly energy capability of the Columbia River Basin's regulated and independent hydro projects, based on their average monthly river discharge that reflects river constraints and storage limitations. The generation from these hydro projects is estimated for each OY, by water year, for 1929 through 1978 historical water conditions. Water-year conditions span periods similar to OYs, in that the 12-month water year for 1937-water conditions spans August 1936 through July 1937. This study uses one of the lowest water years, 1937-water

¹ Operating Year (OY) is the 12-month period August 1 through July 31. For example, OY 2007 is August 1, 2006, through July 31, 2007.

conditions, to represent a period of adverse water conditions during which the hydro system would produce low amounts of hydro generation and estimates the Federal system's firm hydro energy capability using such conditions. This is called the "critical period".

Hydro 1-Hour Operational Capacity: The study estimates the monthly instantaneous capacity of Columbia River Basin regulated and independent hydro projects based on their full-gate-flow maximum generation at its mid-month reservoir elevation using 1929 through 1978 historical water conditions. The hydro generation reflects river constraints and storage limitations, within any water condition, that may limit the release of water to achieve maximum capacity. BPA assumes 1937-water levels to estimate the regional hydro capacity because that year approximates a peaking capability that is consistent with the reliability criteria set forth in the PNCA.

The instantaneous capability of the Federal hydro projects, however, overstates the amount of Federal hydro capacity actually available to meet firm load obligations, month after month, year after year. This is due to the fact that the Federal hydro system has more generating units than hydro fuel (water) available to operate all units on a continuous basis. An operational peaking adjustment reduction is made to the Federal hydro capacity estimates to better reflect BPA's ability to meet expected peak load obligations throughout each month.

The operational peaking adjustment was developed using a series of Hourly Operating and Scheduling Simulator (HOSS) studies. The HOSS model simulates hourly Federal system generating resource operations that are needed to meet Federal system obligations for each of the 50 historical water conditions. The HOSS model maximized Federal system hydro generation by selling surplus energy in better than average water conditions. In low water conditions, HOSS maximized hydro generation and purchased energy to meet the monthly peak load demands.

The HOSS studies produced an hourly matrix of Federal system hydro generation by month, by water condition. Monthly relationships between the Federal system hydro energy and the Federal hydro maximum 1-hour generation were developed for each water condition. This method estimates the Federal hydro system monthly maximum operational capacity that is available to meet the 1-hour expected peak load for each of the 1929 through 1978 historical water conditions.

This methodology for calculating firm hydro capacity provides a better measure of the Federal system and PNW resource peaking capability for BPA planning purposes. The operational peaking adjustment takes into account hydro maintenance, spinning reserves, and forced outage reserves, which are netted out for reporting purposes. Due to the operational peaking adjustment change implemented in the 2004 study, Federal and regional capacity surplus/deficit values are not comparable with studies prior to the 2004 White Book.

Hydro 120-Hour Capacity Availability: BPA is looking at additional methods to depict capacity availability for the Federal system and PNW region using BPA's short-term operational planning processes. BPA's short-term planning estimates the Federal system hydro peaking availability on a monthly 120-hour basis. The 120-hour capacity represents the Federal system hydro generating capability when averaged monthly over the top 6 HLHs per day, 5 days per week, and 4 weeks per month ($6*5*4=120$ hours). This analysis was completed for each of the 50-water conditions. Like the 1-hour operational peaking reduction, 120-hour peaking capacity curves were developed using HOSS hourly Federal hydro generation to obtain 120-hour peaking

reductions. This is discussed further in Section 7: Potential Capacity Planning for the Future, page 55.

Hydro Projects' Multiple-Use Planning: Federal hydro projects in the PNW have many uses in addition to power generation. The projects provide flood control, supply irrigation for farming, assist in river navigation, provide for reservoir recreation, and contribute to municipal water supplies. In addition, operational constraints are in place to protect and enhance resident and anadromous fish and wildlife populations. Non-power reservoir operating requirements may reduce or increase hydropower production. BPA's resource planning takes into account all presently known non-power operating requirements in assessing regional hydro system capability.

The Council, BPA, other Federal agencies, and other PNW entities will continue to evaluate ways to enhance fish and wildlife. Future proposals could include additional amendments to the Council's Columbia River Basin Fish and Wildlife Program, revision of the PNCA, renegotiation of Canadian Entitlement allocation agreements, and/or implementation of additional programs in support of the Endangered Species Act. The impacts of future proposals are unknown. These proposals, however, will most likely impact non-power requirements on the hydro system, potentially changing a combination of operating flexibility, the monthly shape and timing of streamflows, and the availability of operational Federal system capacity. Future studies will incorporate any known new impacts.

Hydro Improvements: BPA has budgeted \$1.2 billion over the next 7 to 9 years for maintaining and improving the reliability of the Federal hydro system. These improvements were revised for this study and are expected to increase and preserve Federal hydro generation by:

- Replacing turbine runners to preserve and increase generation and to make the turbine operations more fish friendly;
- Providing increased reliability by decreasing forced and planned outages; and
- Implementing hydro system optimization and operational planning tools to increase generation efficiency as part of Federal operating decisions for the system.

Using critical water conditions, it is estimated that by OY 2007, the combination of these hydro improvements will annually preserve and create up to 98 average megawatts (aMW), of which 77 aMW are potential additional Federal hydro generation and the remaining 21 aMW are associated with preserving the existing level of hydro generation capability from degradation. In OY 2016, it is estimated that these improvements will annually preserve and create up to 246 aMW, of which 170 aMW are potential additional generation and the remaining 76 aMW, preserving hydro generation from degradation.

Using average water conditions, it is estimated that by OY 2007, the combination of these hydro improvements will annually preserve and create up to 286 aMW, of which 107 aMW are potential additional generation and the remaining 179 aMW, preserving hydro generation from degradation. In OY 2016, it is estimated that these improvements will annually preserve and create up to 941 aMW, of which 229 aMW are potential additional generation and the remaining 712 aMW, preserving hydro generation from degradation.

The total amount and timing of annual aMW actually realized over the next 7 to 9 years will be dependent on the timely completion of the scheduled installations, the success of the optimization changes, and hydrologic conditions. These estimated

increases in generation are associated with the current level of fishery operations. If future fishery operations further decrease the flexibility of the hydro system operations and/or increase the amount of spill, the annual megawatt contribution of the hydro improvements realized will most likely be lower. Hydro improvement estimates will be updated in future studies.

Non-Hydro Resources: The expected output of regional non-hydro resources is based on the energy and capacity capability information submitted to BPA by the project owners. These projects include: nuclear, coal, gas-fired, oil-fired, and renewable resources such as wind, geothermal, solar, and biomass projects. Total plant output was reduced to account for scheduled maintenance, spinning reserves, and forced outage reserves. Independent Power Producer (IPP) projects that have been built or that are in the process of construction have been added to the regional resource stack. IPP projects are assumed dedicated to meet PNW regional loads unless otherwise specified. The discussion of the Federal resources is in Section 4, page 21. Regional resources are discussed in Section 5, page 38.

Analysis of Federal System Firm Loads and Resources

In the PNW, BPA is the Federal power-marketing agency charged with marketing power and transmission to serve the firm electric load needs of its customers. BPA does not own generating resources. BPA's contractual customer load obligations, combined with the Federal and non-Federal resources from which BPA acquires the power it sells, are collectively called the "Federal system" in this study. BPA owns and operates the primary transmission grid, which includes more than 14,800 circuit miles of transmission lines above 115 kilovolts (high voltage) and 600 circuit miles below 115 kilovolts in the PNW.

The Federal system load obligations are comprised of BPA's sales to PNW Federal agency, public agency and cooperative, USBR, IOU, and DSI customers as well as other firm contractual obligations to deliver power. BPA sells Federal power at wholesale and has no retail customers.

BPA is the designated marketer of the generation from hydro resources of the Federal system, which includes 31 dams owned and operated by the USBR and the U.S. Army Corps of Engineers (USACE). BPA also markets the generation from: hydro projects owned by the City of Idaho Falls, through September 30, 2006, and Lewis County Public Utility District (PUD); thermal generation from the Columbia Generating Station nuclear plant operated by Energy Northwest, Inc. (ENW); and the output from several renewable power plants (primarily cogeneration and wind turbines) under power purchase contracts with BPA. The expected energy generation production from wind turbines is included in the analysis; however, since wind power production is intermittent and cannot be guaranteed to be available to meet peak hour loads, no capacity contribution from wind generation is assumed. The Federal system analysis is shown in Section 4, beginning on page 17.

BPA Power Sales Contract Obligations

BPA signed either 5- or 10-year PSCs with its PNW customers that began October 1, 2001. The following is a description of some of the contractual uncertainties associated with specific customer classes:

- Federal agency, public agency, cooperative, and USBR customers signed either 5- or 10-year PSCs. Some of the public agencies, and cooperatives signed up for

the 10-year Slice of the System Product (see "The Slice Product", page 8). BPA's PSC and Slice PSC obligations end September 30, 2011; however, this study assumes that BPA will meet these or similar regional load contract obligations through OY 2016. In actual operation, BPA's contract obligations to serve these customers may be higher or lower than those shown in this analysis;

- The IOU's signed the 10-year Residential Purchase and Sales Agreement (RPSA) settling BPA's obligations under the Northwest Power Act to the IOUs. As a result of negotiations in 2001, the IOU RPSA firm power deliveries were reduced in exchange for financial considerations resulting in a net IOU RPSA settlement power delivery of 258 aMW, per month, through September 30, 2006, or a 43 aMW annual average for the partial year of OY 2007. For the period October 1, 2006, throughout the study horizon, this study assumes that BPA's IOU RPSA settlement contracts provide only financial benefits and no power is delivered. This assumption is consistent with the amendments made to the RPSA contracts by BPA and the IOUs on May 28, 2004; and
- BPA's DSI customers signed 5-year power sales contracts effective from October 1, 2001, through September 30, 2006. For August 1, 2006, through September 30, 2006, BPA's DSI load obligations reflect load reduction agreements, contract terminations, and curtailments and are estimated to be 265 aMW, monthly, resulting in a 44 aMW annual average for the partial year of OY 2007. For October 1, 2006, through September 30, 2011, this study incorporates the policies adopted in BPA's "*Service to Direct Service Industrial (DSI) Customers for Fiscal Years 2007-2011, Administrator's Record of Decision*", published June 30, 2005, and the "*Supplement to Administrator's Record of Decision on Bonneville Power Administration's Service to Direct Service Industrial (DSI) Customers for Fiscal Years 2007-2011*", (Supplemental DSI ROD) dated May 31, 2006. Beginning October 1, 2006, this study assumes that BPA will offer Port Townsend Paper Corporation 17 aMW of surplus firm power via a local preference customer. This delivery is shown as an Intra-regional transfer from BPA to a local preference customer for Port Townsend and is not shown specifically as a DSI PSC load obligation. Actual DSI load obligations may differ from those presented in this study due to additional purchases or curtailments caused by changes in economic conditions.

Decisions and agreements may be reached through the Regional Dialogue process between BPA and its customers and other regional stakeholders on the nature of BPA's electrical service products post-2006. Any decisions adopted from the Regional Dialogue discussions will be incorporated in future studies.

The Slice Product

The Slice Product (Slice) is a public preference PSC product that provides both firm requirements power for firm and non-firm energy to a customer based on their net requirements load for the 10-year period October 1, 2001, through September 30, 2011. It differs from traditional PSC products in that it is comprised of the following components: 1) firm power deliveries based on the level and shape of the Slice System Resources stack; and 2) non-firm power deliveries on a monthly or seasonal basis based on actual generation of the Slice System Resources stack.

Slice Power Deliveries: Customers signed 10-year Slice contracts for power deliveries based on 22.63 percent of the Slice System Resources stack. The Slice System Resources stack is comprised of a set of specific Federal resources, net of a

specific set of Federal obligations. This particular set of resources and obligations is used only for the Slice product and is not the same as the Federal system resource stack. The specific set of Federal resources that comprise the Slice System Resources stack includes: the generation from Federal hydro projects, Columbia Generating Station, Georgia Pacific Corporation's Wauna Mill, Federal Non-Utility Generation, and power deliveries from the Non-Federal Canadian Entitlement Return (CER) for Canada contracts. The specific set of Federal contract obligations, which are subtracted from the Slice System Resources stack for this purpose, includes but is not limited to deliveries for the CER to Canada (shown as an Export) and Federal pumping loads. The amount of Slice product available for delivery is dependent on the Federal system operating decisions, hydro production that varies by water conditions, and generation from non-hydro Federal resources.

Block Slice Contracts Deliveries: All Slice customers signed 10-year contracts for the Block Slice contract purchases having a 100 percent load factor for each month. Under the Slice Block contract, customers had the option for either a 5- or 10-year purchase option. Most Slice customers chose the 10-year Slice Block purchase option. This option allowed customers to increase their Block for the period October 1, 2006, through September 30, 2011, to cover load growth during the first 5-years of their Slice contract. The remaining Slice customers chose to purchase the same amount of Block for the latter 5-year period, October 1, 2006, through September 30, 2011, at BPA's current applicable rate.

Analysis of Regional Firm Loads and Resources

The PNW regional analysis includes the Federal system loads and resources, plus non-Federal regional loads, contractual obligations, and generating resources in the PNW region. The region has several groups that represent load sectors: Federal agencies, public agencies, cooperatives, USBR, IOUs, and DSIs. The regional hydro resources are owned and operated by various Federal entities, public agencies, cooperatives, and IOUs. The regional thermal generating resources, fueled by biomass, coal, natural gas, oil, or nuclear power, are owned and operated by various regional entities. The regional analysis is presented in Section 5, beginning on page 35.

Canadian Treaty Downstream Benefits

The Columbia River Treaty between the United States and Canada enhanced the use of storage in the Columbia River Basin with the construction of three large storage projects in Canada (Mica, Duncan, and Keenleyside). These Canadian Treaty projects provide downstream power benefits by increasing the firm power generating capability of U.S. hydro projects. Under the terms of the Treaty, the downstream power benefits are shared equally between the two countries. The Determination of Downstream Power Benefits analysis is performed annually and establishes the amount of benefits for each succeeding sixth year. The non-Federal mid-Columbia projects are Wells, Rocky Reach, Rock Island, Wanapum, and Priest Rapids. BPA and each of the non-Federal mid-Columbia participants are obligated to return their share of the downstream power benefits owed to Canada. This is called the Canadian Entitlement Return to Canada. The non-Federal Canadian Entitlement obligations are delivered to BPA, who, in turn, delivers both BPA's and the non-federal participants' obligations to Canada. The non-Federal entities' Canadian Entitlement obligation is included in each participating utility's loads and resources balance as a delivery to

BPA. BPA's delivery of the Canadian Entitlement Return obligation to Canada is presented in Table 1, below, and is considered a Federal export.

Major Sources of Uncertainty

This study reflects several potential major changes in regional resources and power sales products that could affect regional and Federal loads and resources.

Loads and Resources Uncertainty: Future Federal system and regional firm surpluses/deficits are subject to a number of uncertainties over the 10-year study period. Some of these uncertainties include:

- Changes in loads or available resources resulting from deregulation of retail sales in the electric power industry;
- Federal system and regional water availability that affects hydro generation available to meet load obligations. See “Potential Variability of Federal System Resources”, page 24, and “Potential Variability of Regional Resources”, page 40;
- Volatility in short- and long-term electricity market prices;
- Deviation from forecasted loads due to changes in the economy;
- Failure of existing or contracted generating resources to operate at anticipated times and output levels;
- The availability of new and existing regional resources that can be purchased to serve firm loads in the PNW region;
- Implementation of decisions and agreements that may be reached through the Regional Dialogue process for BPA’s future electrical service products post-2011;
- Additional changes to existing hydro system operation in response to programs developed to address the Endangered Species Act or other environmental considerations; and
- The success of BPA’s future purchasing and marketing efforts that include: contract purchases, contract sales, demand-side management programs, conservation measures, and the purchase of the output of new or existing resources.

These uncertainties could affect both the size of projected surpluses or deficits and the times at which they occur.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 3: Changes in the 2006 Pacific Northwest Loads and Resources Study

This section describes the major data updates and changes in the assumptions for the 2006 White Book analysis compared to the 2004 White Book. Specific resource and contract changes are detailed in the 2006 Pacific Northwest Loads and Resources Study Technical Appendix. The 2006 Technical Appendix will be available on BPA's external website at <http://www.bpa.gov/power/whitebook2006>. The 2006 Technical Appendix presents auxiliary tables (A-tables) that contain aggregate information summarized by customer type.

Federal Firm Sales and Obligations

The 2006 White Book analysis reflects the following Federal system contract and obligation changes compared to the 2004 study:

- Federal agency, public agency, cooperative, and USBR PSC obligations were updated using linear trend methods based on historical power consumption under their PSCs. Though all of these PSC contract obligations actually expire September 30, 2011, this study assumes that BPA will meet these net requirement obligations with similar agreements through OY 2016;
- Federal public agency and cooperative Slice customer obligations were revised for this study using methods described in "The Slice Product", page 8. Though these Slice obligations actually expire September 30, 2011, this study assumes that BPA will meet similar Slice obligations with agreements through OY 2016;
- For the period October 1, 2006, through September 30, 2011, this study assumed that BPA's IOU RPSA settlement contracts provide only financial benefits and no power is delivered throughout the study horizon. This assumption is consistent with the amendments made to the RPSA contracts by BPA and the IOUs on May 28, 2004;
- BPA's DSI load obligations were updated to reflect signed load reduction agreements, contract terminations, and closures through March 31, 2006. DSI service estimates for October 1, 2006, through September 30, 2011, incorporate the policies adopted in BPA's Supplemental DSI ROD, dated May 31, 2006; and
- Updated Federal system contract sales.

