DOE/NETL-IR-2007-235

Surface Modifications for Oxidation Resistance

David E. Alman

Paul D. Jablonski

Office of Research & Development

National Energy Technology Laboratory

NETL

8th Annual SECA Workshop – San Antonio, TX, August 7-9, 2007

Accomplishments

- **Surface treatment developed at NETL based on CeO_2**
  - Applied to over 50 commercial and experimental alloys including; T430, T441, Crofer22APU
  - For comparative purposes applied other RE surface treatment that are described in the literature.
  - RE Treatments are effective in enhancing oxidation resistance.
    - Initiated long term testing to determine effectiveness.
  - ASR measurements and single-cell test indicate surface treatment can enhance SOFC performance.
  - Modified NETL treatment to use La_2O_3
- **Investigated influence of Si levels on behavior of interconnect alloys**
  - Oxidation as a function of Si level in T430 (objective is to determine critical Si-level).

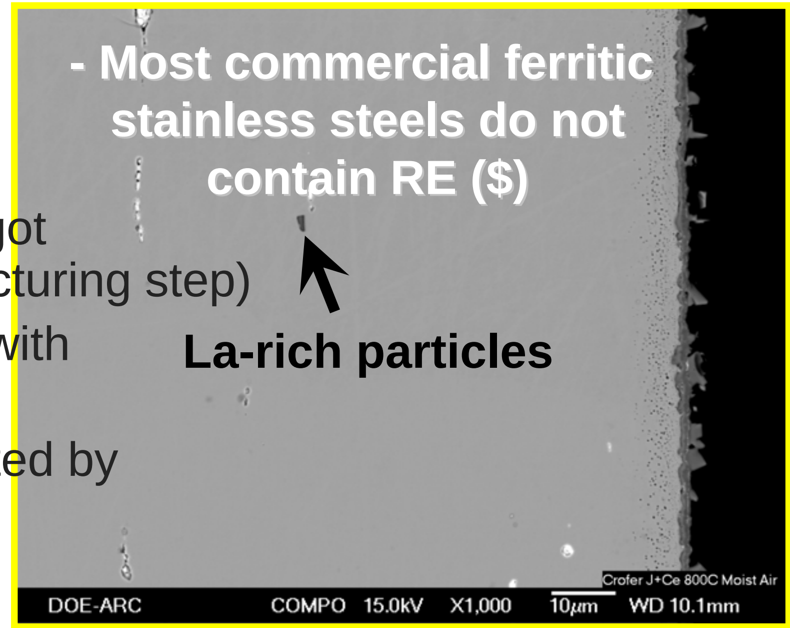
Reactive Element (RE) Effect

- **Well known that the addition of small amounts of RE (Ce, La, Y, etc) improves oxidation resistance**
- **Characteristics**
  - Reduction in the oxidation rate
    - Change in scale growth mechanisms
      - cation transport → anion transport
    - Modification of scale microstructure
      - large columnar grains → small equiaxial grains
  - Stabilize Cr_2O_3 scales at lower Cr levels
  - Improvement in scale adhesion

Alloy	*Fe*	*Cr*	*Mn*	*Si*	*Ti*	*Al*	*La*
Crofer 22APU	Bal	22.0	0.5	--	0.08	--	0.06 La
ZMG232	Bal	22.0	minor: Mn, Ni, Zr, La				

