Analysis of Barrel Support Saddles and Forces between Modules during Assembly

Victor Guarino
Argonne National Laboratory
April 23, 2003

1. Introduction

As the Barrel Tile Calorimeter is constructed, the support saddles and the modules will be subjected to different forces, stresses, and deflections than when completely assembled. The purpose of this analysis is to examine the forces, stresses, and deflections acting on the support saddles and modules at various stages of assembly. The nominal weight of a barrel module is 20 tons. CERN Document number ATL-LB-EA-0001 "Summary of the Structural Analysis of the Barrel Support Saddles" describes in detail the structural analysis of the saddles and the completed barrel assembly. These calculations followed Eurocode 3.

The paper will be divided into the following sections:

1. Introduction
2. Model Description
3. Load Cases
4. Stability of Assembly
5. Forces between Modules
6. Inner Radius Bearing Connection
7. Outer Radius Connections
8. Swivel Bolt Forces and Torque
9. Reaction Forces
10. Deflections
11. Conclusion

Appendix 1 Forces between modules

Appendix 2 Inner Radius Bearing Stresses

Appendix 3 Outer radius Bearing Stresses

Appendix 4 Girder Bolt Forces

Appendix 5 Girder Bolt Normal Stresses

Appendix 6 Girder Thread Shear Stresses

Appendix 7 Swivel Bolt and Saddle Key Forces

Appendix 8 Swivel Bolt Normal Stresses

Appendix 9 Swivel Bolt Thread Shear Stresses in Saddle

Appendix 10 Swivel Bolt Torques

Appendix 11 Fiducial Mark Displacements

2. Model Description

In the FE model of the saddle and back cryostat support the Z axis ran along the beam line, the Y axis was in the vertical direction, and the X axis was horizontal.

Software used: COSMOS/M and SolidWorks

Type of Elements: Solid

Number of Elements: 78,355

Material: Stainless Steel, $E = 206,000 \text{ MPa}$

Code applied: Eurocode 3

A complete description of how the modules, connections within and between modules, and support saddles were modeled can be found in ANL Technical Report # ANL-HEP-TR-01-097, “Extended Barrel Support Saddle Design and Analysis”.

3. Load Cases

There were eight load cases examined to date. All of the loads are at their nominal values. These are described below:

BA1 - 64 modules in place with cryostat load

BA2 - 64 modules in place without cryostat load

BA3 - 48 modules in place without cryostat load

BA4 - 32 modules in place without cryostat load

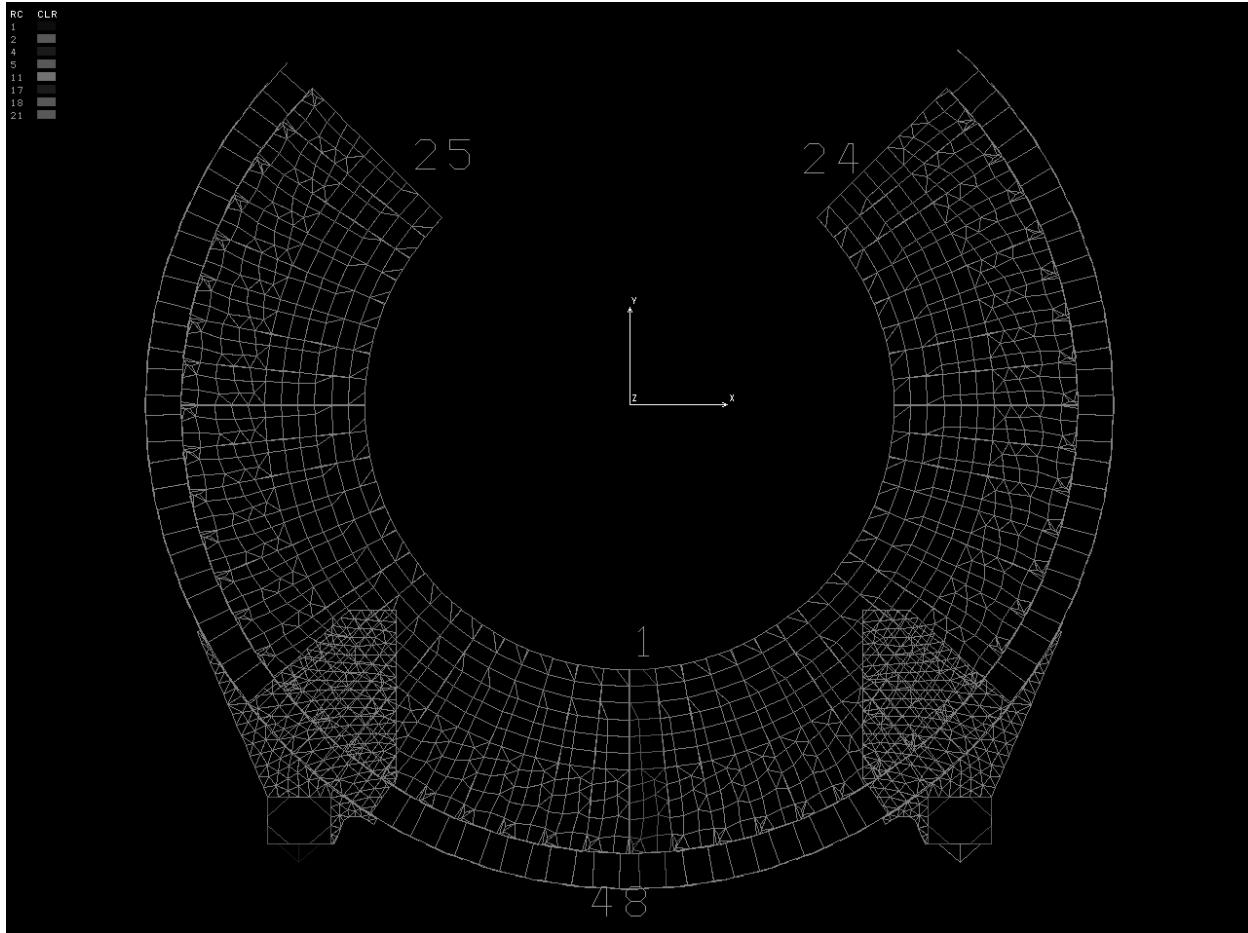

BA5 - 16 modules in place without cryostat load

BA6 - 16 modules in place without cryostat load and with support cradle

BA7 - 18 modules in place without cryostat load

BA8 - 18 modules in place without cryostat load and with support cradle

The figure below is an example of how modules are numbered.