Federal Resource Stack

The 2006 White Book analysis reflects the following Federal system resource stack changes compared to the 2004 study:

- Regulated hydro resource updates: The hydro regulation study was updated to incorporate BPA's most recent estimate of power and non-power requirements expected to be in effect during the study period;
- Independent hydro resource updates: Acquisition contracts for the output from the Elwha (8.6 aMW) and Glines Canyon (15.0 aMW) hydro projects were extended from July 31, 2006, to September 30, 2009. The actual removal date of these projects is provided by the U.S. National Park Service;

- NUG renewable resource update: Estimated start date for the Fourmile Hill Geothermal plant (50 aMW) was revised from October 1, 2007, to October 1, 2009. There is potential for contract termination of this resource purchase due to project delays, thus making the completion date uncertain;
- Independent hydro resource removal: Bonneville Fishway project (22 aMW) was removed as a Federal resource to avoid double counting of the generation, which was previously included in the regulated hydro Bonneville Dam generation estimates;
- NUG hydro resource removal: Hellroaring (Big) Creek hydro project (0.2 aMW) generation changed from a Federal Independent Hydro resource to Mission Valley and remains a regional resource;
- Independent hydro resource ownership change: Output from the Idaho Falls Bulb Turbine projects (18.5 aMW) changed from a Federal Independent Hydro resource to the City of Idaho Falls due to the expiration of BPA's acquisition contract September 30, 2006. The project remains a regional resource; and
- Updated Federal system contract purchases.

Future studies will reflect new information as it becomes available.

PNW Total Retail Load

The 2006 White Book utilizes updated customer-by-customer regional retail load forecasts. The forecasts are based on a combination of their historical electrical load consumption, submittals provided for the 2001 PSCs, and/or their 2005 PNUCC data submittals. If available, the information and growth trends were verified with Federal Energy Regulatory Commission (FERC) filings. Below highlights the methods used to arrive at the load forecasts. The forecasts reflect applicable load reduction agreements and were aggregated together for each of the following customer classes.

- Federal agency, public agency, cooperative, and USBR retail load forecasts were developed by BPA using linear trend methods that incorporate historical retail load data and their 2001 PSCs' Exhibit C submittals. Some public agency customer loads were developed from their 2005 PNUCC data submittals;
- IOU retail load forecasts were developed by BPA using data provided in their 2005 PNUCC data submittals;
- DSI retail load estimates were updated by BPA and are based on their current PSCs with BPA; and
- Updated PNW regional export contracts.

PNW Regional Resource Stack Changes

In addition to the Federal system resource stack updates presented on page 13, the 2006 White Book analysis reflects the following regional resource changes compared to the 2004 study:

- NUG hydro resource additions: Albany (0.3 aMW), Boulder Creek (0.2 aMW), and Rocky Brook (0.25 aMW);
- NUG cogeneration additions: Haleywest Cogeneration (4.1 aMW) and Potlatch (52.7 aMW);
- NUG renewable resource addition: Pine Products (0.01 aMW);
- NUG wind project additions: Eurus Combine Hill (12.7 aMW), Hopkins Ridge (31.2 aMW), Klondike Phase 2 (19.9 aMW), Wild Horse (39.0 aMW) and beginning OY 2008, White Creek (23.5 aMW);
- Combustion turbine resource addition: Boundary C-T (0.01 aMW);
- Regulated hydro resource updates: Kerr (105 aMW) and Thompson Falls (50.1 aMW) which were inadvertently left out as regional resources;
- Regulated hydro resource removal: Decommissioning of Puget Sound Energy's White dam (32.1 aMW);
- Updated PNW regional import contracts; and
- Several generating projects were reclassified within the study. These changes had no effect on the regional generation totals.

Future studies will reflect new information as it becomes available.

Potential Capacity Planning for the Future

BPA is exploring alternative study methods to better portray capacity availability, duration, and adequacy to meet loads for the White Book and other planning processes which is presented in Section 7, page 55. While this study process is presently under way, this example shows how a 120-Hour peak capacity availability could be translated for BPA's long-range planning in the White Book

THIS PAGE INTENTIONALLY LEFT BLANK

Section 4: Federal System Analysis

Federal System Assumptions

The Federal system loads and resources analysis is based on Federal resources, Federal contracts, and Federal power sales contract obligations as of March 31, 2006. The assumptions used for the Federal system analysis are as follows:

- Forecasted Federal load obligations reflect normal weather conditions;
- Regulated hydro generation estimates incorporate PNCA plant characteristics, streamflows, and BPA's best estimate of non-power requirements. The estimated output for independent hydro and other generating projects are provided to BPA by the project owners;
- BPA's Federal agency, public agency, cooperative, and USBR PSC obligations, that expire September 30, 2011, continue to be met by BPA with similar contract obligations through OY 2016;
- BPA's public agency and cooperative Slice obligations, that expire September 30, 2011, continue to be met by BPA with similar Slice contract obligations through OY 2016;
- For the period October 1, 2007, through September 30, 2011, BPA's IOU RPSA settlement contracts reflect only financial benefits and no power is delivered. This assumption continues through OY 2016 and is consistent with the amendments made to the RPSA contracts by BPA and the IOUs on May 28, 2004;
- BPA's DSI PSC obligations reflect signed load reduction agreements, contract terminations, and closures. DSI purchases total up to an annual maximum of 265 aMW per month through September 30, 2006. DSI service estimates for October 1, 2006, through September 30, 2011, incorporate the policies adopted in BPA's Supplemental DSI ROD, dated May 31, 2006;
- All existing Federal contractual arrangements not included under BPA's regional net requirements power sales contracts expire by the terms of their agreements and are not renewed;
- Federal power sales and capacity/energy exchange agreements with the cities of Burbank, Glendale, and Pasadena are shown as capacity/energy exchanges until they expire on April 15, 2008;
- Federal surplus capacity sale contract with PacifiCorp expires August 31, 2011;
- Firm hydro energy and capacity estimates are based on 1937-critical water conditions, unless otherwise specified;
- Federal hydro capacity is reduced, by an operational peaking adjustment, to better estimate the monthly maximum operational capability that is available to meet the 1-hour expected peak load, for each of the 1929 through 1978 historical water conditions; and
- Transmission losses are treated as a resource reduction.

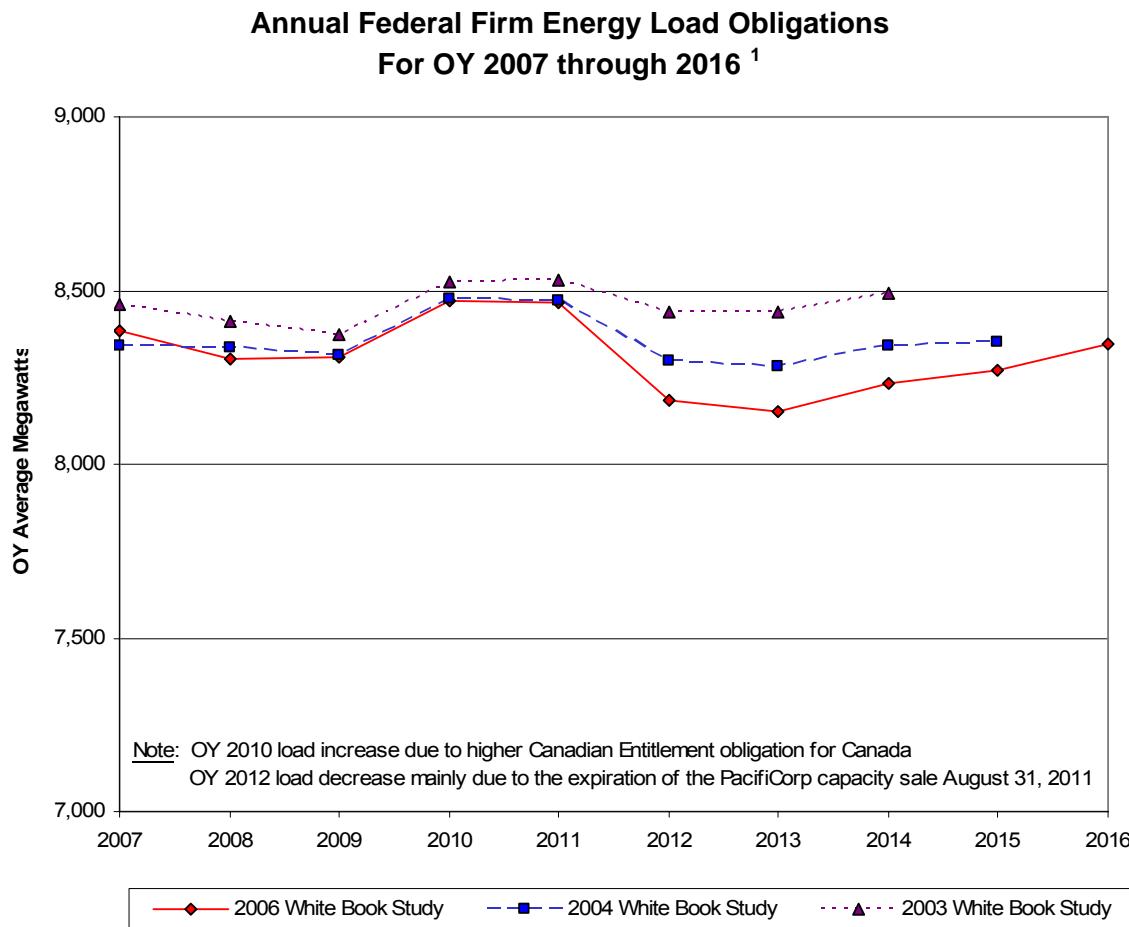

Annual Federal Firm Energy Load Obligations

In this study, the annual Federal system firm energy load obligations incorporate the preceding "Federal System Assumptions" and include BPA's forecasted 2001 PSC obligations, including "The Slice Product" discussed on page 8, for PNW Federal

agencies, public agencies, cooperatives, USBR, IOUs, and DSIs. The forecast assumes that PNW Federal agencies, public agencies, cooperatives, and the USBR purchase power from BPA under their PSCs to meet net regional firm energy loads not served by their own resources. The Federal obligations also include contracted Federal deliveries within the PNW region and export contracts delivered outside the PNW. The methods and assumptions used to complete this year's Federal power sales contract obligations are based on the forecasts of individual entity's total retail load discussed in "Total Retail Load Forecast", page 3.

Figure 1, below, illustrates the difference between the forecasted 2006 White Book annual Federal system energy load obligations for OY 2007 through 2016 from the previous 2004 and 2003 Studies. The expected lower Federal load obligations for OY 2007 through 2016 reflect changes in BPA's small public agency, cooperative, DSI, and export contracts. The annual Federal firm energy load obligations for OY 2007 through 2016 are presented in Exhibit 1, page 65.

Figure 1

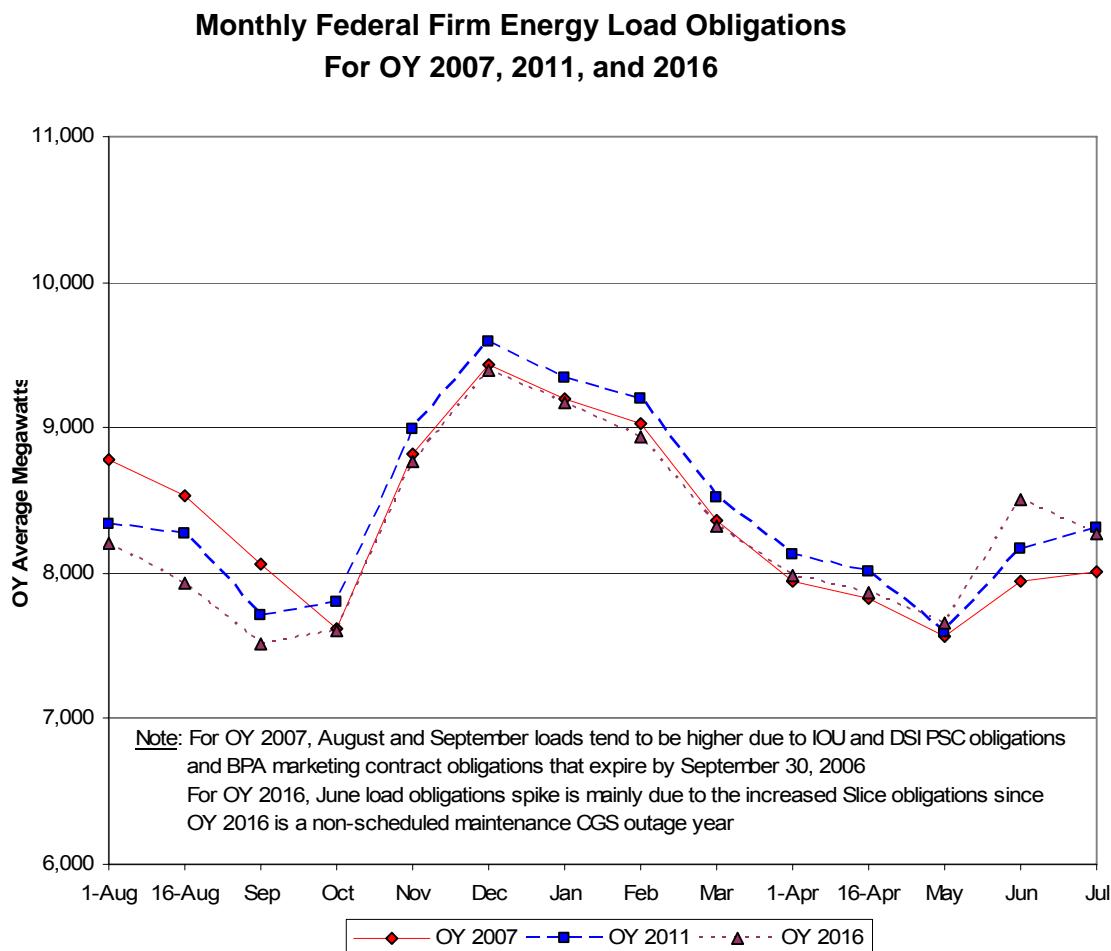

¹ 2003 White Book projections were published through OY 2014. 2004 White Book projections were published through OY 2015.

Monthly Federal Firm Energy Load Obligations

Figure 2, below, illustrates the monthly Federal firm energy load obligations for OY 2007, 2011, and 2016 and incorporates the same load components detailed in the sections on “Federal System Assumptions” and the “Annual Federal Firm Energy Load Obligations” presented on page 17.

Figure 2

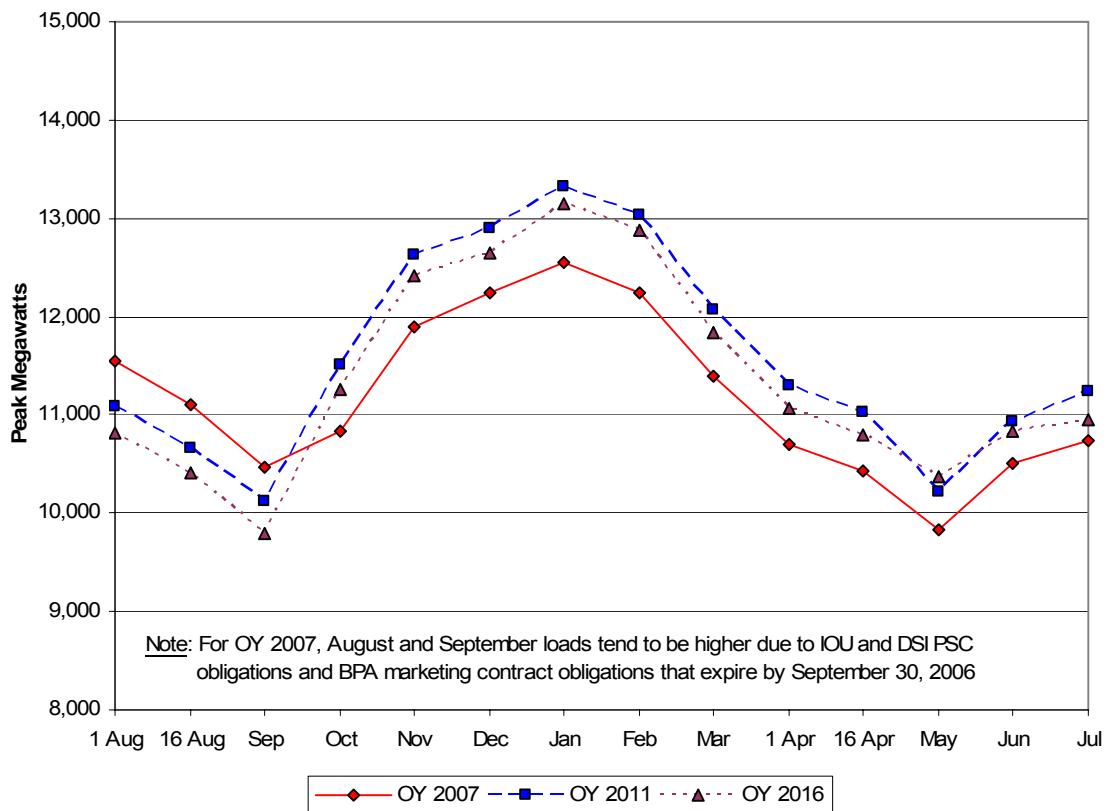

The monthly Federal firm energy load obligations for OY 2007, 2011, and 2016, assuming 1937-critical water conditions, are shown in Exhibits 2 through 4, pages 69-71.

Monthly Federal Firm 1-Hour Peak Load Obligations

Figure 3, page 20, illustrates the monthly Federal firm 1-hour peak load obligations for OY 2007, 2011, and 2016 and employs the same load components detailed in “Federal System Assumptions” and the “Annual Federal Firm Energy Load Obligations” detailed on page 17. The figure shows the expected 1-hour monthly maximum demand using BPA’s 2006 White Book Study load obligations. The forecast assumes that PNW Federal agencies, public agencies, cooperatives, and the USBR purchase capacity from BPA under their PSCs to meet regional peak loads not served by their own resources with the exception of the Slice product customers. Federal peak load obligations include BPA’s exports and intra-regional

contract sales. The peak load obligations assume normal weather conditions and a 50-percent probability that the actual peak load obligations could be exceeded. The peak load projections are reduced by a 1-hour diversity component to address the fact that all electrical peak demands do not occur simultaneously throughout the region.