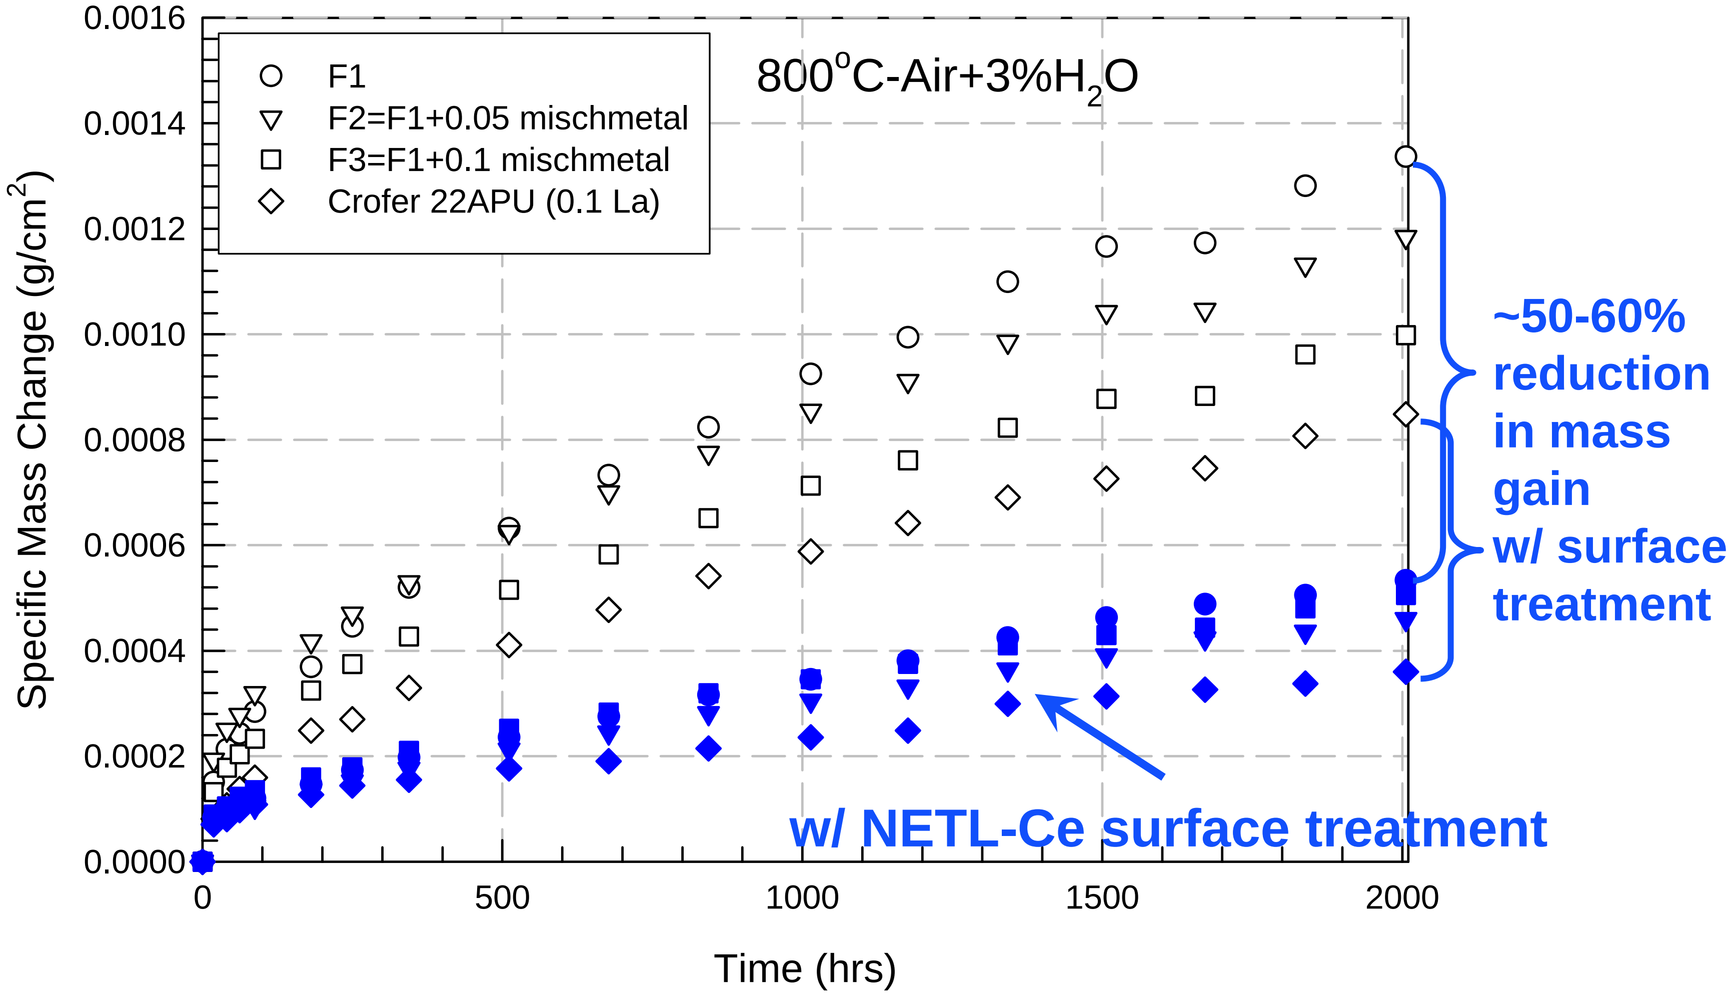
RE Surface Additions

- **Melt addition**
  - + Elements added during ingot production (single manufacturing step)
  - – Difficulty in melting (react with crucibles)
  - – Surface concentration limited by solubility and diffusivity



- **Surface treatments**
  - + Rare Earth concentrated where needed (at surface)
  - + Applied to any alloy
  - – ($) “Extra” manufacturing step.
  - ? Long term effectiveness (as with any coating or surface treatment)

Effect of RE on Oxidation



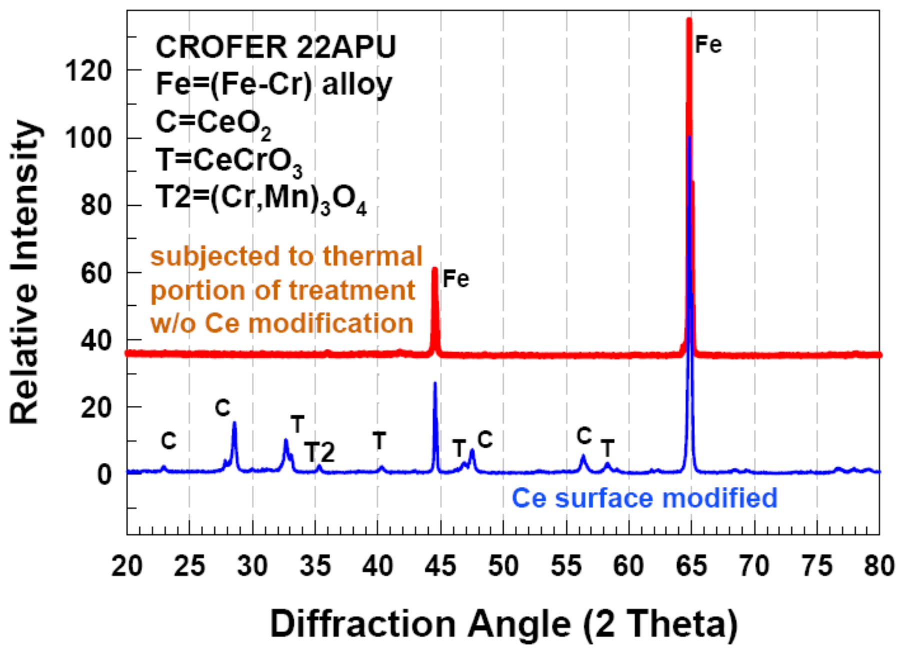
F1=Fe-22Cr-0.5Mn-0.1Ti   Mischmetal is a combination of Ce, La and other RE