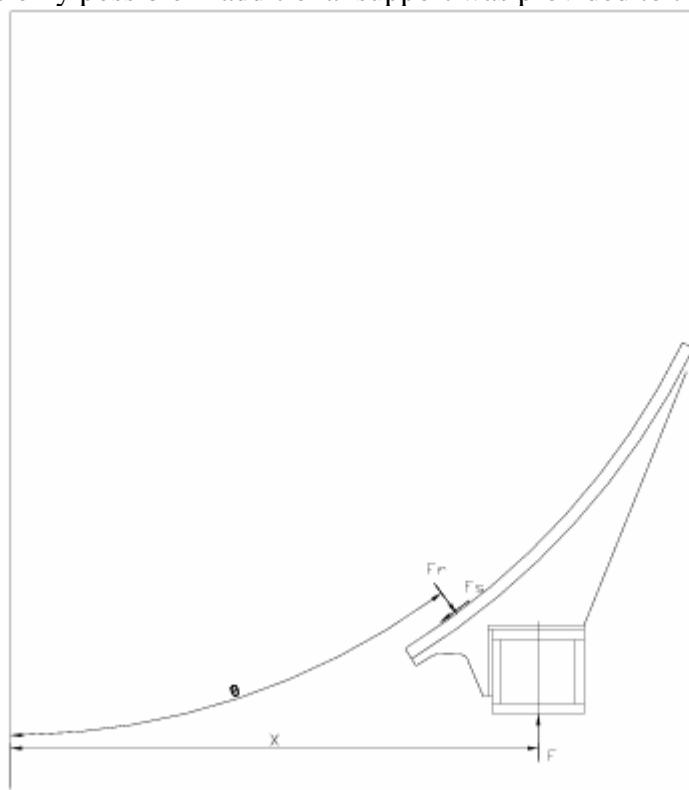

4. Stability of Assembly

Static analysis of the saddle shows that the assembly structure is not stable when there are only 16 modules in place and if the support cradle is moved. This load case was examined by performing some simple hand calculations and with a 2D fortran program which solved for the reaction forces on the saddle. With the constraint that the swivel bolt forces must be in compression in both of these load cases it was found that a

static solution was only possible if additional support was provided to the saddles or modules below the

saddle.

Static Analysis of Load Case BA5 - 16 modules in place.

The figure above shows a simplified location of forces being applied to the saddle in load case BA5 in which there are 16 modules in place that are only supported by the saddle. With only 16 modules in place only 1 swivel bolt and the key are in contact. The reaction force F is known is equal to 8 times the weight of a module. The saddle reaction forces F_r and F_s can be easily solved by statics as shown below:

$$\Sigma F_y \quad F_r \cos \theta + F_s \sin \theta = F$$

$$\Sigma F_x \quad F_r \sin \theta = F_s \cos \theta$$

$$F_r = F \cos \theta$$

$$F_s = F \sin \theta$$

However, the sum of the moments about the IP must be equal to zero in order to achieve equilibrium, therefore:

$$\Sigma M_{IP} \quad -RF_s + XF = 0$$

Solving for X we find:

$$X = \frac{RF_s}{F}$$

$$X = R \sin \theta$$

If the angle is:

$$\theta \approx 34^0$$

$$X \approx .56R$$

Using R=4,173mm we find that X=2,333mm which is not underneath the saddle support beam. If the support point is located at 3,000mm at the center of the support beam then an additional moment [M=(3000mm-X)*F] is needed in order to achieve static equilibrium.

In order to achieve equilibrium during assembly the support cradle that is used to initially assemble the first 12 modules will have to be kept in place. In this case the support cradle carries the entire load of the modules and only a minimal load is applied to the saddles. A further static analysis shows that the structure becomes stable when there are 18 modules in place and the cradle has been removed. The cradle will need to be in place until that point.

Load Case BA5 has 16 modules in place that are supported only by the saddle. The FEA model for this load case gives reasonable values for the forces between modules and on the saddle. However, the reaction forces at the bottom of the saddle support beam do not sum to zero and the application of a very small force in the X direction to the saddle results in extremely large deflections. The FEA model therefore is not in a stable equilibrium as predicted by this static analysis. The results for this model are considered invalid. However, in model BA7 there are 18 modules in place with the cradle support. In this case the FEA model is stable, the forces sum to zero and the application of a force in the X direction does not lead to any perturbations. This is consistent with the static analysis that the structure is stable with 18 modules in place

Static Analysis with Cradle and Saddles in Place

With the support cradle and saddle in place supporting the modules it is not possible to do a static analysis to solve for the forces acting on the cradle, saddle, and modules without making some simplifying assumptions because the entire structure is indeterminate. However, we can examine the equilibrium of the saddle. There are only three forces acting on the saddle as shown in the Figure above and all of these are unknowns. The force F is the force which supports the saddle at the main support beam. When the cradle is not in place F equals the weight of the structure as shown in the static analysis above. However, with the cradle in place F becomes an unknown because a proportion of the weight is carried by the cradle. The value of F depends upon the stiffness of the entire structure. The equilibrium equations for the saddle are described below and are similar to the static analysis above, except that F in this case is an unknown.