Figure 3
Monthly Federal Firm 1-Hour Peak Load Obligations
For OY 2007, 2011, and 2016

For OY 2007, August and September Federal peak load obligations are higher, mainly due to IOU and DSI PSC obligations that expire September 30, 2006. The monthly Federal firm peak loads are presented in Exhibits 5 through 7, pages 75-77.

Federal Firm Resources

Table 3, below, summarizes the Federal system firm energy resources and contract purchases available to BPA to meet Federal load obligations for OY 2007. Federal system energy resources are comprised of approximately 80 percent hydropower, over 10 percent from one nuclear power plant, and less than 10 percent from BPA's contracts and small thermal and renewable resources.

Table 3

Federal Firm Total Resources for OY 2007¹
Based on 1937-Critical Water Conditions
Capacity Based on January 2007

Project Type	1-Hour Operational Peaking Capacity (January Peak MW)	Percent of Operational Peaking Capacity	Firm Energy (OY in aMW)	Percent of Firm Energy
Hydro	12,662 ²	89.7%	6,877	80.0%
Nuclear	1,150	8.1%	877	10.2%
Contracts/Small Thermal Resources	309	2.2%	847	9.8%
Total Federal Firm Resources	14,121	100%	8,601	100%

The Federal system hydro resources from which BPA markets power are detailed in Table 4, page 22. BPA also markets power purchased from non-Federally owned resources. In addition, BPA's capacity/energy exchange contracts provide marketable energy to BPA as payment for the capacity BPA delivers. Table 5, page 23, shows the non-Federally owned resources, return energy associated with BPA's existing capacity/energy exchanges, contractual resources, and other BPA hydro-related contracts.

Combined, these resources represent BPA's available firm resources. A detailed listing of Federal generating resources is in BPA's "2006 Pacific Northwest Loads and Resources Study Technical Appendix" and is available on BPA's external website at <http://www.bpa.gov/power/whitebook2006>.

¹ Federal firm resource estimates are before adjustments for reserves, maintenance, and transmission losses.

² The Federal hydroelectric capacity is reduced by an operational peaking adjustment to better estimate the monthly maximum operational capability that is available to meet the expected 1-hour peak load, for 1937-water conditions. The January 2007 reduction is -8,659 MW.

Table 4

Federal System Hydro Projects
Capacity and Energy Based on OY 2007

Project	Initial Year of Service	Number of Units	Nameplate Rating (MW)	OY 2007

Klondike Phase 1 ³	Wind	NW Wind Power	2001	0	7
Fourmile Hill Geothermal	Geo.	Calpine	2009 ⁴	0	0
Ashland Solar Project	Solar	Ashland, Oregon	2000	0	0.003
Total Non-Federally Owned BPA Resources				1,227	1,006
Firm Contracts					
Canadian Entitlement for Canada (non-Federal)				234	134
Canadian Imports				1	1
Pacific Southwest Imports				0	50
Inland Southwest Imports				45	81
Eastern Imports				189	94
Intra-Regional Transfers In (Pacific Northwest Purchases)				10	522
Total BPA Firm Contracted Resources				479	882
Total Non-Federally Owned BPA Resource Contracts				1,706	1,888

¹ This is the maximum generation using optimum conditions for January 2007. Hydro projects assume 1937-critical water conditions.

² Elwha and Glines Canyon generation acquisition contracts are scheduled to expire September 30, 2009, with the eventual removal of the projects.

³ Since wind projects cannot predictably meet peak loads, BPA does not recognize a peaking capacity credit for wind.

⁴ Fourmile Hill is assumed to be operational October 1, 2009. It is anticipated to have a January peak of 50 MW and annual energy of 50 aMW. There is potential for termination of the contract with Calpine for this resource purchase due to project delays making the completion date uncertain. Future studies will reflect new information on this project as it becomes available.

Potential Variability of Federal System Resources

To illustrate the potential variability of Federal system resources, this study compares different scenarios using varying levels of Federal system generation based on differing water conditions. Table 6, below, compares the estimated annual Federal system resources under four scenarios using 1937-critical water conditions, the base case of this study, and the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions (1929 through 1978).

Table 6

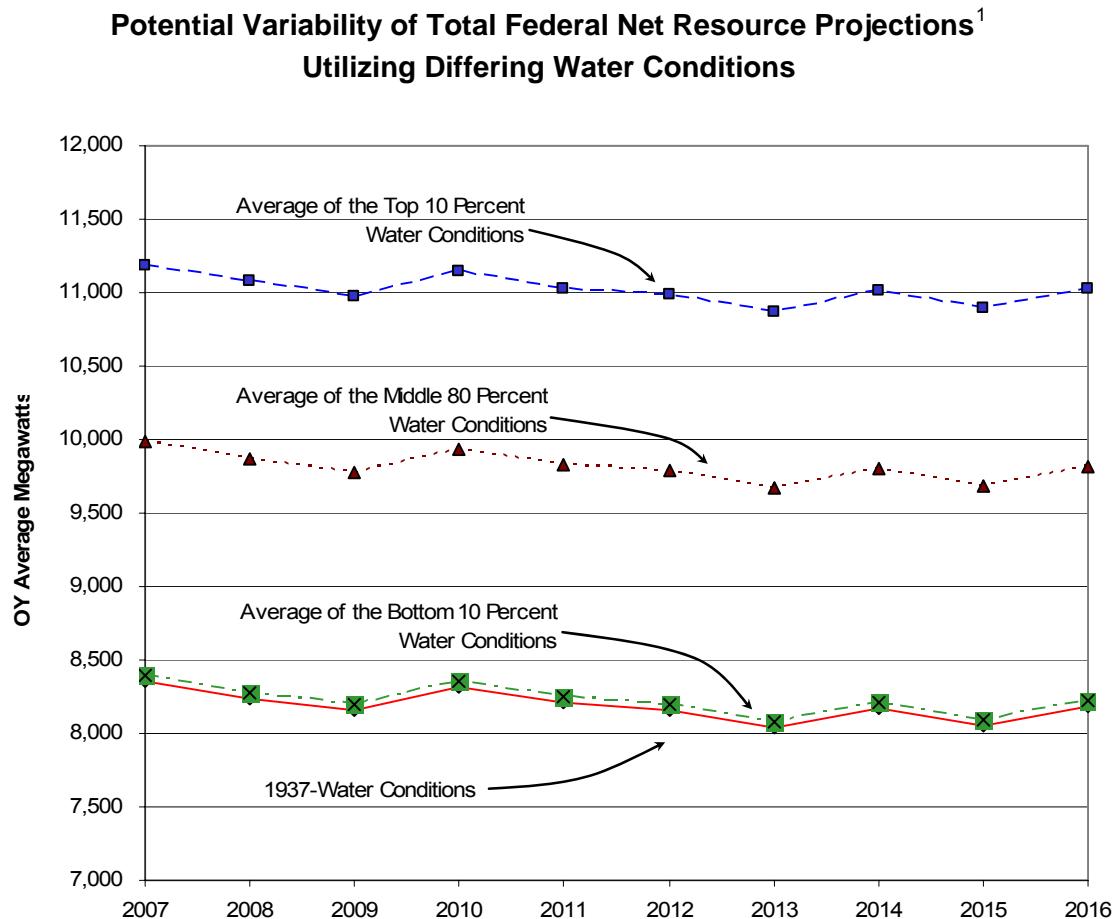

Potential Variability of Total Federal Net Resource Projections¹
Utilizing Different Levels of Water Conditions
Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
1937-Critical Water Conditions	8,359	8,238	8,158	8,319	8,206	8,163	8,040	8,172	8,056	8,181

Average Middle 80% Water Conditions	9,987	9,870	9,776	9,940	9,828	9,786	9,667	9,802	9,689	9,816
Average Top 10% Water Conditions	11,190	11,075	10,973	11,140	11,030	10,988	10,871	11,009	10,896	11,025

¹ Total Federal net resource estimates include adjustments for reserves, maintenance, and transmission losses.

Figure 4, below, illustrates the four scenarios for the annual Federal system resources.

Figure 4

Annual Federal Firm Energy Surplus/Deficit Projections

Using the “Federal System Assumptions” detailed on page 17, the projections for annual Federal firm energy surplus/deficits for OY 2007 through 2016 are presented in Table 7 on page 26. The Federal system is projected to have minimal energy deficits throughout the study period due to lower Federal hydro generation estimates due to the incorporation of changing or additional power and non-power hydro operating requirements. BPA will most likely meet these deficits using a combination of methods described in “Federal Resource Adequacy”, page 34.

¹ Total Federal net resource estimates include adjustments for reserves, maintenance, and transmission losses.

Table 7

Potential Variability of Annual Federal Energy Surplus/Deficit Projections
Utilizing Differing Water Conditions
For OY 2007 through 2016

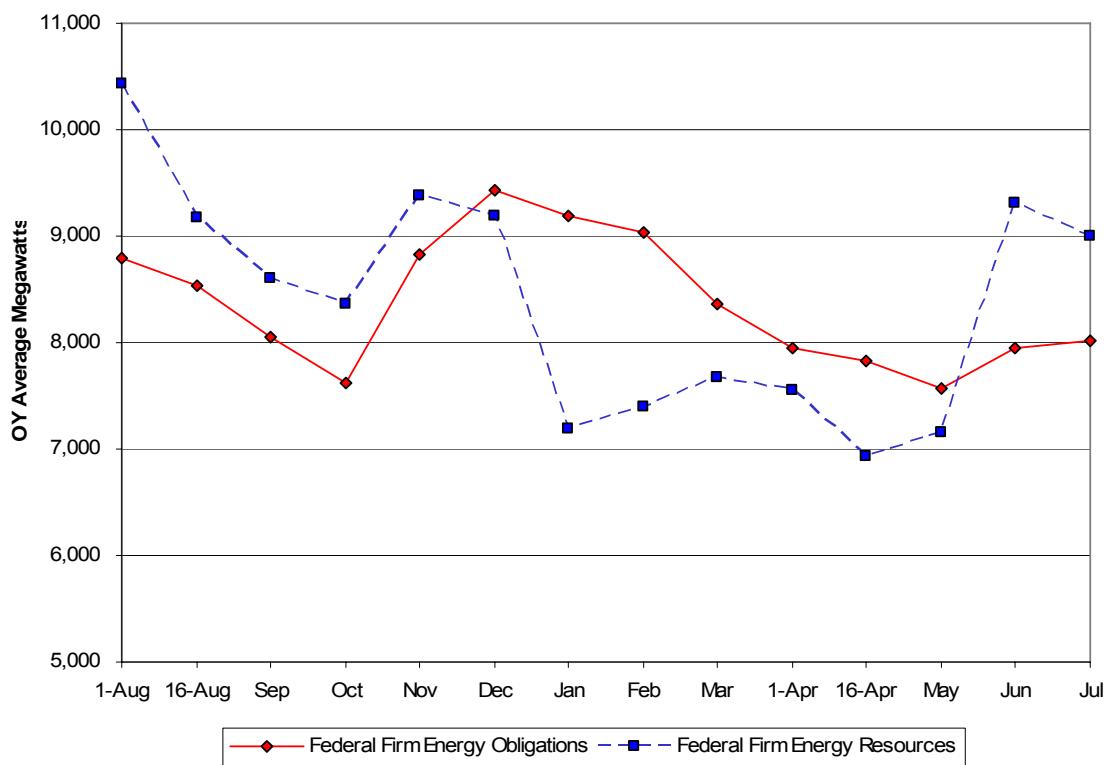

Monthly Federal Firm Energy Surplus/Deficit Projections

To depict the monthly variability of the loads and resources, using the “Federal System Assumptions” detailed on page 17, the monthly Federal system energy components using 1937-critical water conditions for OY 2007, 2011, and 2016 are shown in Exhibits 2 through 4, pages 69-71. Figure 7, below, illustrates the monthly Federal system firm energy loads and resources for OY 2007. This figure shows an example of the monthly timing of Federal system surpluses and deficits using current Biological Opinion flow requirements.

Figure 7

OY 2007 Monthly Federal Firm Energy Loads and Resources Using 1937-Critical Water Conditions

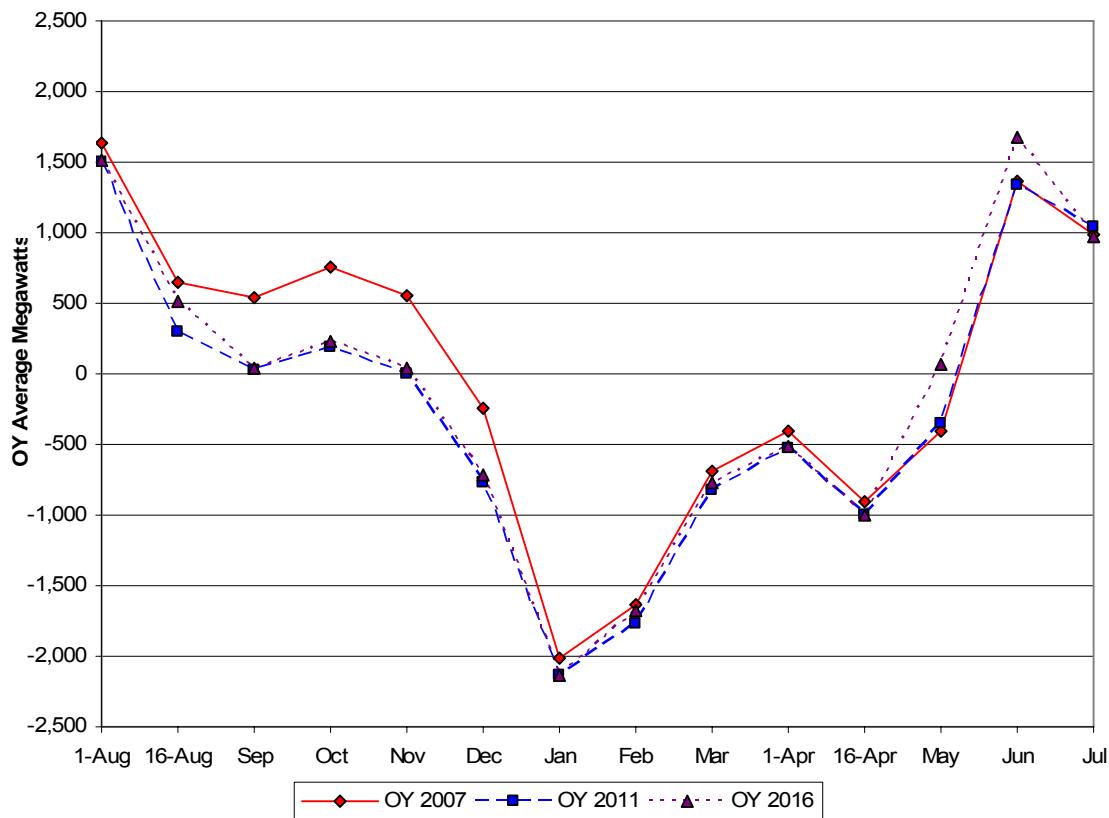

Using critical water conditions, Federal hydro resources are generally operated at lower power production levels during January through March to allow the reservoirs to store water for release in the spring to assist fish passage.

In addition to the monthly variability of the Federal surplus/deficit using critical water conditions, the Federal surplus/deficit can also vary greatly depending on water conditions in the PNW. Exhibits 8 through 17, pages 81-90, illustrate the Federal firm energy surplus/deficit projections using the 50-water years of record.

Figure 8, below, shows the monthly Federal firm energy surplus/deficit projections for OY 2007, 2011, and 2016 incorporating the “Federal System Assumptions” detailed on page 17.

Figure 8

**Monthly Federal Firm Energy Surplus/Deficit Projections
Using 1937-Critical Water Conditions
For OY 2007, 2011, and 2016**

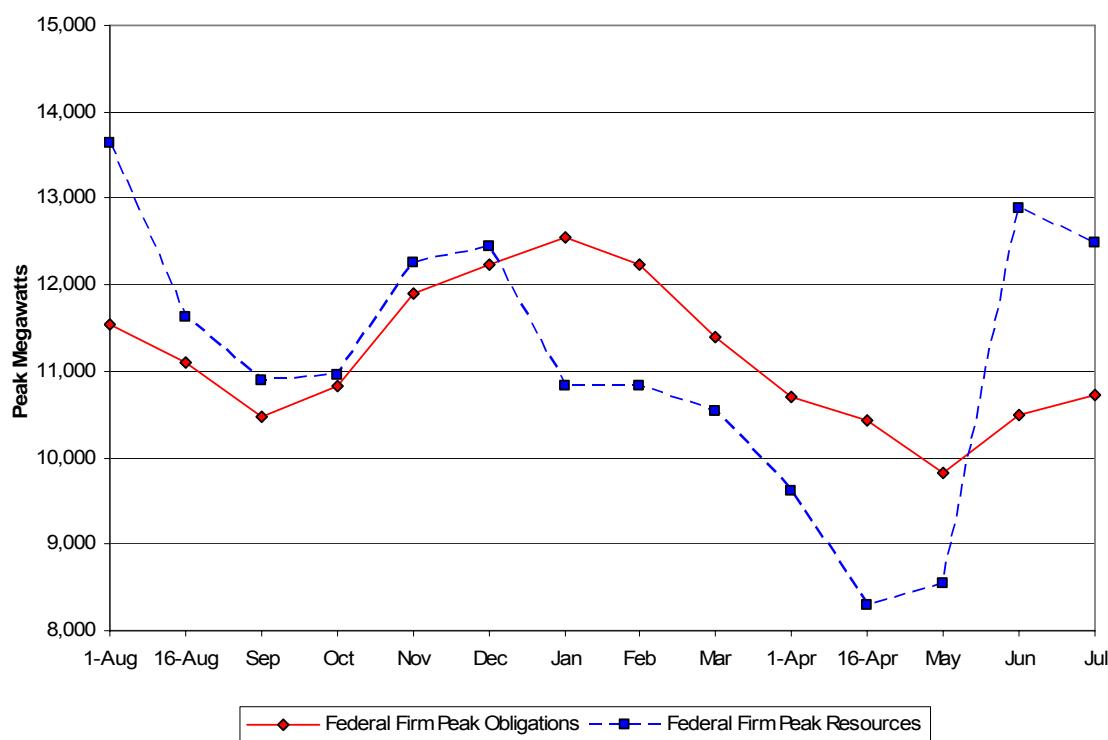

Federal Firm Monthly 1-Hour Capacity Surplus/Deficit Projections

Figure 9, below, illustrates the monthly 1-hour Federal system peak loads and resources for OY 2007 using the “Federal System Assumptions” detailed on page 17. The projections assume 1937-critical water conditions, normal weather conditions, and a 50-percent probability that the actual peak loads will be exceeded. The peak load projections are reduced by a 1-hour diversity component to address the fact that all electrical peak demands do not occur simultaneously throughout the region. In addition, the Federal hydro capacity is reduced by an operational peaking adjustment to estimate the monthly maximum operational capability that is available to meet the 1-hour expected peak load. This figure illustrates an example of how the timing and magnitude of the Federal system capacity surpluses and deficits could potentially occur within any one operating year using 1937-critical water conditions.