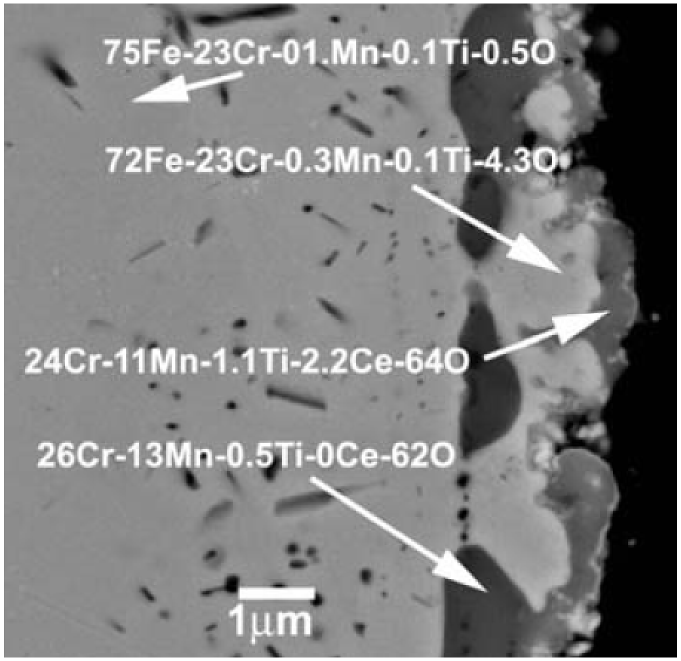
Cerium Surface Treatments

- **Developed a combination of pack cementation and superficially applied coating technique (NETL).**
  - Coat surface with a slurry mixture: **CeO_2** and halide (NaCl) activator.
  - Heat (**900^{o}C**) in a controlled atmosphere (x10^{-3}Torr)
  - Residual "pack" coating is washed off the surface.
- **Applied treatment described by Hou & Stringer (H/S).**
  - J. Electrochem. Soc., Vol 134, No. 7, July 1987, pp. 1836-1849.
  - Coupons heated to 200^{o}C were coated with a **cerium-nitrate** slurry (10w/o nitrate adjusted with HNO_3 to pH=2), followed by heating in air at **400^{o}C** to decompose to CeO_2.
  - Surface also cleaned in water after treatment.

Surface After Treating (CeO_2-NETL)

- The surface treatment pre-oxides the surface. Ce-rich oxide forms at the gas-substrate surface. A Cr-Mn oxide forms underneath the Ce-rich oxide.