$$\Sigma F_y \quad F_r \cos \theta r + F_s \sin \theta s + F = 0$$

$$\Sigma F_x \quad F_r \sin \theta r = F_s \cos \theta s$$

$$F_s = F_r \frac{\sin \theta_r}{\cos \theta_s}$$

$$\Sigma M_{IP} \quad -RF_s + XF = 0$$

If θr and θs are equal and we solve these equations to eliminate Fr and Fs from these equations to get:

$$F \left(\frac{\cos^2 \theta}{\sin \theta} + \sin \theta \right) \left(\frac{X}{R} \right) - F = 0$$

This equation is satisfied if F equals zero or if:

$$\frac{X}{R} - \sin \theta = 0$$

In order to achieve stability X must equal 3,000mm and θ must equal the angle of the key. But this is not the case because if R=4173 then $\theta = 45.9^\circ$. However, the angle to the key is 36.56 so the structure cannot be in equilibrium. If we force $\theta = 36.56^\circ$ and solve for X we find that X=2485 which is not under the saddle support beam.

With the geometry that we have it will only be possible to achieve equilibrium with the cradle in place if the forces acting on the saddle are zero. This can only occur if the modules/BARRELis sufficiently stiff so that the entire load is transferred through the modules and to the cradle. If the modules deflect significantly in the region of the saddle then load will be transferred to the saddles.

Load Case BA8 has 16 modules in place with the cradle and saddles. The forces on the saddle are zero and all of the load is transferred to the support cradle in order to achieve equilibrium as predicted by the simple static analysis.

5. Forces Between Modules

The forces between modules for each of the load cases are shown in Appendix 1. These forces are used throughout the remainder of the analysis to evaluate the connections between modules.

6. Inner Radius Bearing Connection

The bearing stress on the inner radius weld bars have been calculated and are shown in Appendix 2. A 5mm wide bearing area of the weld bar is used in this calculation. The force P1, which is the force per unit length, given in Appendix 1 was used in this calculation.

The largest bearing stresses occur are 149 MPa at modules 15-16 in load case BA1 with 64 modules and the cryostat load in place.

Earlier tests on the ability of the front plate to withstand the bearing load at the inner radius have shown that plastic deformation of the front plate occurs when a bearing load of 38tons applied to a submodule (1694 N/mm). Failure of the welds and the front plate occurred in these tests at a maximum load of 85 tons applied to three modules (3,789 N/mm). In these tests the entire bearing load was transferred through the front plate. The front plate bearing load is far below the loads of these tests.

7. Connections Between Modules at the Outer Radius

The modules are connected together at the outer radius of the modules by a series of connecting plates. The details of this connection and the forces acting on it are shown in the figure below. M30 bolts and 33mm diameter pins must resist tension and a shearing forces at the outer radius. At the bottom of the extended barrel the bearing force, P2, results in tension between the modules, this is resisted by replacing a portion of the M30 bolts with 33mm diameter pins in modules 1-6 and 58-64. At the very top of the extended barrel the bearing force, P2, is also tension, however, this is much smaller than at the bottom so it will be resisted

by generating a friction force by the M30 bolts. In the remainder of the detector the bearing force, P2, is compression and this is resisted by the bearing surface between the outer radius of the modules.

7.1 Bearing Force at Outer Radius.

The bearing force at the outer radius, P2, is distributed over a 37.5mm thick plate on the outer radius of the girder. Therefore, the bearing stress can be simply calculated as $P2/37.5\text{mm}$ and is listed in Appendix 3. The positions that are in tension have a "T" and the force P2 in those locations are carried by a 33mm diameter pin below the saddle or friction above the saddle. It can be seen in the tables in Appendix 3 that the bearing stresses are all small and well below the acceptable limit of 192 MPa (240MPa yield stress divided by 1.25%).