Figure 9

OY 2007 Monthly 1-Hour Federal Capacity Loads and Resources Using 1937-Critical Water Conditions

BPA's surplus firm capacity values take into account the following Federal system hydrologic constraints:

- An operational peaking adjustment that reduced the maximum Federal hydro capacity estimate to meet the 1-hour expected peak load in any given month;
- Limitations on moving water between projects, including upstream storage;

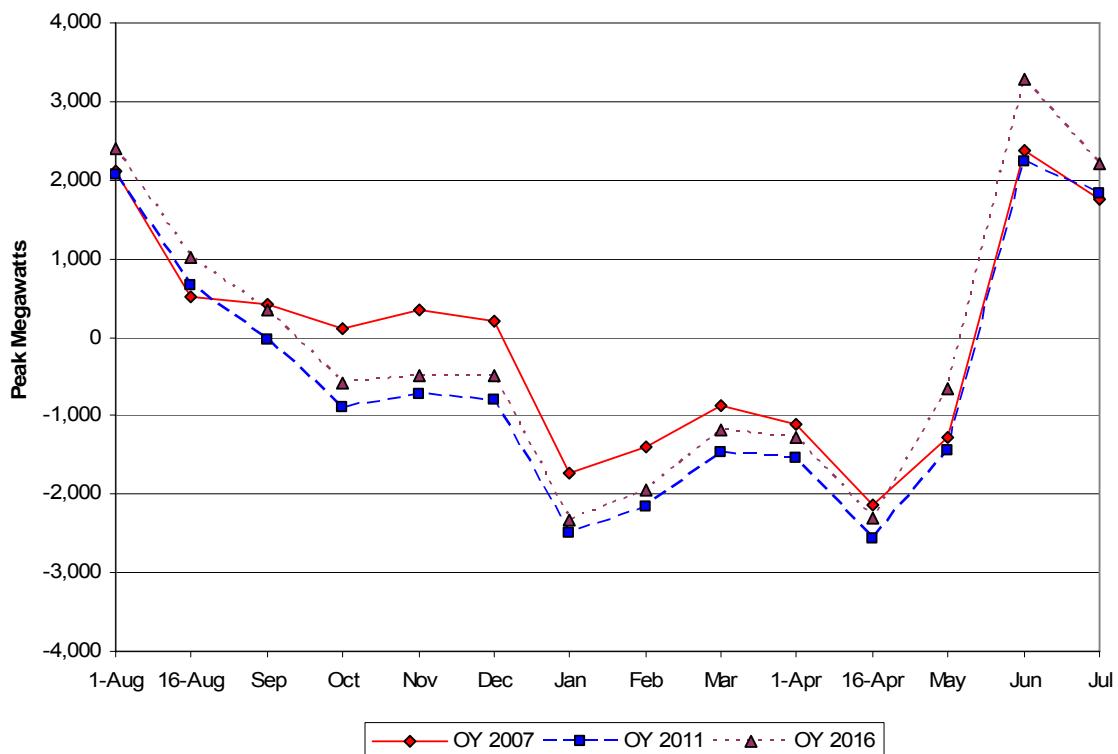

- Pondage limitations due to hydraulic imbalance from reservoir to reservoir;
- Fish and Biological Opinion requirements from the NOAA Fisheries Biological Opinion, dated December 2004, the 2004 Biological Opinion Remand Process and the U.S. Fish and Wildlife Service's 2000 Biological Opinion; and
- Navigation and recreation constraints, including restrictions on the rate of rise or fall of tailwater and forebay elevations.

The Federal operational peaking adjustment will be updated for future studies to incorporate revisions in non-power hydro requirements and changes in BPA contracts.

Figure 10, below, illustrates the 1-hour Federal firm capacity surplus/deficit projections for OY 2007, 2011, and 2016.

Figure 10

**Monthly 1-Hour Federal Capacity Surplus/Deficit Projections
Using 1937-Critical Water Conditions
For OY 2007, 2011, and 2016**

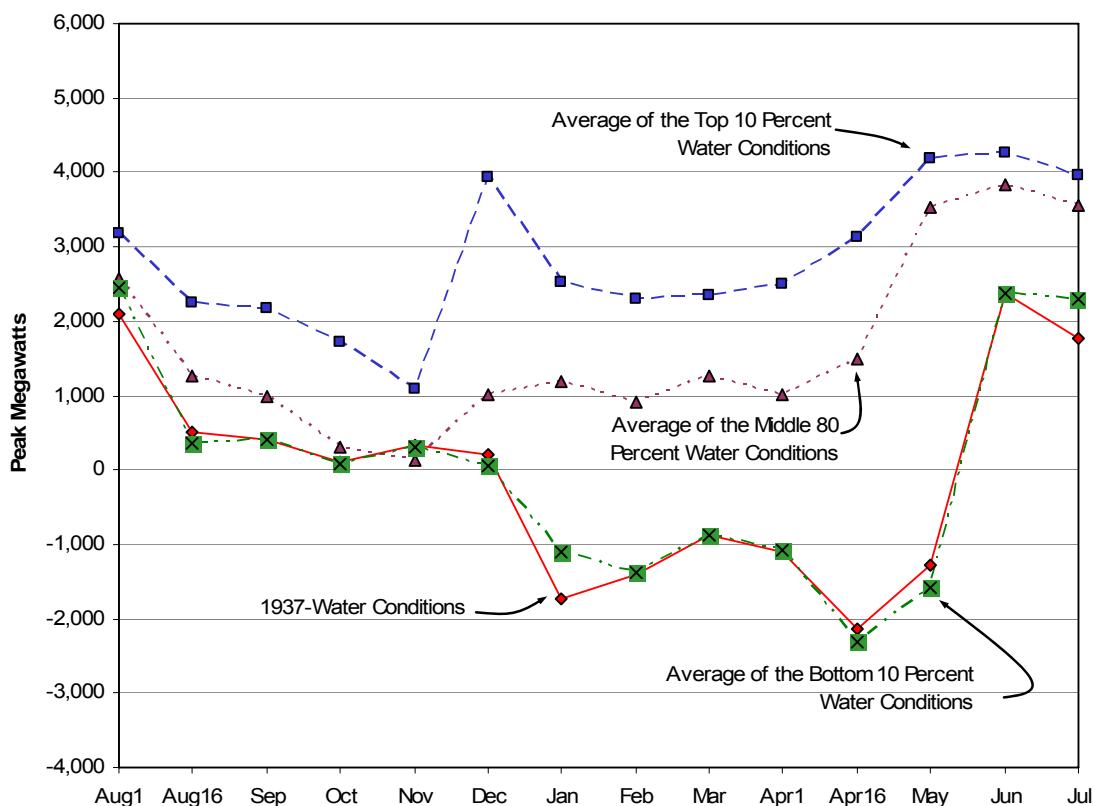

The 1-hour Federal capacity surplus/deficit projections, assuming normal weather conditions and 1937-critical water conditions for OY 2007, 2011, and 2016, are shown in Exhibits 5 through 7, pages 75-77.

Potential Variability of Federal 1-Hour Capacity Surplus/Deficit Projections

To illustrate the potential variability of 1-hour Federal system capacity surplus/deficits, this study compares different scenarios using varying levels of Federal system generation based on water conditions and normal weather loads. Figure 11, below, compares the 1-hour Federal system capacity surplus/deficits for OY 2007 under four scenarios: resources using 1937-critical water conditions (the base case of this study), the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions (1929 through 1978). As the Federal system experiences better water conditions, the availability of 1-hour capacity surpluses increases—especially in the January through May time period.

Figure 11

Potential Variability of 1-Hour Capacity Federal Surplus/Deficit Projections Utilizing Differing Water Conditions For OY 2007

Federal Resource Adequacy

The Federal system energy and capacity load resource projections use the “Federal System Assumptions” presented on page 17 and are considered conservative. This analysis assumes Federal system hydro generation using 1937-critical water conditions, Federal non-hydro resources operating at expected generation levels, and Federal contract obligations, and purchases delivered at maximum contract levels. Federal system deficits will be met by any combination of the following:

- Better than critical water conditions, which increases water flow and water storage thereby increasing the output of the Federal hydro system;
- Power purchases or the acquisition of generation from operating IPP projects;
- Market purchases to cover the delay or termination of long-term resource purchase contracts;
- Cost-effective conservation and load management programs that reduce BPA’s load obligations;
- PSC net requirement load obligation variability due to current and future economic conditions; and
- Purchase of off-system storage and exchange agreements that allow for monthly seasonal shaping of Federal hydropower with other PNW entities or other west coast regions.

As the Federal system contracts for additional power purchases or generation from new or existing resources, those amounts will be incorporated into future studies.

Section 5: Pacific Northwest Regional Analysis

Regional Analysis Assumptions

This regional loads and resources analysis is based on regional loads, resources, and contracts that were finalized as of March 31, 2006. Study assumptions for the regional analysis are as follows:

- Total retail load forecasts reflect normal weather conditions;
- Regulated hydro generation estimates incorporate PNCA plant characteristics, streamflows, and BPA's best estimate of non-power requirements. The estimated output for independent hydro and other generating projects are provided to BPA by the project owners;
- All existing regional import and export contracts expire by the terms of their agreements and are not renewed;
- Federal system power sales and capacity/energy exchange agreements with the cities of Burbank, Glendale, and Pasadena are shown as capacity/energy exchanges until they expire on April 15, 2008;
- Uncommitted PNW IPP generation is included in the regional resource stack and is assumed available to meet regional load unless otherwise specified;
- There is no substantial operational change in non-Federal hydro licensing for regional hydro resources;
- Firm hydro energy and capacity estimates are based on 1937-critical water conditions, unless otherwise specified;
- Federal hydro capacity is reduced by an operational peaking adjustment to better estimate the monthly maximum operational capability available to meet the 1-hour expected peak load, for each of the 1929 through 1978 historical water conditions; and
- Transmission losses are treated as a resource reduction.

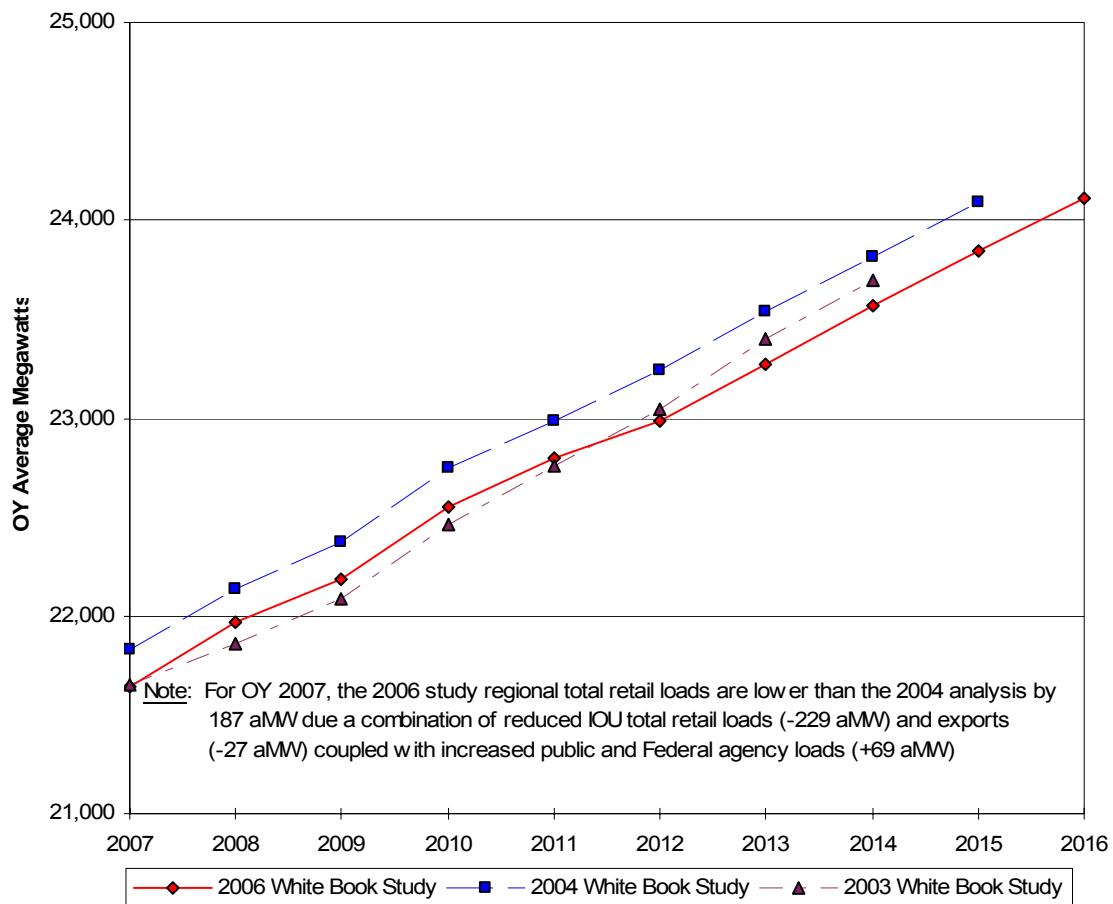

Annual Regional Firm Energy Load Projections

BPA's 2006 White Book annual regional firm energy load projections are comprised of two components:

- Total retail load consumption based on the individual entity's total retail load forecast discussed in "Total Retail Load Forecast", page 3; plus
- Reported long-term and multi-year export contracts made by PNW entities, including BPA.

Figure 12, below, graphically illustrates how the 2006 White Book regional firm energy load projections compare to the previous 2004 and 2003 studies. The differences reflect updates in the regional total retail load forecasts and export contracts for the Federal agencies, public agencies, cooperatives, USBR, IOUs, and DSIs.

Figure 12
Annual Regional Firm Energy Load Projections¹
Including Exports
For OY 2007 through 2016

The PNW region utilized in this study is defined by the Northwest Power Act and is consistent with that used by the Council and PNUCC. For forecasting and reporting purposes, other entities may have different definitions of the PNW region, therefore making direct comparisons incompatible. For example, load forecasts or data provided by the Northwest Power Pool (Power Pool), tends to be much higher than those presented here due to the use of a larger PNW regional area. In addition to the load area defined by the Northwest Power Act, the Power Pool PNW region includes loads from Sierra Pacific Power and British Columbia and Alberta, Canada.

¹ 2004 White Book projections were published through OY 2015. 2003 White Book projections were published through OY 2014.

Table 9, below, compares the relative size of regional firm loads by customer class for OY 2007.