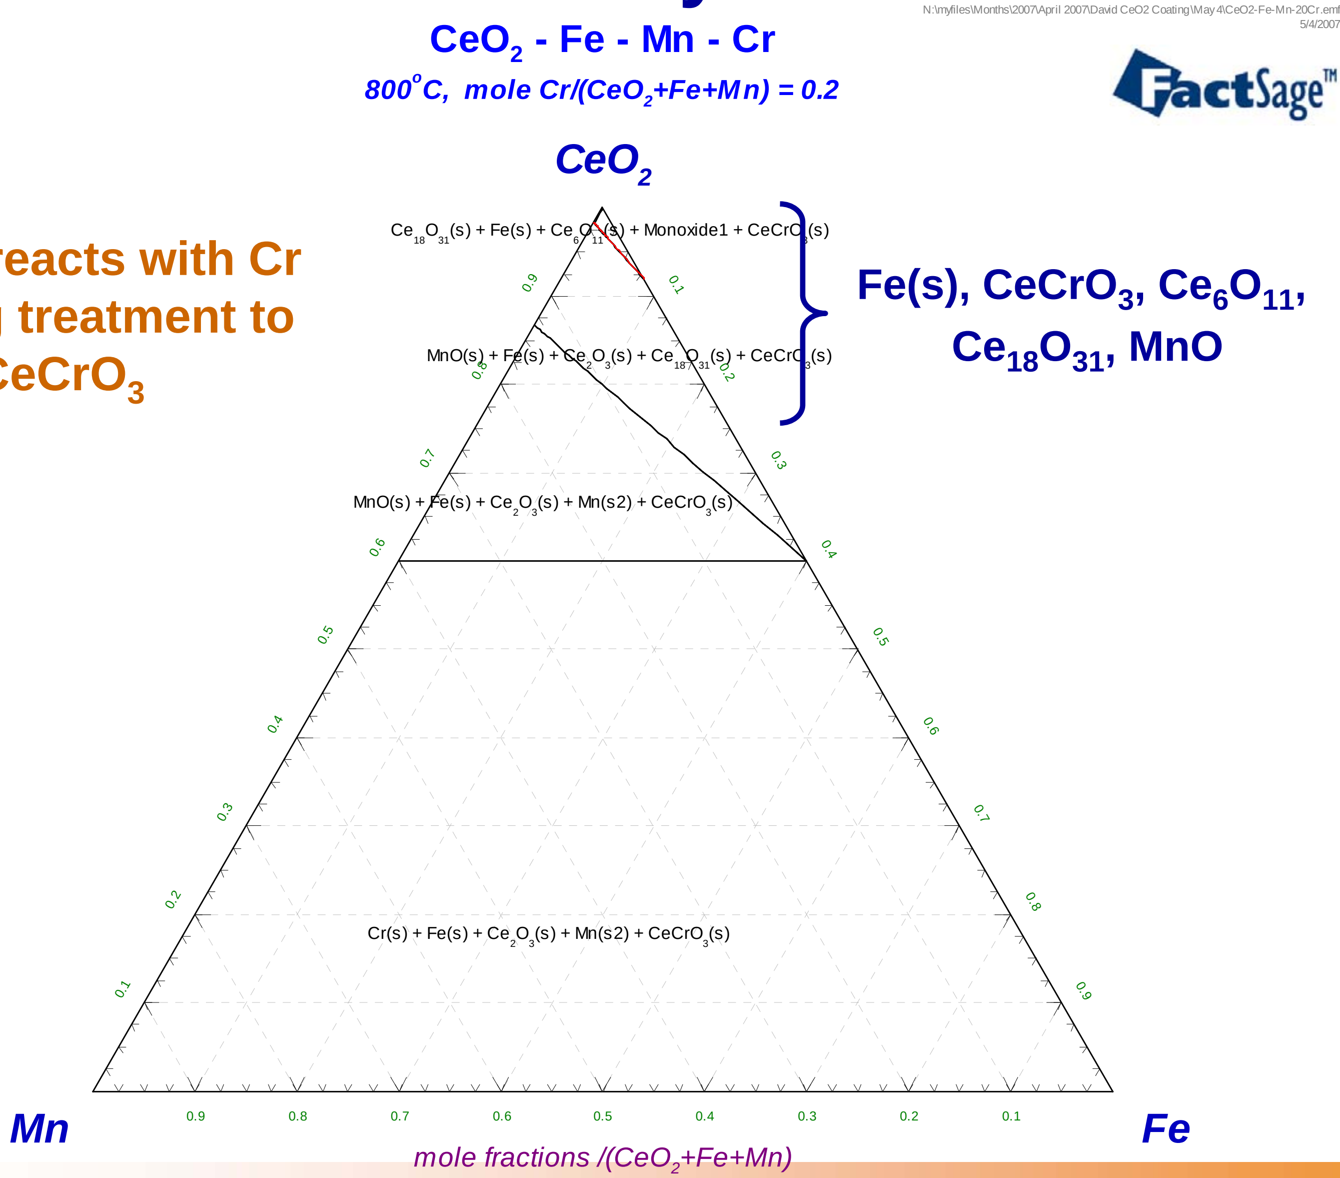




Crofer+Ce (NETL)

Thermodynamics

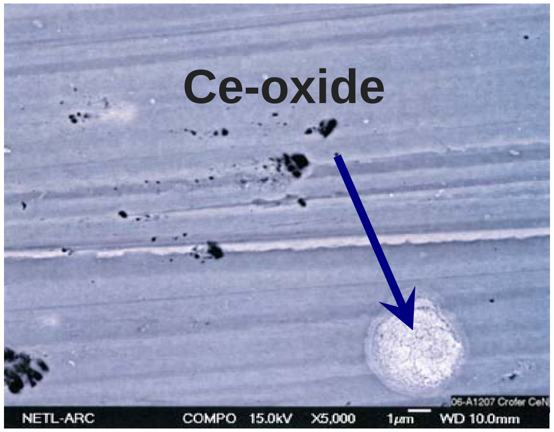
CeO$_2$ reacts with Cr during treatment to form CeCrO$_3$



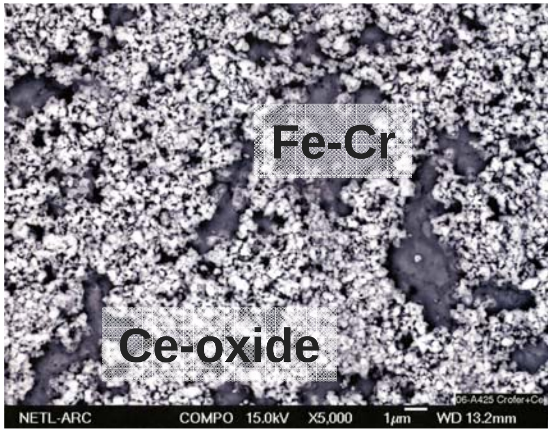
Fe(s), CeCrO$_3$, Ce$_6$O$_{11}$, Ce$_{18}$O$_{31}$, MnO