7.2 Tension Connection at the Outer Radius

The tension force, P2, at the outer radius will be carried by 33mm diameter pins in the modules below the saddle (module #'s 1-6 and 58-64) and by friction throughout the remainder of the Barrel.

The length of the module that a given set of 2 pins carries the force is 350mm. According to EUROCODE 3, chapter 6.5, the maximum design load on the pin connection is the minimal of:

$$Fv = \frac{0.6 \bullet fur \bullet A}{yMr}$$

$$Fb = \frac{2.5 \bullet a \bullet fu \bullet do \bullet t}{yMr}$$

where:

A = pin section

Fv = shear resistance per shear plane

fur = ultimate tensile strength of the pin

yMr = safety factor (1.25)

Fb = Bearing resistance

fu = ultimate tensile strength of the basis material

do = diameter of the pin hole

t = plate thickness

a = parameter (see ENV 1993-1-1, pag. 156)

Applying the above mentioned formulas we get the values:

$$Fv = 492 \text{ KN} ; Fb = 355 \text{ kN}$$

So, the design load per pin is 355 kN. For a set of pins the design load is 710 kN which is equivalent to 2,028 N/mm (710kN/350mm). The force P2 is below this value everywhere.

7.3 Tension Connection Carried by Friction

In modules #7 to 57 the tension force at the outer radius, P₂, is carried by friction. A pre-stress of 726 MPa is going to be applied to the bolts. Using a safety factor of 1.5 on the pre-stress the normal force from this pre-stress is: $N = S * \text{Area} / 1.5 = 726 \text{ MPa} * 539 \text{ mm}^2 / 1.5 = 261 \text{ kN}$

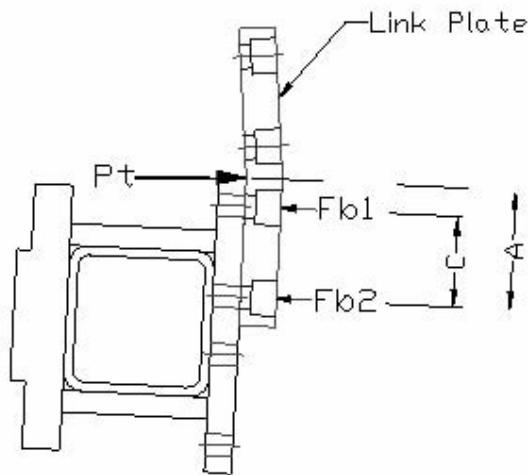

Using a coefficient of friction of .2 the maximum tension load is calculated as:

$$T = \mu N = .2 * 261 \text{ kN} = 52 \text{ kN}$$

Since there are two bolts for every 175mm of length in Z this results in a tension load, P₂, of:

$$P_{2\max} = 2T / 175 \text{ mm} = 52 \text{ kN} * 2 / 175 \text{ mm} = 594 \text{ N/mm}$$

The value of P₂ above the saddle is below this value in all of the load cases as seen in Appendix 1.

Forces Acting on Connecting Plate

7.4 Calculation of the Girder/Link Plate Bolt Stresses

At a given connection between modules the force P_t is resisted as shown in the figure above. Solving for the forces on the bolts we find:

$$F_{b1} = \frac{P_t \bullet L \bullet A}{C}$$

$$F_{b2} = (P_t \bullet L) \bullet \left(1 - \frac{A}{C}\right)$$

A = 165mm
C = 125mm

Pt is a force distributed over the length of the module in Z. L is the length of the module that a given bolt acting upon, on average this is one bolt per 175mm in the modules 7-57 and 350mm in modules 1-6 and 58-64.

The stress in the bolts is:

$$\sigma = \frac{F}{A}$$

F = bolt force (Fb1 or Fb2) increased by 25% per Eurocode
A = area of bolt = 539mm^2

The bolt normal stresses are shown in Appendix 5

A M30 class 10.4 bolt will be used which has a yield stress of 1,000 N/mm^2. The maximum normal stress 425 MPa which is well below this value so all of the normal stresses on the bolts are within acceptable limits.