Table 9
Annual Regional Firm Energy Load
by Customer Class
For OY 2007

Customer Class	Firm Energy (OY in aMW)	Firm Energy (Percent of Total)
Investor-Owned Entities	10,966	50.7%
Public Entities	8,598	39.7%
Exports	1,002	4.6%
Direct Service Industries	473	2.2%
Federal and Other Entities	601	2.8%
Total Regional Firm Load	21,640	100.0%

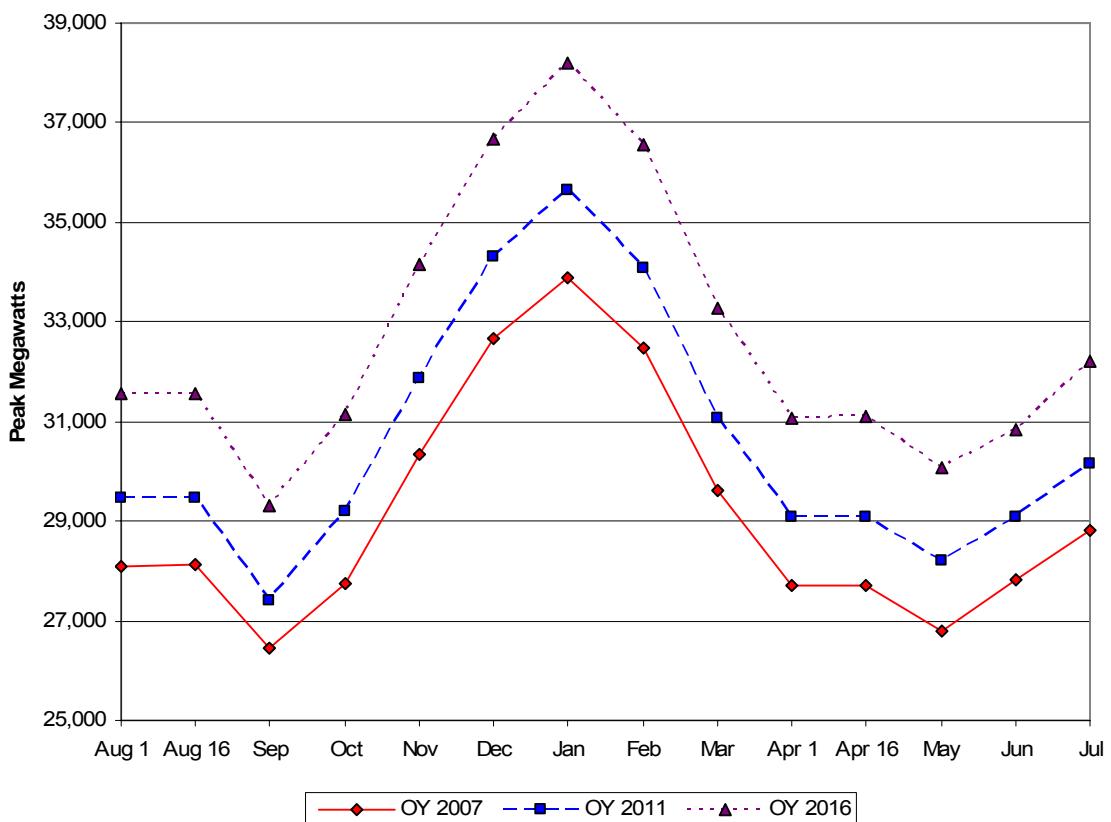

The annual regional firm energy loads are presented in Exhibit 18, page 95, and monthly firm energy loads for OY 2007, 2011, and 2016 are presented in Exhibits 19 through 21, pages 99-101.

Monthly Regional Firm Peak Load Projections

BPA's 2006 White Book total retail load peaks are based on the individual entity forecasts of expected 1-hour monthly peak demand. The peak load estimates are based on normal weather conditions using a 50-percent probability that the forecasted peak load will be exceeded. In addition, the projected regional peak loads include export contracts made by PNW utilities, including those in the Federal system. The peak load projections are reduced by a 1-hour diversity component to address the fact that all electrical peak demands do not occur simultaneously throughout the region.

Figure 13, below, illustrates the monthly regional 1-hour firm peak loads for OY 2007, 2011, and 2016.

Figure 13
Monthly Regional Firm 1-Hour Peak Load Projections
For OY 2007, 2011, and 2016

The monthly regional firm 1-hour peak loads are presented in Exhibits 22 through 24, pages 105-107.

Regional Firm Resources

Hydro resources represent a smaller share of the total regional resource stack than that of the Federal system. This is because regional entities own the majority of non-hydro resources such as thermal resources, which are primarily comprised of coal, gas, and oil-fired projects and ENW's Columbia Generating Station nuclear plant. New generating projects are included when they have been placed into operation or are in the actual construction process. The projects are detailed in "Changes in the 2006 Pacific Northwest Loads and Resources Study", page 13.

Table 10, below, summarizes the PNW regional resource capacity and energy by generation type for OY 2007.

Table 10

Total Regional Firm Resources for OY 2007¹
Based on 1937-Critical Water Conditions

Project Type	1-Hour Operational Peaking Capacity (January Peak MW)	Percent of Operational Peaking Capacity	Firm Energy (OY in aMW)	Percent of Firm Energy
Hydro	23,922 ²	60.0%	11,698	48.0%
Coal	5,903	14.9%	4,997	20.5%
Combustion Turbines	3,761	9.4%	2,254	9.3%
Cogeneration	2,248	5.6%	1,984	8.1%
Imports	1,630	4.1%	1,089	4.5%
Nuclear	1,150	2.9%	877	3.6%
Non-Utility Generation	1,130	2.8%	1,387	5.7%
Miscellaneous	131	0.3%	80	0.3%
Total Firm Resources	39,875	100.0%	24,366	100.0%

¹ Regional firm resource estimates before adjustments for reserves, maintenance, and transmission losses.

² The hydroelectric capacity is reduced by an operational peaking adjustment, to estimate the monthly maximum operational capability that is available to meet the 1-hour expected peak load, for 1937-critical water conditions. For January 2007, the reduction is -8,659 peak MW.

Potential Variability of Regional Resources

To illustrate the potential variability of regional resources, this study compares different scenarios using varying levels of regional hydro generation based on water conditions. Table 11, below, compares the expected annual regional resources under four scenarios using 1937-critical water conditions as the base case and the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions (1929 through 1978). For OY 2007, regional resource estimates can potentially vary up to 6,250 aMW, ranging from approximately 23,650 to 29,920 aMW, due to possible hydro variability.

Table 11

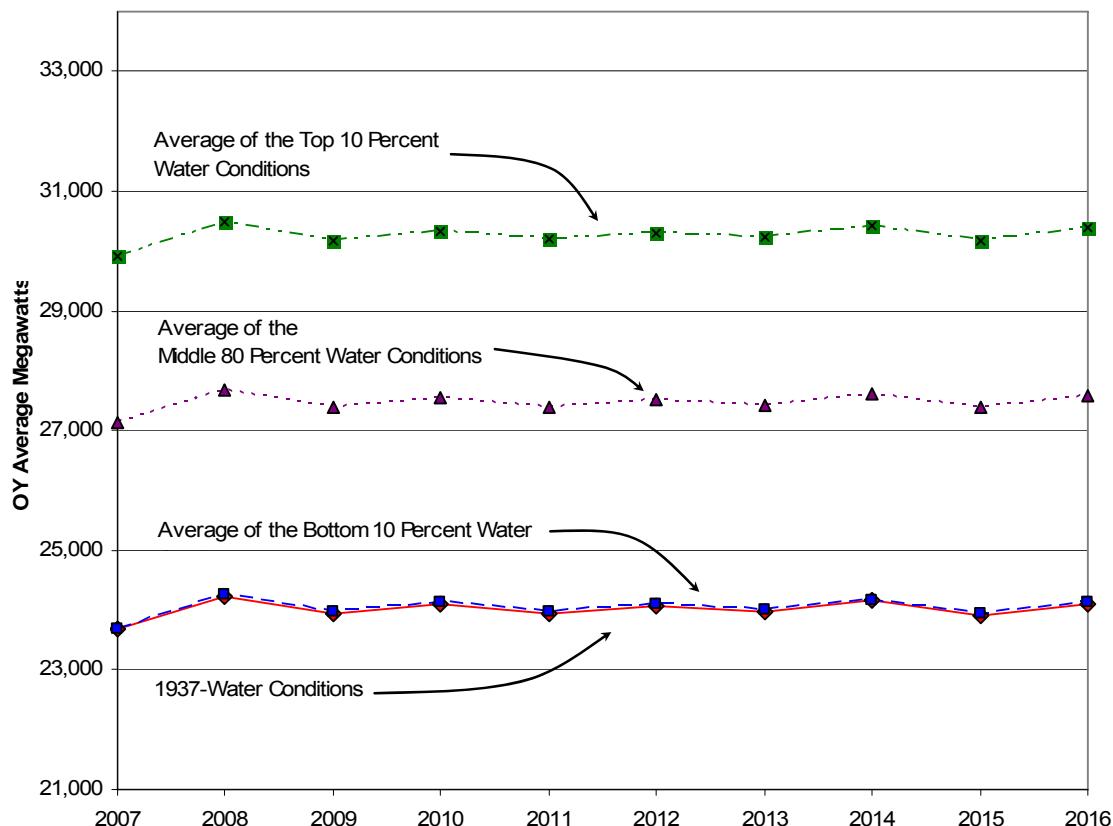

Potential Variability of Total Regional Net Resource Projections¹
Utilizing Different Levels of Water Conditions
Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
1937-Critical Water Conditions	23,667	24,229	23,943	24,096	23,952	24,067	23,967	24,154	23,917	24,114

Potential Variability of Total Regional Net Resource Projections¹
Utilizing Different Levels of Water Conditions

¹ Total regional net resource estimates include adjustments for reserves, maintenance, and transmission losses.

Annual Regional Firm Energy Surplus/Deficit Projections

The annual regional firm energy surplus/deficit projections for OY 2007 through 2016, assuming 1937-critical water conditions, are presented below in Table 12. These projections incorporate the “Regional Analysis Assumptions” presented on page 35. The PNW regional resource stack assumption is that all regional IPP generation is available to the region. The region is expected to be in firm energy surplus through OY 2016 with surpluses ranging from 2,028 aMW in OY 2007, declining to 5 aMW by OY 2016. The changes in the regional energy surplus/deficit levels are mainly due to revisions to regional load forecasts, new generating resources, as well as changes in the timing of the completion of new generating resources.

Table 12

**Regional Firm Energy Surplus/Deficit Projections
Using 1937-Critical Water Conditions
Energy in Average Megawatts**

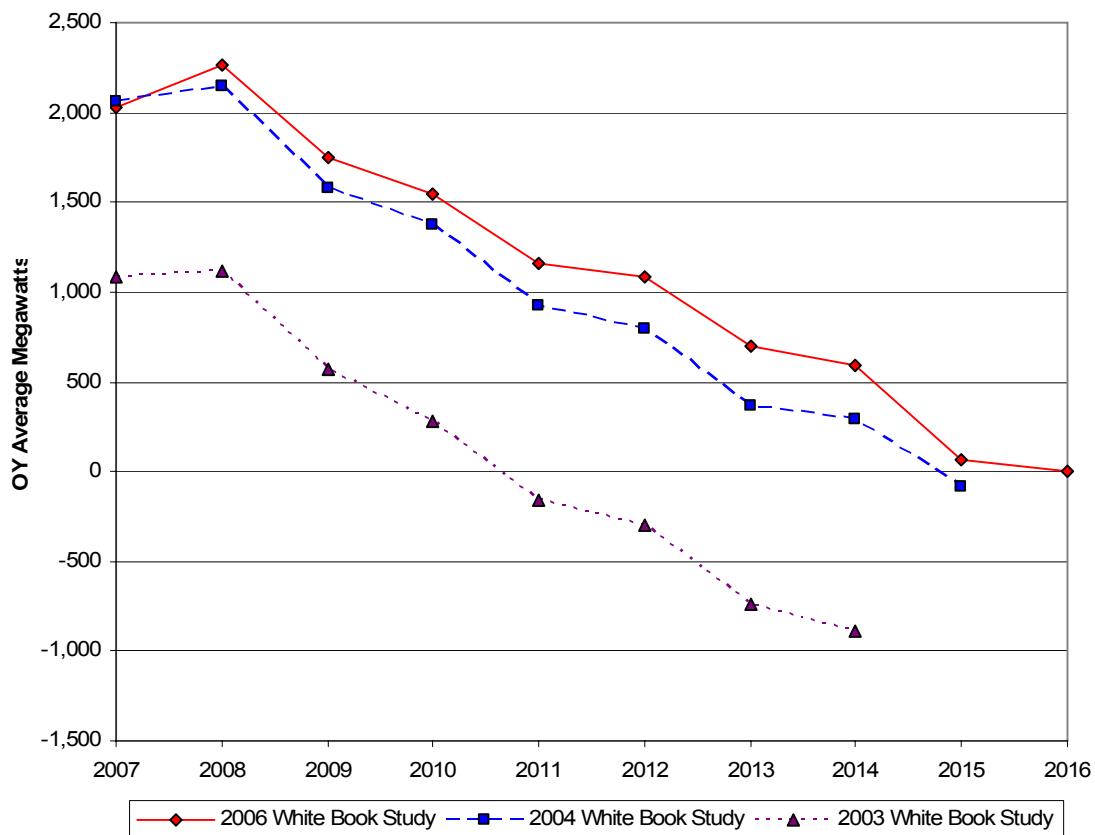

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Regional Surplus/Deficit	2,028	2,262	1,753	1,542	1,156	1,081	697	590	70	5

The Council has recently adopted a regional energy adequacy standard and a pilot capacity standard. BPA is currently working with the Council and other regional parties to develop guidelines for applying these regional standards to individual entities, such as BPA, for future application for regional planning.

Figure 15, below, graphically illustrates how the 2006 White Book regional energy surpluses/deficits compares to the previous 2004 and 2003 studies. The 2007 study shows larger regional energy surpluses—especially when compared to the 2003 study—mainly due to the addition of IPP generation within the PNW.

Figure 15

Annual Regional Firm Energy Surplus/Deficit Projections¹
Using 1937-Critical Water Conditions
For OY 2007 through 2016

Components that make up the regional energy surpluses/deficits for OY 2007 through 2016 are presented in Exhibit 18, page 95. Monthly firm energy loads and resources balances for OY 2007, 2011, and 2016 are presented in Exhibits 19 through 21, pages 99-101. In addition to the monthly variability of the regional energy surplus/deficit, the region's surplus/deficit can vary greatly depending on water conditions in the PNW. Exhibits 25 through 34, pages 111-120, contain the regional firm energy surplus/deficit projections under the 50-water years of record (OYs 1929 through 1978).

¹ 2004 White Book projections were published through OY 2015. 2003 White Book projections were published through OY 2014.

Potential Variability of Annual Regional Energy Surplus/Deficit Projections

Potential Variability Due to Water Conditions: To show the potential variability of regional surplus/deficits, this study compares the surplus/deficits under four different levels of regional generation based on different levels of water conditions by using the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions. These projections incorporate the “Regional Analysis Assumptions” presented on page 35. Table 13, below, presents the range of estimated regional surplus/deficits assuming the four differing levels of regional hydro generation. For OY 2007, regional surplus/deficit estimates can potentially vary up to 6,250 aMW, annually ranging from approximately 2,000 to 8,300 aMW, due to possible hydro variability.

Table 13

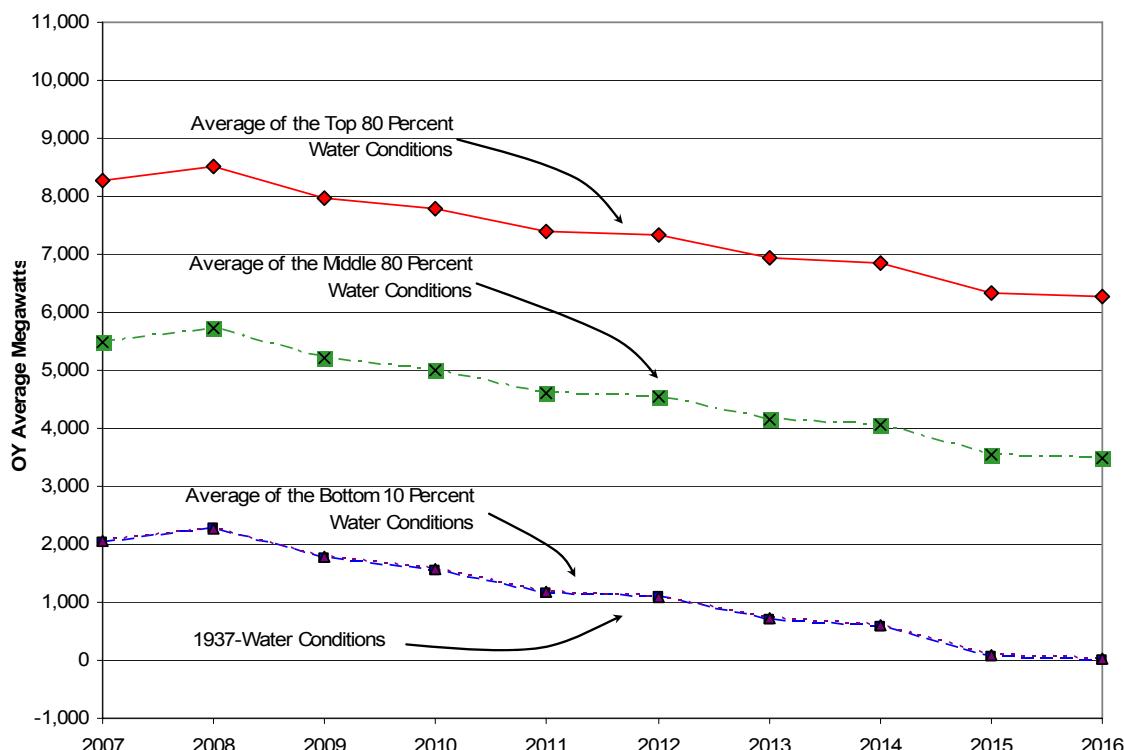

**Potential Variability of Annual Regional Firm Energy Surplus/Deficit
Based on Different Levels of Water Conditions
Energy in Average Megawatts**

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
1937-Critical Water Conditions	2,028	2,262	1,753	1,542	1,156	1,081	697	590	70	5

Average Middle 80% Water Conditions	5,487	5,724	5,198	4,991	4,607	4,533	4,153	4,050	3,534	3,472
Average Top 10% Water Conditions	8,284	8,522	7,983	7,780	7,398	7,324	6,947	6,847	6,332	6,273

Figure 16, below, illustrates the range of estimated regional surplus/deficits assuming differing levels of regional hydro generation discussed above.

Figure 16

**Variability of Annual Regional Firm Energy Surplus/Deficit
Based on Different Levels of Water Conditions
For OY 2007 through 2016**

Potential Variability Due to IPP Generation Amounts Delivered to the Region:

This study assumes approximately 3,360 aMW of uncommitted PNW IPP generation as regional resources though potentially these resources may not be available when needed to serve PNW regional loads. Table 14, page 46, details the peak annual energy of expected regional uncommitted IPP projects. The 2004 White Book showed about 3,110 aMW of IPP generation. This change is mostly due to updates in the timing of IPP project completions and/or new PNW regional acquisition of IPP generation. While this assumption is reasonable from an electrical reliability standpoint, resulting regional surpluses may underestimate the potential for price volatility and overstate the availability of IPP generation for use within the PNW. The PNW region may have to compete with other western markets to secure uncommitted IPP generation to meet electricity demand.