Surfaces After Treating

CeN-based (H/S: 400^{o}C)

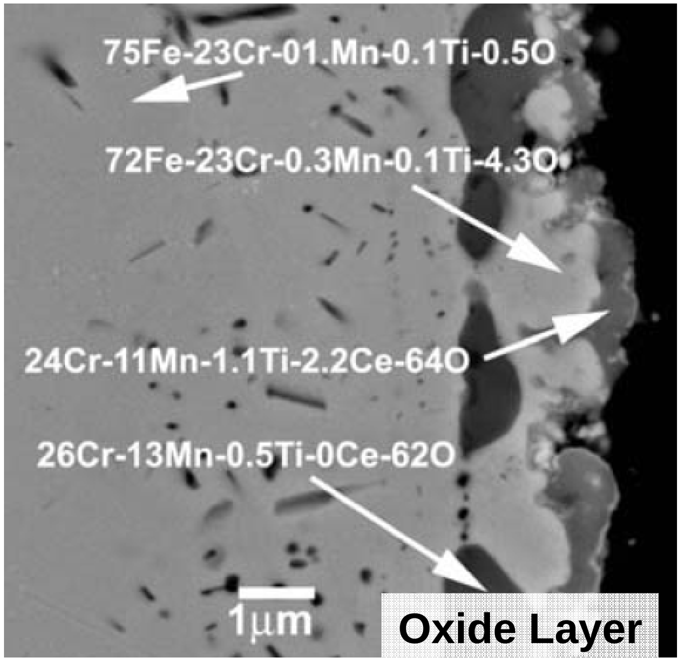


CeO_2-based (NETL:900^{o}C)



Surfaces After Treating (Prior to Oxidation)

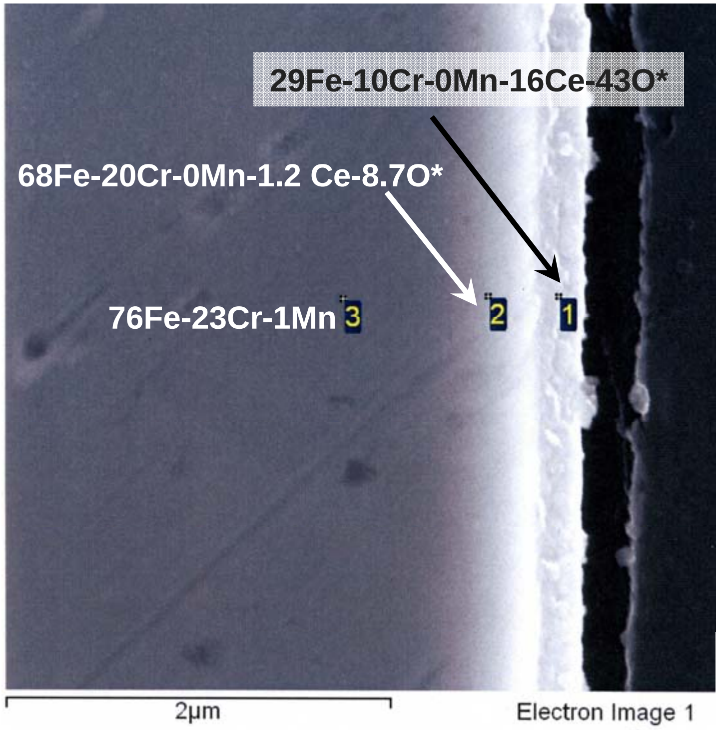
Crofer+Ce (NETL)



CeO_2-Based

Max Temp 900°C

Crofer+Ce (H/S)



CeN -Based

Max Temp 400°C

*not accurate due to edge effect (rounding of edge during sample preparation), however, indicates Ce is present at the surface.