Table 14
Expected PNW Uncommitted IPP Projects
For OY 2007
As of March 31, 2006

Project	Peak (MW)	Energy (aMW)
Big Hannaford	248	224
Centralia #1	670	626
Centralia #2	670	511
Chehalis Generating Facility CCCT	520	417
Emmett Biomass Project	18	10
Goldendale Energy Center	248	224
Hermiston Power Project	469	568
Klamath Cogeneration Project	484	436
Klamath Peaking Unit	100	14
Lancaster Power Project (Rathdrum)	270	244
Metro Westpoint	1.2	1.2
SP Newsprint Cogeneration	40	25
Total Uncommitted IPP Generation	3,738	3,366

Table 15, below, shows the potential variability of the PNW region annual firm energy surplus/deficits by assuming four differing levels of IPP generation delivered to the region—25 percent (840 aMW), 50 percent (1,680 aMW), 75 percent (2,520 aMW), and 100 percent (3,366 aMW). For OY 2007, regional surplus/deficit estimates can potentially vary up to 2,500 aMW, annually ranging from an approximate 2,000 aMW surplus to approximately -500 aMW deficit, due to differing possible IPP generation commitments to the PNW.

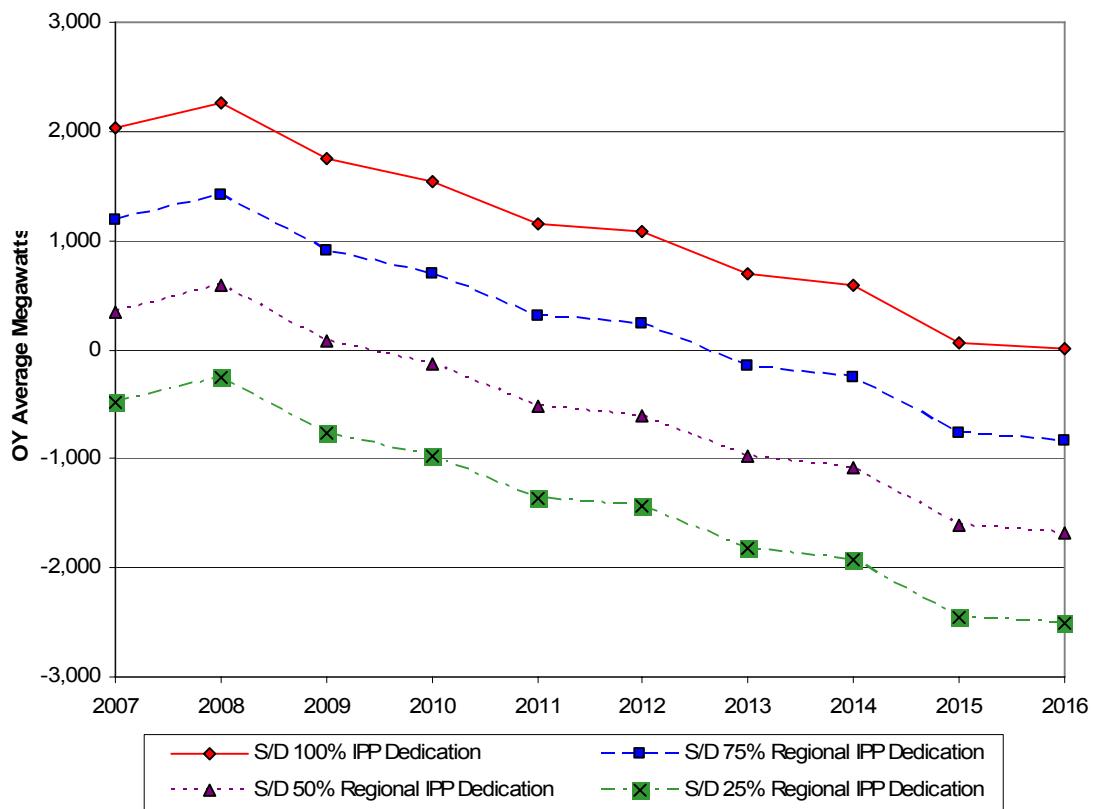

Table 15
Potential Variability of PNW Region Annual Firm Energy Surplus/Deficit
Based on Different Levels of IPP Generation Delivered to the Region
Using 1937-Critical Water Conditions
Energy in Average Megawatts

Operating Year	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
S/D 100% IPP PNW Delivered (3,366 aMW)	2,028	2,262	1,753	1,542	1,156	1,081	697	590	70	5
S/D 75% IPP PNW Delivered (2,520 aMW)	1,188	1,422	913	702	316	241	-143	-250	-770	-835
S/D 50% IPP PNW Delivered (1,680 aMW)	348	582	73	-138	-524	-599	-983	-1,090	-1,610	-1,675
S/D 25% IPP PNW Delivered (840 aMW)	-492	-258	-767	-978	-1,364	-1,439	-1,823	-1,930	-2,450	-2,515

Figure 17, below, graphically illustrates the potential variability of regional surplus/deficits by assuming the above mentioned four differing levels of IPP generation delivered to the region—25 percent, 50 percent, 75 percent, and 100 percent.

Figure 17

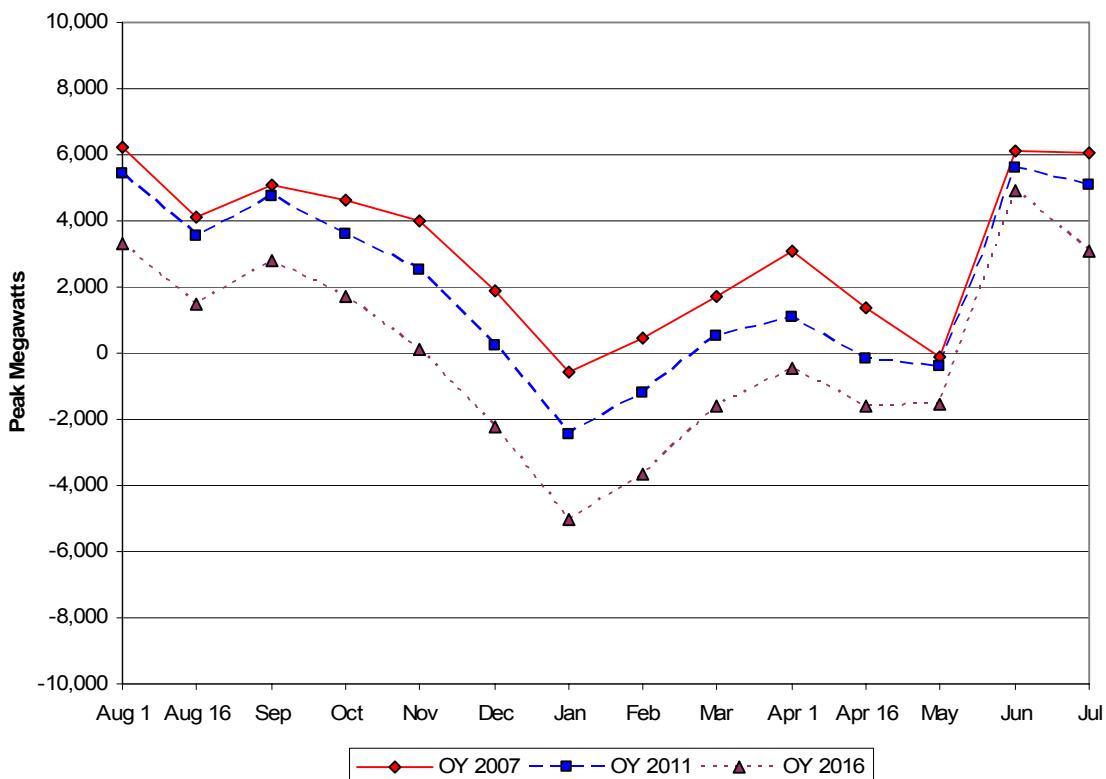

**Potential Variability of Annual Regional Firm Energy Surplus/Deficit
Based on Different Levels of IPP Generation Delivered to the Region
Using 1937-Critical Water Conditions**

Monthly Regional Firm 1-Hour Capacity Surplus/Deficit Projections

Figure 18, below, graphically illustrates the monthly regional 1-hour capacity surplus/deficit projections for OY 2007, 2011, and 2016 and incorporates the “Regional Analysis Assumptions” on page 35. The projections assume 1937-critical water conditions, normal weather conditions, and a 50-percent probability that the actual peak loads will be exceeded. The peak load projections were also reduced by a 1-hour diversity component to address the fact that all electrical peak demands do not occur simultaneously throughout the region. The study assumes approximately 3,740 peak MW of uncommitted PNW IPP generation as regional resources though potentially these resource may not be available when needed to serve PNW regional loads. (See Table 14, “Expected PNW Uncommitted IPP Projects” page 46.) In addition, the hydro instantaneous capacity is reduced by a 1-hour operational peaking adjustment to better estimate the monthly maximum operational capability that is available to meet the 1-hour expected peak load. See Section 2, “Hydro 1-Hour Operational Capacity”, page 5. Regional surplus firm capacity values take into account hydrologic constraints detailed in the Section 4, “Federal Firm Monthly 1-Hour Capacity Surplus/Deficit Projections”, page 31.

Figure 18
Monthly Regional Firm 1-Hour Capacity Surplus/Deficit Projections
Using 1937-Critical Water Conditions
For OY 2007, 2011, and 2016

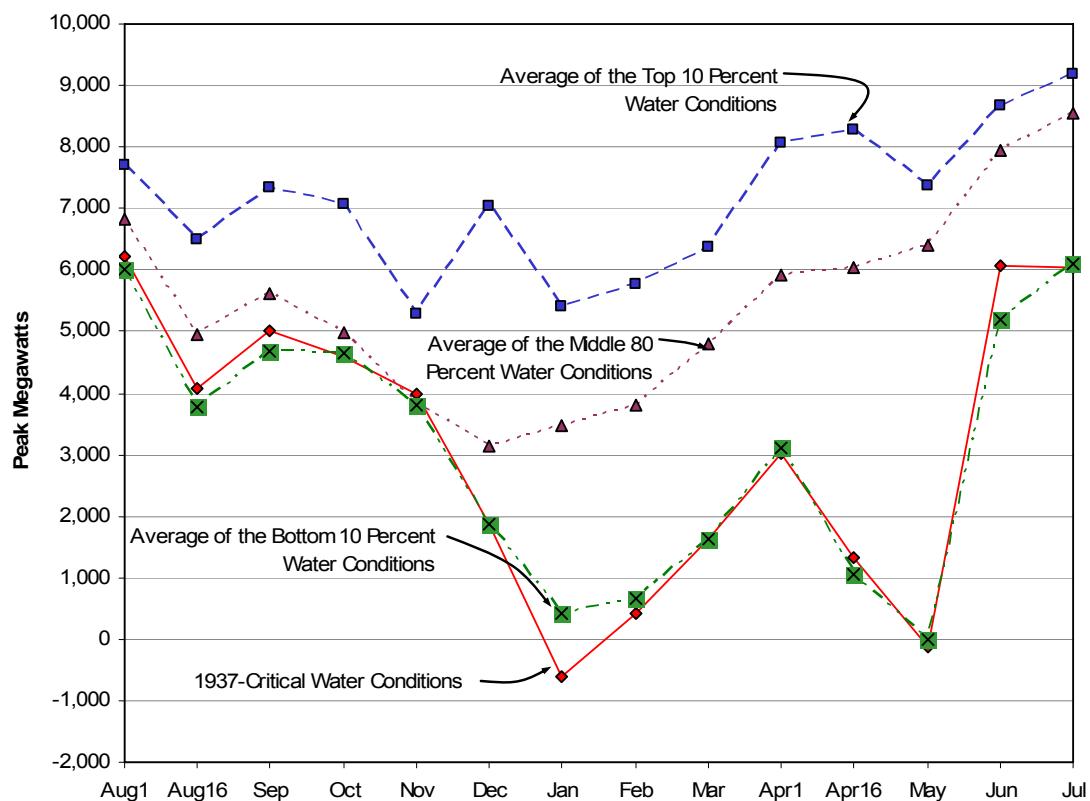

Regional 1-hour capacity surplus/deficit projections, assuming normal weather conditions and 1937-critical water conditions for OY 2007, 2011, and 2016, are shown in Exhibits 22 through 24, pages 105-107.

Potential Variability of PNW Region 1-Hour Capacity Surplus/Deficit Projections

To illustrate the potential variability of 1-hour PNW region capacity surplus/deficits, this study compares different scenarios using varying levels of regional generation based on water conditions and normal weather loads. Figure 19, below, compares the 1-hour regional system capacity surplus/deficits under four scenarios: resources using 1937-critical water conditions (the base case of this study), the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions (1929 through 1978). As the region experiences better water conditions, the availability of 1-hour capacity surpluses increases—especially in the December through May time period.

Figure 19

Potential Variability of 1-Hour Capacity PNW Regional Surplus/Deficit Projections Utilizing Differing Water Conditions For OY 2007

Regional Resource Adequacy

The regional energy and capacity load resource projections use the “Regional Analysis Assumptions” presented on page 35 and are considered conservative with the exception of the treatment of IPP resources. This analysis assumes regional hydro generation using 1937-critical water conditions, non-hydro resources operating at expected generation levels, and contract obligations and purchases delivered at maximum contract levels. IPP plants are assumed to be available to meet regional loads unless otherwise contracted. However, the resulting regional surpluses may underestimate the potential for price volatility because the PNW region may have to compete with other western markets to secure these sources of supply. Regional deficits will be met by any combination of the following:

- Better than critical water conditions, which increases water flow and water storage thereby increasing the output of the regional hydro system;
- Power purchases or the acquisition of generation from additional operating IPP projects;
- Cost-effective conservation and load management programs that reduce total retail loads;
- Total retail load variability due to current and future economic conditions;
- DSI long-term load levels are forecasted to reach 608 aMW throughout the study. Actual DSI load levels could be different, based on electricity prices, aluminum commodity prices, and closures; and
- Purchase of off-system storage and exchange agreements with other regions that allow for monthly seasonal shaping of regional hydropower.

As the region executes new contracts for additional power purchases or generation from new or existing resources, those amounts will be included in future analyses. In addition, the PNW is currently developing Resource Adequacy standards to answer the question of how to properly account for the capacity and energy for the region. These types of changes would most likely be presented in future studies.

Section 6: Northwest Power and Conservation Council Comparison

Non-DSI Regional Load Comparison: 2006 White Book to Council

The following compares the non-DSI regional firm total retail loads between BPA's 2006 White Book and the Northwest Power and Conservation Council's Final Fifth Northwest Electric Power and Conservation Plan (May 2005). To provide consistency for this comparison, the regional DSI load component was removed from both forecasts. It should be noted that the regional total retail loads do not include regional exports, which are a separate component of load obligations to the PNW region.

2006 White Book Non-DSI Total Retail Load Forecast: The 2006 White Book total retail load projections were initially estimated separately, for each individual entity and then grouped into the following categories: Federal agencies, public agencies, cooperatives, USBR, and IOUs. The total retail load forecasts were finalized on March 31, 2006.

The total retail load forecasts for the Federal agencies, public agencies, cooperatives, and USBR were developed using any combination of the following:

- Linear trending based on historical power consumption;
- Data obtained from the individual entity's 2001 power sales contracts' Exhibit C submittals; and
- Retail load forecasts sent directly to BPA through their PNUCC submittals.

The load forecasts for the IOUs were developed from both data submitted in their PNUCC submittals and load forecasts sent directly to BPA. Generally, the load estimates are slightly lower when compared to last year's.

Council Non-DSI Total Retail Load Forecast: The Council's final Fifth Northwest Electric Power and Conservation Plan (May 2005) assumes that non-DSI electricity demand is recovering from the economic recession of early 2000, but that demand is still lower than the Fourth Power Plan forecast. The expected lower level of demand is partially due to permanent effects of higher electricity prices which are assumed to dampen the effects of the economic recovery, as well as, due to lasting efficiency improvements achieved during the electricity crisis the region experienced during late 2000 and 2001.

Comparison of the Non-DSI Total Retail Load Forecast: The differences between the Council and 2006 White Book non-DSI load forecasts average -1.6 percent over the 10 years of the study. The maximum difference expected is -1.9 percent (-437 aMW) in OY 2016. The difference is considered minor and is mainly due to variations in modeling methods and the vintage of data used in the two forecasts.

Table 15, below, compares the non-DSI regional firm total retail loads between BPA's 2006 White Book and the Council's Fifth Northwest Electric Power and Conservation Plan (May 2005).

Figure 20
Comparison of Non-DSI Regional Firm Total Retail Loads
BPA 2006 White Book Load Projections and the
Council's Fifth Northwest Electric Power and Conservation Plan (May 2005)

Comparison of Resource Stack Assumptions: 2006 White Book to Council

A comparison of the resource assumptions between the 2006 White Book and the Council's Fifth Northwest Electric Power and Conservation Plan is listed below.

2006 White Book Resource Stack Assumptions: The 2006 White Book resource stack assumptions were estimated on a unit basis. Revisions to current thermal plant operations are based on submittals by utilities either to the PNUCC or data submitted directly to BPA for the purpose of this study. Resources listed in this study represent plants that have been placed into operation or are currently in the construction process. The capacity and energy values have been estimated through information provided by PNUCC or through conversations with the plant managers.

Council Resource Stack Assumptions: The Council's near-term regional resource stack assumptions for its wholesale power price forecast are based on projects under construction, similar to the process utilized by BPA. The treatment of new resources by the Council and BPA differ in the following manner: 1) BPA adds plants to the resources based on the operator's/developer's best estimate of completion; and 2) the Council estimates operation dates for new resources based on economic competitiveness as estimated by the AURORA™ Electric Market Model. Therefore, the Council may delay an announced operational date of a future plant based on the perceived need for the plant as determined by their model.