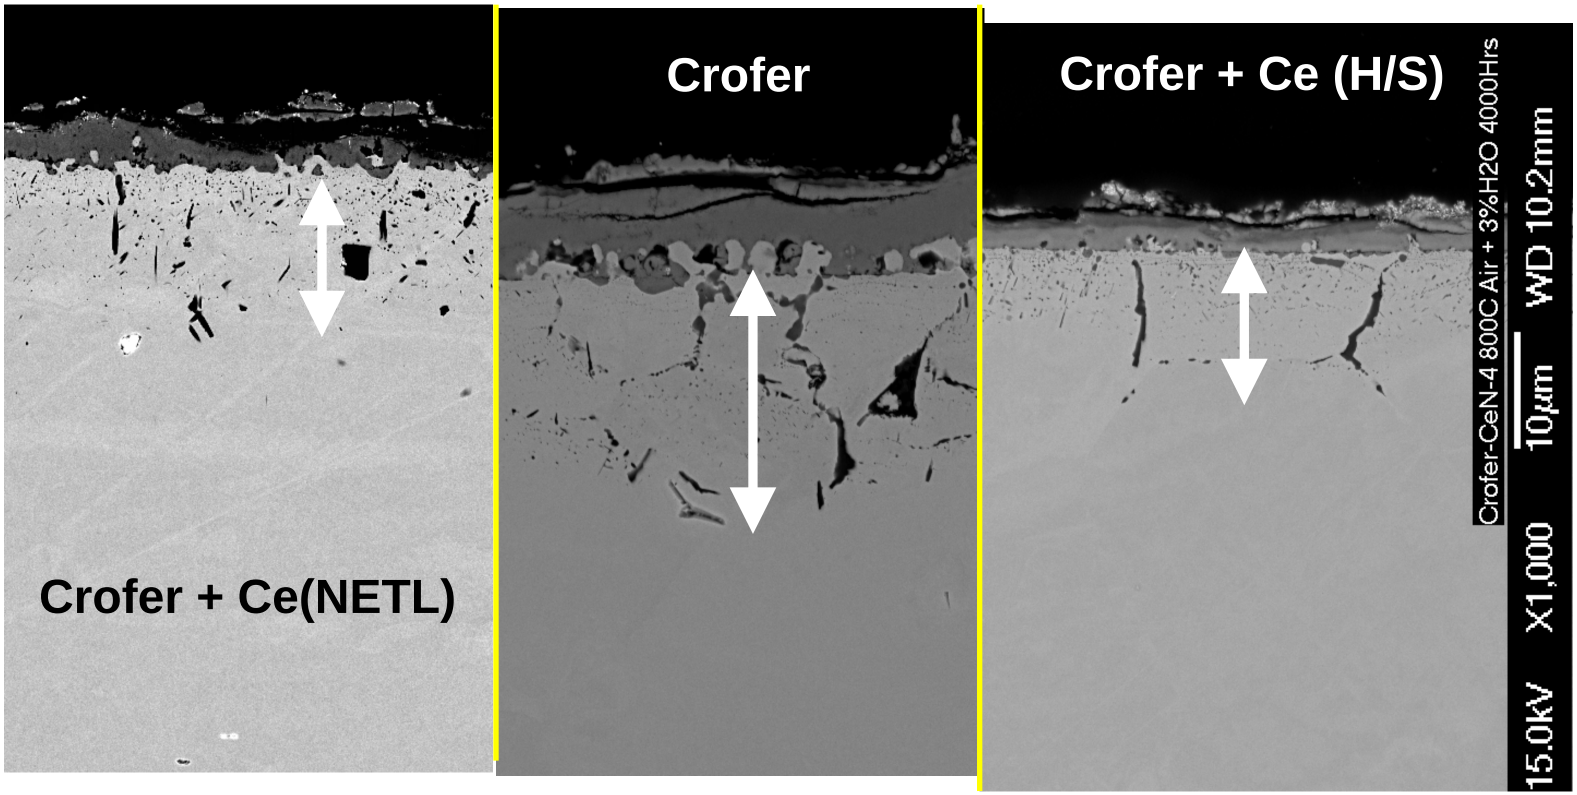
800^{o}C-4000hrs-Air+3%H_2O



Minimize internal oxidation

Surface Treatments

- **Slows scale growth**
  - Scale microstructures were similar with NETL and H/S treatment methods.
- **Minimizes internal oxidation.**
  - Indicates slows oxygen diffusion through the scale.
- **Ce at surface modifies initial stages of transient oxidation → alters the subsequent growth of the scale→ enhanced oxidation resistance.**
  - formation of $CeCrO_3$ – type oxide during transient oxidation.
  - Pre-oxidation during NETL treatment
    - (initial oxidation of H/S?)
- **Why?**
  - Scale microstructure is changed
    - (high diffusivity columnar to low diffusivity equiaxed)
  - Ce in oxide changes diffusion through oxide.
  - NETL-ORD IAES project at CMU to investigate influence of RE on transient oxidation.

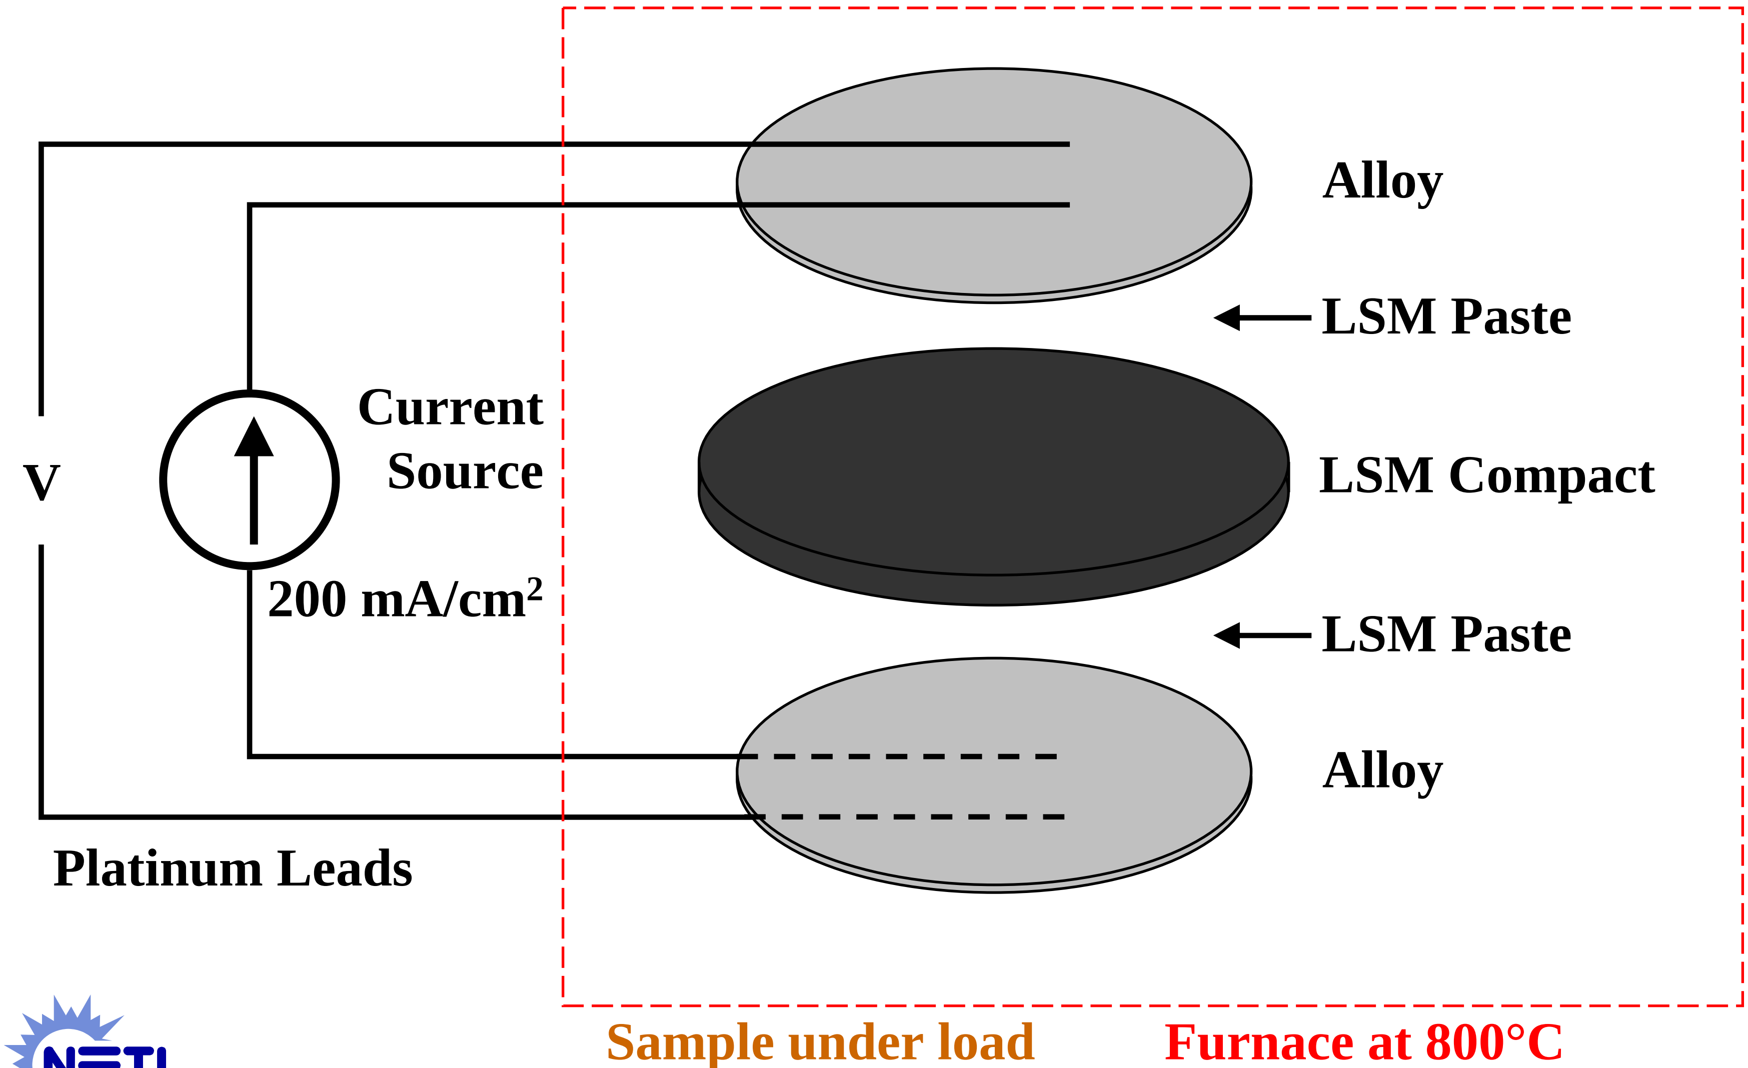
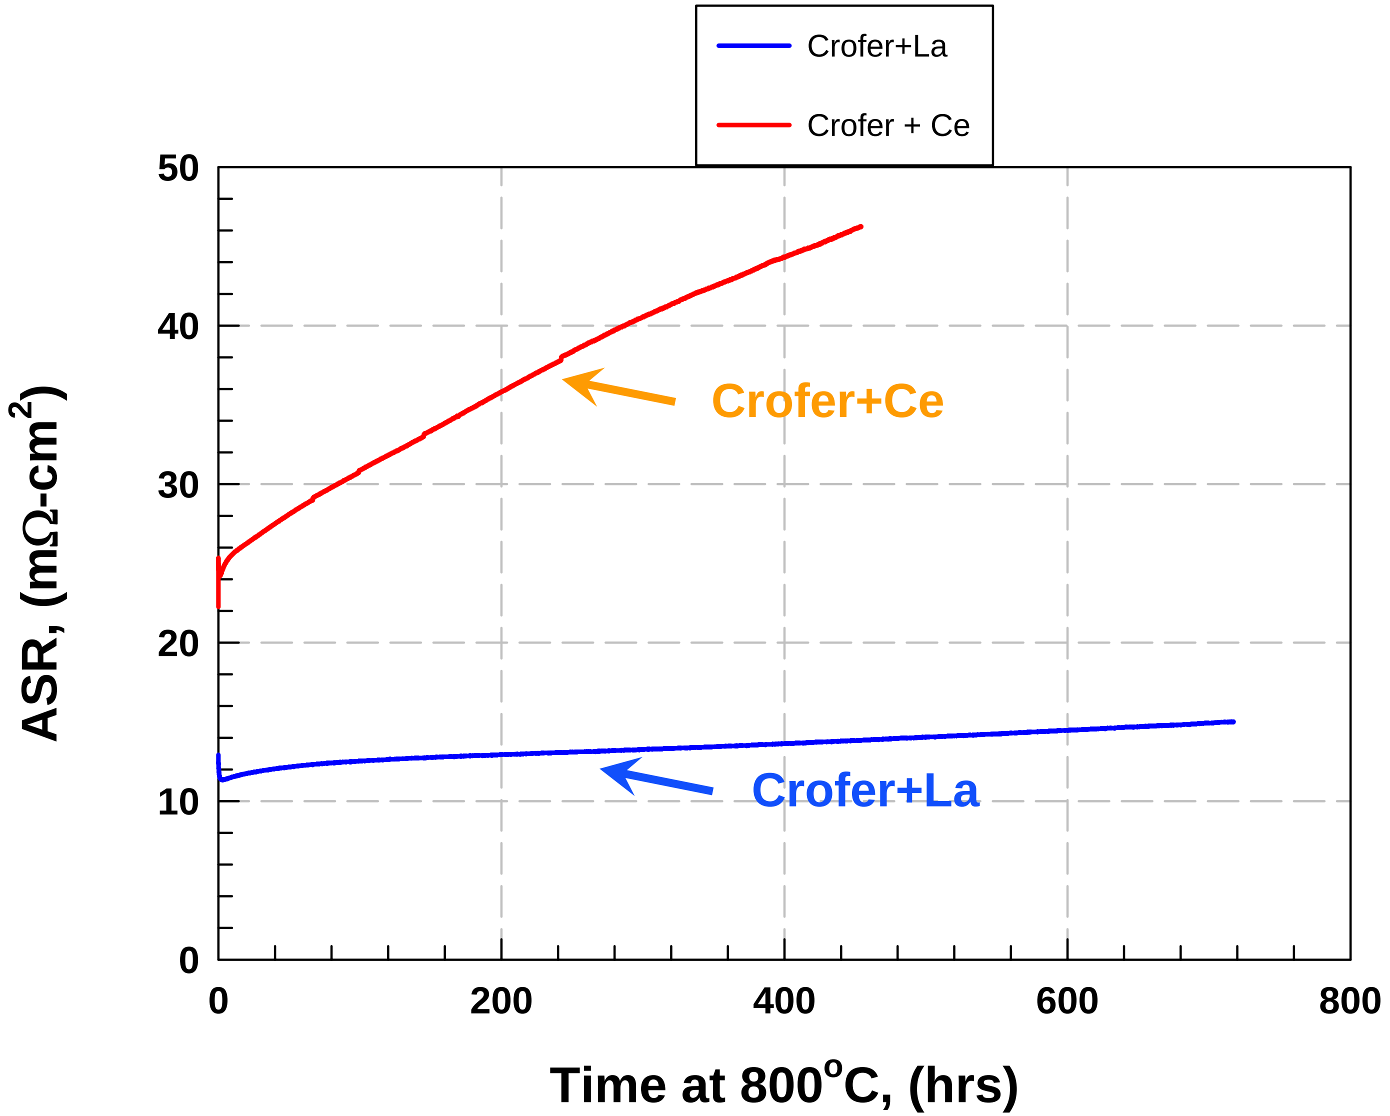
Initial Conductivity: ASR Experimental Setup



Electrical Performance



Summary

- **RE surface treatments effective in improving oxidation resistance.**
  - Applied to ferritic stainless steels for interconnect application (Crofer and Type 430).
  - Both Ce-based methods (NETL and H/S) were effective.
  - La modification to the NETL method was effective.
- **ASR measurements indicate that slower scale growth will enhance SOFC performance.**

On-Going and *Future Work*

- **Continue long term exposures on Ce- and La-treated samples**
  - to determine if and when breaks-down occurs
  - accelerated tests
  - *Analyze long term ASR (or cell tests)*
- **Continue investigation influence of Si content**
  - Determine critical Si level
  - *Low cost production of low Si steels using recycled scrap (develop innovative slag additives to getter Si during metling).*

Experimental Alloys and RE Surface Treated Materials Available For Evaluation by SECA Participants