Comparison of the Resource Stack: The following compares the different assumptions used for BPA's 2006 White Book and the Council's estimation in constructing their new resource stack.

- BPA includes only Pennsylvania Power & Light Company's (PP&L Montana) resources that are dedicated to serve Northwestern Energy's (formally Montana Power Company) eastern Montana loads. The Council includes most of PPL Montana's generation in their regional resource stack, regardless of whether they are dedicated to serve PNW regional loads. BPA will review the status of these resources in future studies.
- The Council includes the nameplate rating of the following self-generating units: BP Cherry Point, Georgia Pacific Bellingham, Sierra Pine Medite, and Wah Chang. In addition, the Council includes the reactivated Frontier Energy project. BPA does not include these plants and will review these plants for possible inclusion in future studies.
- In addition, BPA and the Council treat the wind projects differently. At this time, BPA only recognizes the average energy generation projection for wind projects and does not recognize a peaking capacity credit for wind projects to be able to predictably meet peaking loads. The Council models wind projects as predictable, shaped energy resources and credits wind with a capacity equivalent to the installed wind capacity times a capacity factor.

These resource stack differences are generally based on the timing and treatment of new regional resources. They are considered minor in long-range load resource planning.

Section 7: Potential Federal System 120-Hour Capacity Planning for the Future

The installed capacity at Federal projects is greater than the available fuel supply (water), particularly in low water scenarios. The over-installed hydro capability coupled with historic flexibility in hydro operation traditionally made capacity considerations a lower concern within the region for studies. Because of these factors, planning for the FCRPS has historically been focused on providing sufficient hydro energy over time rather than meeting capacity or sustained capacity needs.

BPA's objective is to provide the best value for customers and constituents with the finite capabilities of the FCRPS. In order to achieve this, there needs to be a common understanding of the challenges and opportunities to provide different capacity services to and define the choices available to the region with regard to system capacity.

BPA recently updated its Federal system hydro 1-hour operational peaking adjustment and is presently in the process of investigating additional methods of estimating capacity, duration of capacity, and how to properly account for capacity within the interconnected hydro system due to:

- Changes in complex power and non-power requirements specifying flows that limit ramping, peaking, and storage capability--effectively de-rating hydro system capacity;
- Increasing demands for re-dispatch capability due to electricity deregulation and heavy use of the transmission system grid;
- Increasing needs for integration services for non-dispatchable intermittent resources, such as wind, that can result in reduced hydro flexibility to serve firm load; and
- Increased regulatory and customer interest to understand capacity, its uses, and capacity availability in the PNW. This is due to the development of resource adequacy standards, nationally and within the region, the Regional Dialogue process and the application of the Slice product.

BPA has capacity planning tools that feed into the White Book, short-term planning operations, and reliability. The planned availability of fuel, as well as the duration of use of the planned energy or capacity, is situational. For that reason, BPA uses the following multiple tools to assist in its evaluation of capacity.

- White Book Capacity Planning: Current White Book estimates an Operational Peaking Capacity. Using Federal system hydro energy to capacity relationships developed by HOSS, the Operational Peaking Capacity estimates the 1-hour maximum generation that meets a typical hourly load shape for any given month. This method does not borrow water from future months, rather maximizes HLH hydro system generation using HLH and LLH marketing and within month hydro flexibility.
- Short-Term Operations Capacity Planning: BPA short-term operation planning uses a 120-hour peak to estimate capacity availability for the short-term. The 120-hour peak generation estimates the average of the top 6 hours of HLH

Federal generation over weekdays in any given month using the HOSS model. This method does not borrow water from future months, rather maximizes HLH hydro system generation using HLH and LLH marketing and within month hydro flexibility. The 120-hours are associated with the following:

- 6 hours/day*5 days/week*4 weeks/month (6*5*4=120).
- Capacity Reliability and Adequacy Planning: Capacity availability for reliability and adequacy is different than planning for short- and long-term capacity needs. Reliability and adequacy planning is to maintain a stable electric system when it is stressed, such as during an extreme weather event or loss of a large resource. In order to maintain system stability, reliability methods may borrow water from future months, violate normal non-power requirements when appropriate, and make significant purchases to assure an adequate supply of power. BPA, the Council, and other regional parties are currently developing regional reliability and adequacy standards. The Council recently adopted a regional energy adequacy standard and a pilot capacity adequacy standard. BPA will continue to work with the Council and regional parties to further test and develop a capacity reliability and adequacy standard. Currently, BPA's short- and long-term power planning inventory does not use these same capacity reliability and adequacy measures because it would not be prudent to operate under these measures on a month-by-month continuous basis. Short- and long-term planning typically uses normal weather conditions and does not borrow water from future months. BPA will continue to analyze the role of reliability and adequacy standards for BPA planning.

Federal System 120-Hour Capacity Analysis: While this process is still under way, this is an example of how the Federal firm 120-hour peak capacity surplus/deficit could be utilized for BPA's long-range planning. BPA's instantaneous peak loads are reduced by a 120-hour diversity factor. BPA's resource capabilities are reduced using a 120-hour operational peaking adjustment. The following details the methods used in this process.

- BPA 120-Hour Load Obligation Estimates: BPA's load consist of its PSCs, and other contract obligations not defined under BPA's PSCs, such as contract sales to utilities, marketers and power commitments under international treaty. Of these load obligations, only the PSCs have wide variation between their non-coincidental and coincidental components, thus requiring a diversity factor to reduce the non-coincidental peak to coincide with the time of BPA's system peak. The White Book analysis typically shows non-coincidental expected capacity loads reduced by a 1-hour peak diversity factor. The diversity factor adjusts loads by a "time of day" factor for the month to reduce non-coincidental peak loads to coincide with BPA's system peak. For each month, the sum of BPA's non-coincidental PSC maximum deliveries was compared to the sum of BPA's coincidental peak deliveries at the time of BPA's system peak for the average of the top 120-hours. The 5-year average of these monthly coincidental to non-coincidental ratios comprises the diversity factors. The use of actual hourly PSC sales allows for the development of both the 1-hour and 120-hour diversity factors. Additional hourly diversity factors can be developed using this methodology.
- BPA 120-Hour Generation Estimates: BPA markets power from generating resources that include specific Federal and non-Federal hydro projects, contracted generating projects, BPA hydro-related contracts, and BPA contract

purchases. The output of these projects along with contract purchases comprise BPA's generating resource stack. The Federal system maximum generating capabilities for non-hydro projects in the White Book are estimated for each project assuming 100 percent availability and reflect project maintenance schedules. The Federal system maximum hydro generating capabilities are estimated using mid-month reservoir elevations and are not specifically reduced for hydro maintenance. Due to the fact that Federal system hydro has more machine capability than available fuel (water)--especially under low water conditions--only the hydro portion of the system capability is reduced to reflect a 120-hour capacity availability. This 120-hour reduction is shown as an operation peaking adjustment similar to the 1-hour operation peaking adjustment in this study. The methodology for calculating the 1-hour and 120-hour operational peaking reduction is presented below:

- 120-Hour Operational Peaking Reduction: The 120-hour operational peaking reduction represents a reduction to the Federal system hydro resources to estimate the peaking availability of the Federal hydro system generation when averaged monthly over the top 6 HLH hours/day, 5 days/week, and 4 weeks/month capacity. This is termed 120-hour capacity. The 120-hour capacity curves were developed using HOSS hourly Federal hydro generation estimates to obtain monthly relationships between the monthly Federal system hydro energy generation to the amount of available 120-hour hydro capacity. This analysis assumes typical hourly load obligations and does not borrow water from future months, rather maximizes HLH hydro system generation using HLH and LLH marketing; and within month hydro flexibility.

This compares to the 1-hour operational peaking reduction that represents a reduction to the Federal system hydro resources in order to estimate the peaking availability of the hydro system to meet the monthly 1-hour peak demand. In a similar manner to the above analysis, 1-hour operational capacity curves were developed using HOSS hourly Federal hydro generation to obtain monthly relationships between the Federal hydro energy generation to the amount of 1-hour maximum Federal hydro generation. This analysis assumed typical hourly load obligations and does not borrow water from future months, rather maximizes HLH hydro system generation using HLH and LLH marketing and within month hydro flexibility.

Using hourly HOSS relationships of Federal hydro energy to available Federal hydro capacity, different time-spans of capacity availability can be calculated. Thus methods used in BPA's short-term planning can be easily integrated into BPA's long-term planning. The duration of such a planning methodology can be set to different levels of duration and probability to ensure an adequate supply of power to meet future capacity needs.

The Federal system 120-hour load obligations and resources are illustrated below in Figure 21. Similar to the 1-hour Federal system analysis, BPA tends to have capacity deficits in the January through May time period using 1937-critical water conditions. (See Section 4, "Federal Firm Monthly 1-Hour Capacity Surplus/Deficit Projections", Figure 9, page 31.) BPA would meet these deficits using methods described in Section 4, "Federal Resource Adequacy", page 34.

Figure 21

**OY 2007 Monthly Federal Firm 120-Hour Capacity Loads and Resources
Using 1937-Critical Water Conditions**

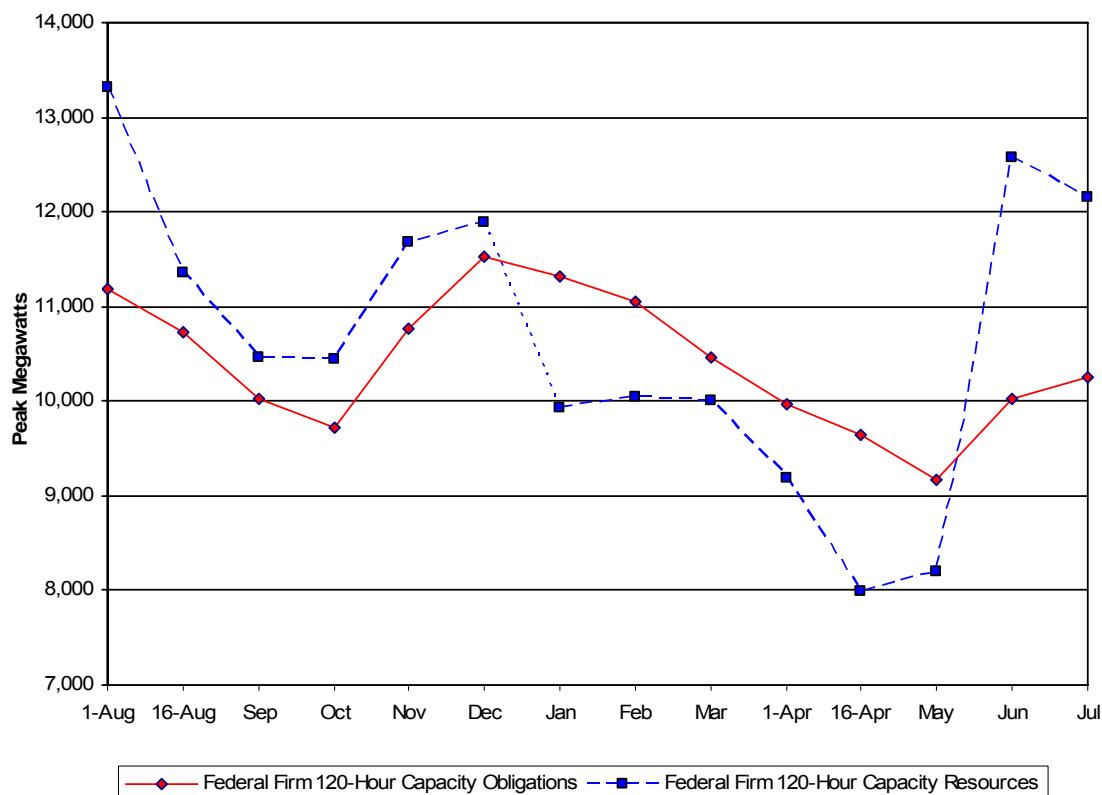

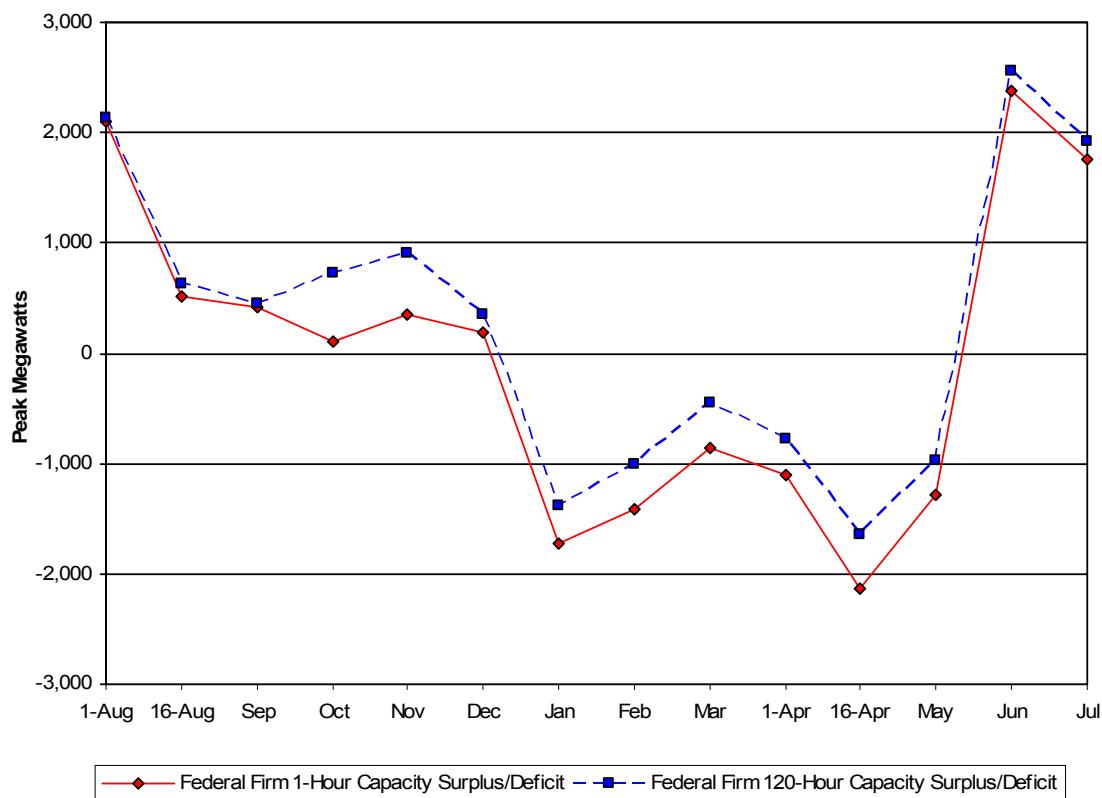

Figure 22, below, compares the Federal system 120-hour and 1-hour capacity surplus/deficits for OY 2007. The 120-hour Federal system capacity surpluses are generally larger and capacity deficits are generally smaller. This is mainly due to the fact that under low water conditions, the 120-hour Federal surplus/deficits include more hourly observations than those presented in a 1-hour study.

Figure 22

**OY 2007 Monthly Federal Firm Capacity Comparison of
120-Hour and 1-Hour Capacity Surplus/Deficits
Using 1937-Critical Water Conditions**

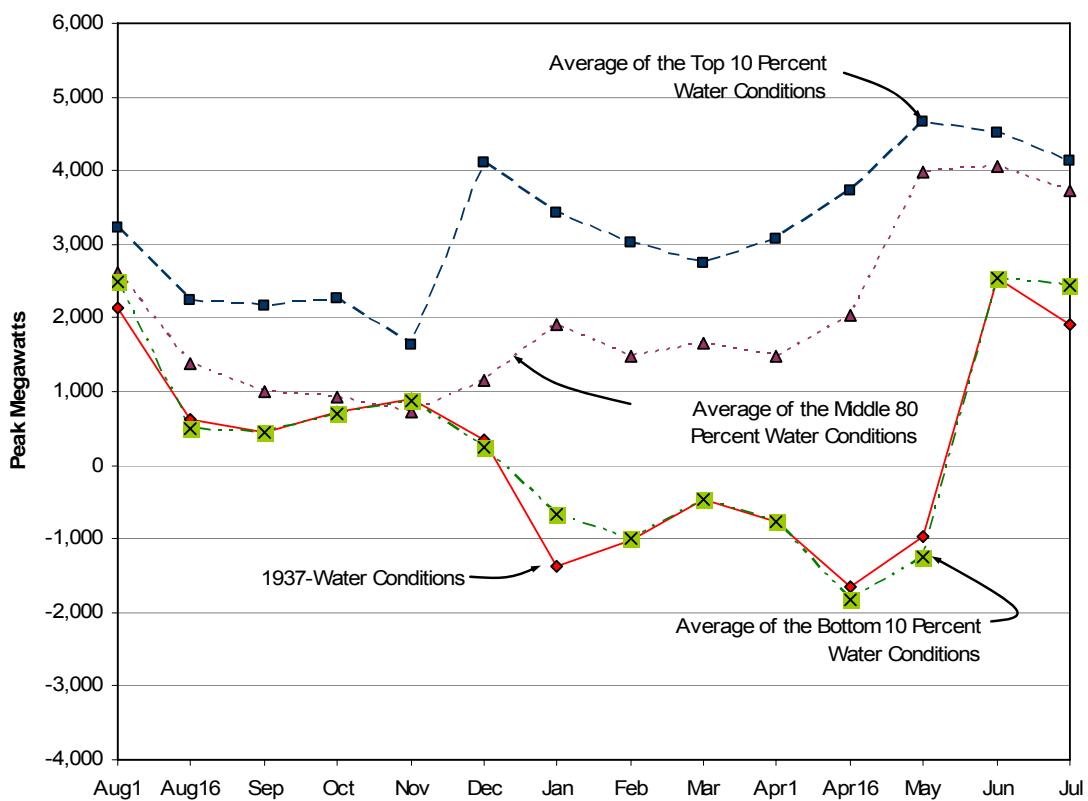

Potential Variability of Federal 120-Hour Capacity Surplus/Deficit Projections

To illustrate the potential variability of 120-hour Federal system capacity surplus/deficits, this study compares different scenarios using varying levels of Federal system generation based on water conditions and normal weather loads. Figure 23, below, compares the 120-hour Federal system capacity surplus/deficits under four scenarios: resources using 1937-critical water conditions (the base case of this study), the averages of the bottom ten percent, middle 80 percent, and top ten percent of the historical 50-water year conditions (1929 through 1978). Similar to the 1-hour Federal system analysis, as the Federal system experiences better water conditions, the availability of 120-hour capacity surpluses increases—especially in the January through May time period. (See Section 4, “Potential Variability of Federal 1-Hour Capacity Surplus/Deficit Projections”, Figure 11, page 33.)

Section 11: Administrator's Record of Decision on the 2006 Pacific Northwest Loads and Resources Study

THIS PAGE INTENTIONALLY LEFT BLANK

Section 11: Administrator's Record of Decision on the 2006 Pacific Northwest Loads and Resources Study (The White Book)

I. Introduction

The 2006 Pacific Northwest Loads and Resources Study (White Book) establishes the Bonneville Power Administration's (BPA) long range planning basis for supplying electric power to BPA customers. The White Book is not an operational planning guide, nor is it used for BPA rate setting purposes under section 7(i) of the Northwest Power Act. The White Book includes projected Federal system and regional loads and resources with detailed technical appendices. The White Book compiles loads, contracts, and resource capability estimates for Pacific Northwest (PNW) public agency, public utility, cooperative, U.S. Bureau of Reclamation (USBR), investor-owned utility (IOU), and direct service industrial (DSI) customers. The estimates are obtained from (1) forecasts prepared by BPA; (2) direct submittals to BPA; (3) annual data submittals to the Pacific Northwest Utilities Conference Committee; and (4) data submittals to the Pacific Northwest Coordination Agreement (PNCA) Operating Committee. Hydro estimates are produced using BPA's hydro regulator to forecast PNW hydroelectric energy production by project. BPA uses the White Book to project potential Federal system and regional load and resource estimates over the planning period.

The White Book's long-range planning basis for supplying electric power remains important as a valuable planning document for both BPA and the PNW region. BPA will continue to update it and make it publicly available. This 2006 White Book updates the 2004 White Book and represents projections of Federal system and regional load and resource capabilities to be used as inputs to BPA's resource planning process.

II. Statutory Background

With the passage of the Northwest Power Act in December 1980, Congress directed BPA to assure the Pacific Northwest an adequate, efficient, economic, and reliable power supply. *16 U.S.C. §839(2)*. In order to carry out this mandate, BPA was directed by Congress to offer new power sales contracts (PSCs) to its regional firm power customers and to plan and acquire firm resources sufficient to meet these firm power loads. *16 U.S.C. §839c(g)*. These initial contracts had provisions that, under certain conditions, allowed purchasers to add or remove their non-Federal firm resources. Notably, the load and resources, as determined in the White Book, was referenced within such provisions.

Section 5(b)(1) of the Northwest Power Act obligates BPA to serve, in accordance with the terms of contracts, the net firm power load requirements of utilities in the PNW including Federal agencies, public agencies, public utility cooperatives, and IOUs. Section 5(d) authorizes BPA to serve up to a defined amount of the firm power load requirements of its existing DSI customers. *16 U.S.C. §839c(b)(1) and (d)*. Under section 5(b)(1), BPA is to offer to sell firm power from the Federal system to meet the firm regional loads of a customer in excess of its firm resources, if any, which the customer must dedicate to use or has dedicated to use for service of its own regional firm loads. *16 U.S.C. §839c(b)(1)(A) and (B)*. BPA is also to provide electric power for

those firm loads that were served by a customer's dedicated resource if the Administrator determines that a customer's dedicated resource is no longer available to serve its loads due to obsolescence, retirement, loss of the resource, or loss of contractual rights. BPA's obligation to supply firm power to its Northwest customers may be adjusted by a determination made under section 9(c) of the Northwest Power Act or section 3(d) of the Northwest Preference Act, regarding a customer's sale or disposition of firm power outside the Pacific Northwest region. 16 U.S.C. 839f(c); 837b(d).

Section 6(a)(2) of the Northwest Power Act obligates BPA to acquire sufficient resources, on a planning basis, to meet its firm load obligations, including its section 5(b)(1) and 5(d) contract obligations. BPA's obligations to provide firm electric power to its utility customers' for their regional firm loads and its contract obligations to provide firm power to its DSI customers comprise the largest portion of BPA's firm power contract obligations. 16 U.S.C. §839c(b)(1) and (d).

III. BPA's Utility Power Sales Contract Obligations

BPA executed 5- or 10-year PSCs with Federal agency, public agency, public utility cooperative, USBR, IOU, and DSI customers that began October 1, 2001. The following sets forth BPA's PSC firm power load obligations projected for the 2006 White Book study period:

- BPA's Federal agency, public agency, cooperative, and USBR customers signed either 5- or 10-year PSCs. Some of the public agencies, and cooperatives signed up for the 10-year Slice Product. BPA's PSC and Slice obligations end September 30, 2011; however, this study assumes that BPA will meet these or similar load obligations under agreements through OY 2016. BPA's total public utility load obligations are estimated to range from 7,176 aMW in OY 2007 to 7,631 aMW in OY 2016. In actual operation, BPA's obligations to serve these customers may be higher or lower than those shown in this analysis;
- The IOU's signed the 10-year Residential Purchase and Sales Agreement (RPSA) settling BPA's obligations under Section 5(c) of the Northwest Power Act to the IOUs. 16 U.S.C. §839c(c)(1). As a result of negotiations in 2001, IOU RPSA settlement firm power deliveries were reduced in exchange for financial considerations through September 30, 2006. This resulted in a net IOU RPSA settlement power delivery of 258 aMW during this time period. For the period October 1, 2006, through September 30, 2011, this study assumes that BPA's IOU RPSA settlement contracts provide only financial benefits and no firm power is delivered. This assumption is consistent with the amendments made to the RPSA contracts by BPA and the IOUs on May 28, 2004; and
- BPA's DSI customers signed 5-year contracts effective from October 1, 2001, through September 30, 2006. BPA's DSI load obligations reflect signed load reduction agreements, contract terminations, and closures through March 31, 2006. BPA's DSI load obligations are estimated to be up to 265 aMW through September 30, 2006. For OY 2007, the DSI load obligations are estimated to annually average 44 aMW for the partial year. For October 1, 2006, through September 30, 2011, this study incorporates the policies adopted in BPA's "Service to Direct Service Industrial (DSI) Customers for Fiscal Years 2007-2011, Administrator's Record of Decision", published June 30, 2005, and the "Supplement to Administrator's Record of Decision on Bonneville Power Administration's Service to Direct Service Industrial (DSI) Customers for Fiscal

Years 2007-2011", (Supplemental DSI ROD) dated May 31, 2006. Beginning October 1, 2006, this study assumes that BPA will offer Port Townsend Paper Corporation 17 aMW of surplus firm power via a local preference customer. This delivery is shown as an Intra-regional transfer from BPA through a local preference customer for Port Townsend and is not shown as a DSI PSC load obligation. Actual DSI load obligations may differ from those presented in this study due to additional purchases or curtailments caused by changes in economic conditions. This assumption does not represent a decision by BPA as to whether or what form of DSI service will be offered post September 30, 2006.

IV. Excess Federal Power

This 2006 White Book is not a recalculation of or change in BPA's earlier published calculations of the amount of excess Federal power that may be sold by BPA under Public Law (P.L.) 104-46, §508(a) and (b). However, this White Book does provide a calculation of surplus firm power under section 5(f) of the Northwest Power Act. Surplus firm power is the amount of firm power in excess of BPA's total firm load obligations under subsections 5(b), (c), and (d) of the Northwest Power Act. 16 U.S.C. §839c(b); (c); and (d). This surplus power, if any, may be sold as either excess Federal power under P.L. 104-46, consistent with BPA's calculations of excess Federal power, or as surplus power under P.L. 88-552, section 5(f) and 9(c) of the Northwest Power Act. 16 U.S.C. §837(a); 16 U.S.C. §839c(f) and 16 U.S.C. §839f(c). To the extent that BPA has annual amounts of planned firm power that is surplus to its firm contract obligations, BPA may market all or a portion of that surplus power as excess Federal power. The duration of these sales will be as stated in BPA's Excess Federal Power Policy. For purposes of this White Book, a sale of excess Federal power with delivery occurring for a year or more is considered a firm obligation of BPA and is included as a firm obligation in Federal loads.

V. Federal System Obligation and Resource Updates

The 2006 White Book reflects Federal system load obligations, resources, and contracts that were finalized as of March 31, 2006. Changes to the Federal system obligations are as follows:

- Updated Federal agency, public agency, cooperative, and USBR PSC obligation forecasts;
- Revised Federal public agency and cooperative Slice customer obligations;
- DSI load obligations were changed to incorporate the policies adopted in BPA's Supplemental DSI ROD; and
- Updated Federal system contract sales.

The 2006 White Book also includes the following changes to the Federal system resource projections:

- The hydro regulation study was updated to incorporate BPA's most recent estimate of power and non-power requirements expected to be in effect during the study period;
- Acquisition contracts for the output from the Elwha and Glines Canyon hydro projects were extended from July 31, 2006, to September 30, 2009;

- Estimated start date for the Fourmile Hill Geothermal plant was revised from October 1, 2007, to October 1, 2009;
- Output from the Idaho Falls Bulb Turbine hydro projects changed from a Federal Independent Hydro resource to the City of Idaho Falls, due to the expiration of BPA's acquisition contract on September 30, 2006. This assumption may change depending on the disposition of a new Idaho Falls Bulb Turbine contract;
- Hellroaring (Big) Creek hydro project generation output changed from a Federal Independent Hydro resource to Mission Valley and remains a regional resource;
- Bonneville Fishway project was removed as a Federal resource to avoid double counting of the generation, which was previously included in the regulated hydro Bonneville Dam generation estimates; and
- Federal system contract purchases were updated.

Future studies will reflect new information as it becomes available.

VI. CONCLUSION:

For the foregoing reasons the methodology and the assumptions in the 2006 White Book are adopted and approved.

Issued in Portland, Oregon on December 1, 2006.

Administrator and Chief Executive Officer

Section 12: Glossary and Acronyms

THIS PAGE INTENTIONALLY LEFT BLANK

Glossary

Average Megawatts (aMW) – A unit of electrical consumption or production over a year. It is equivalent to the energy produced by the continuous use of 1 megawatt of capacity served over a period of 1 year. One average megawatt is equivalent to 8,760 megawatt hours or 8.76 gigawatt hours.

Bonneville Power Administration (BPA) – BPA is a Federal power marketing agency (PMA), responsible for acquiring and delivering power to meet contractual obligations and electrical needs of its customers.

Canadian Entitlement Return (CER) for Canada – The public agencies' obligation to return the Canadian Entitlement allocation to Canada under the Columbia River Treaty that began April 1, 1998.

Capacity – The maximum power that an electrical system or machine such as a hydro powered or thermal powered generating plant can produce under specified conditions, or that a power transmission line can carry.

Capacity Factor – The ratio of the average load on a machine or piece of equipment over a given period to maximum power rating of the machine or equipment.

Cogeneration – The sequential production of more than one form of energy, such as heat and electricity. Large industrial plants often are sources of electricity co-generated as a byproduct of a heating process.

Conservation – Any reduction in electrical power as a result of increases in the efficiency of energy end use, production, or distribution.

Critical Period – That portion of the historical streamflow record during which the recorded streamflows, combined with all available reservoir storage, produced the least amount of energy.

Dedicated Resources – Generating resources owned by a utility and used to serve its firm loads. These resources are declared in each utility's power sales contract with BPA.

Direct Service Industry (Industries) (DSI) – An industrial customer or group of industrial customers that purchase electric power directly from BPA. Most DSIs are aluminum and other primary metal smelting plants.

Energy Load – The demand for power averaged over a specified period of time.

Export – Electricity generated in the Pacific Northwest that is sold to another region, such as California.

Federal Columbia River Power System (FCRPS) – The FCRPS consists of 31 Federal hydroelectric projects constructed and operated by the U.S. Army Corps of Engineers (USACE), U.S. Bureau of Reclamation (USBR).

Federal System – The Federal system is a combination of BPA's customer loads and contractual obligations, transmission facilities, and resources from which BPA acquires the power it sells. The resources include plants operated by the U.S. Army Corps of Engineers (USACE), U.S. Bureau of Reclamation (USBR), and hydroelectric projects owned by the city of Idaho Falls, Lewis County PUC, and Energy Northwest (ENW). BPA markets the thermal generation from the Columbia Generating Station, operated by ENW.

Firm Capacity – Maximum on-peak electrical energy that is considered assured to meet all contractual peak load requirements over a defined period for a customer or customer group.

Firm Energy – Electric power that is considered assured to the customer to meet all contractual energy load requirements over a defined period for a customer or customer group.

Fiscal Year – In this study, fiscal year (FY) is the 12-month period October 1 to September 30. For example, FY 2006 is October 1, 2005, through September 30, 2006.

Forced Outage Reserve – Capacity that is held in reserve, for use in case a generating unit malfunctions.

Forebay – The portion of the reservoir at a hydroelectric plant that is immediately upstream of the generating station.

Historical Streamflow Record – The unregulated streamflow database of the 50 years from August 1928 through July 1978.

Hydroregulation – A study simulating operation of the Pacific Northwest electric power system that incorporates the historical streamflow record, monthly loads, thermal and other non-hydro resources, hydroelectric plant data for each project, and the constraints limiting each project's operation.

Independent Hydro – The output from hydropower plants that are not part of the regulated system. These plants are generally run-of-river. Examples are Cowlitz Falls or other small hydro plants whose output is used to serve load in the utility service territory in which it is located.

Import – Electricity that comes to the Pacific Northwest from another region. Examples would be purchases within the region from Canada, California, or western Montana.

Intra-regional Transfer – Sales of power between two parties within the Pacific Northwest region. Sales from an IOU to a public utility within the region are intraregional transfers, such as firm power sales from BPA to PNW entities.

Investor-Owned Utility (IOU) – A privately owned utility organized under State law as a corporation to provide electric power service and earn a profit for its stockholders.

Load Diversity – An adjustment applied to peak loads to reflect the fact that all peaking electrical demands do not occur simultaneously across the region.

Megawatt (MW) – A unit of electrical power equal to 1 million watts or 1,000 kilowatts.

Non-firm Energy – Electrical power produced by the hydro system that is available with water conditions better than those of the critical period without appreciably jeopardizing reservoir refill. It is available in varying amounts depending upon season and weather conditions.

Non-firm Energy Load – Load served by additional hydro energy available in “better-than-critical period” water conditions or can be interrupted in the event of a power deficiency on the supplying system.

Non-utility Generation – A generating project that is not owned by a utility, rather the project is owned by a third party, such as an independent power producer. The project output could be sold short- or long-term in the market.

Operational Peaking Adjustment – Federal hydro system monthly maximum operational capacity that is available to meet the 1-hour expected peak load for each of the 1929 through 1978 historical water conditions.

Operating Year – For this study, operating year (OY) is the 12-month period August 1 through July 31. For example, OY 2006 is August 1, 2005, through July 31, 2006.

Peak Load – The maximum demand for power during a specified period of time. There are usually two peaks to load each day (morning and evening, driven by residential patterns), six peaks to the week (Monday through Saturday, during “working hours”), and one or two months-long peaks to the year depending upon heating and/or cooling needs. The pattern of peak loads is called its “shape.”

Power Sales Contract Obligation – Capacity and energy the Federal system is required to provide to Federal agencies, public agencies, cooperatives, USBR, IOUs, and DSIs under their 1981 or 2001 power sales contracts with BPA.

Publicly Owned Utility - One of several types of not-for-profit utilities created by a group of voters, and can be a municipal utility, a public utility district, a cooperative, a mutual company, or a rural electric association.

Region – The geographic area defined by the Pacific Northwest Electric Power Planning and Conservation Act. It includes Oregon; Washington; Idaho; Montana west of the Continental Divide; portions of Nevada, Utah, and Wyoming that lie within the Columbia River drainage basin; and any rural electric cooperative customer not in the geographic area described above but served by BPA on the effective date of the Northwest Power Planning Act.

Regional Total Retail Load - The sum of all total retail load consumed in the PNW region as defined in the 1980 Pacific Northwest Electric Power Planning and Conservation Act.

Regulated Hydro – Hydropower plants that are part of the Columbia River hydro system that is operated jointly by BPA, the USACE, and the Bureau. Most of these are part of the mainstem system on the Columbia and Snake Rivers.

Renewable Resources – Resources that use solar, wind, hydro, geothermal, biomass, or a similar source of energy that is converted into electricity.

Resource Acquisitions – Conservation or generating resources acquired in order to meet projected firm energy deficits.

Slice of the System Product - A public-preference 10-year power sales contract product based on the customer’s net requirements that provides firm and secondary energy using a fixed percentage of the output generated by the Federal system Slice resources.

Spill – Electrical energy that cannot be accepted into the system and must either be sold or spilled due to constraints and limitations of hydro projects.

Spinning Reserves – Reserve generating capacity maintained for immediate response to meet load variations. This provides a regulating margin for controlling the automatic generation and frequency of power in the region and Federal system.

Surplus Firm Capacity – The maximum amount of assured electrical energy above the firm energy loads served by the power system.

Sustained Peak – The peaking capacity necessary to sustain a load for a given period of time.

Thermal Resources – Resources that burn coal, natural gas, or oil, or use nuclear fission to create heat which is then converted into electricity.