It had been planned to apply a pre-stress of 726 N/mm^2 to the M30 bolts on the link plates in order to achieve the required friction force. A pre-stress of 726 N/mm^2 would give an additional safety factor of 1.72 (a safety factor of 1.25 per Eurode is already applied) on all of the bolts.

The shear stress of the internal threads of the bolted connection are calculated by:

$$\tau = \frac{F}{A}$$

F = bolt force (Fb1 or Fb2) increased by 25% per Eurocode

A = .87 * pi * D*L = 2,849 mm^2
D = minor diameter of the thread = 27.8mm
L = length of engagement = 37.5mm

The shears stresses on the internal threads are shown in Appendix 6.

The maximum allowable shear stress in the girder material is 138Mpa. The maximum shear stress that occurs is in load case BC1 and is 80.4MPa which is below the maximum allowable value.

8. Swivel Bolt Forces and Torques

The force on the saddles from the BARREL also change as the modules are assembled. These are shown in Appendix 7 for each Z position. It should be noted that there are three swivel bolts per Z position. The

forces in Appendix 7, therefore, need to be divided by 3 in order to find the force per swivel bolt. Once again, the maximum loads on the saddle occur in when the entire BARREL has been assembled. There are two special cases; BA6 and BA8 when the support cradle. In both of these load cases the forces on the saddle are zero because the load of the modules is being supported entirely by the support cradle.

8.1 Swivel Bolt stresses

The normal stresses in the swivel bolts are listed in Appendix 8. The swivel bolts are made from 4140 steel with a tensile strength of 675Mpa. Using the Eurocode to calculate the acceptable stress level for the bolt we find them to be 540 Mpa normal stress. The maximum normal stress is 390 MPa which is well below the maximum allowable load.

For the shears stress in the stainless steel (304L) saddle the maximum allowable shear stress is 138Mpa. Appendix 9 lists the shear stress in the saddle swivel bolt threads. The maximum is 36MPa which is well below the allowable stress.

8.2 Swivel Bolt Torques

Swivel bolts support the load of the Barrel on the Saddles. It is important to know the exact force on the swivel bolts during the assembly process. In order to get an estimate of the force acting on the swivel bolts the torque on the bolts will be measured. The relationship between the torque on a bolt and the force applied to a bolt though is complicated and often difficult to predict. Therefore, a series of tests were conducted in order to empirically measure the relationship between torque and force on swivel bolts. Appendix 10 lists the torques for each of the swivel bolts.

9. Reaction Forces

The reaction forces in the vertical direction underneath the saddle are listed for each of the load cases in the tables below. The saddles on the left and right are each supported at 4 points which correspond to the location of the hydraulic jacks which will be used in the final installation for support. In addition, the reaction forces on the cradle for load cases BA6 and BA8 when the cradle is in place are also listed. The reaction forces for the cradle are in the radial direction.

14	132,970	132,960

10. Deflections

The deflections at the module fiducial marks are listed in Appendix 11 for each of the load cases. The deflections at the cryostat support points are shown in the table below for the load cases BA1 and BA2 in which there are 64 modules in place and the cryostat load is transferred to the Barrel. These deflections are important because they indicate how the cryostat support points will move as the cryostat load is applied. This table shows that the cryostat supports are initially deflected outward from the beam line by 1.0mm in the X direction and downward by -.2mm in load case BA2 where 64 modules are in place but the cryostat load has not been transferred yet. When the cryostat load is transferred in load case BA1 the cryostat supports move further away from the beam line by 2.0mm in the X direction and move vertically .6mm in Y from their nominal position. Therefore, the interface between the cryostat and the cryostat supports on the barrel will have to accommodate deflections of approximately 1.0mm in both the X and Y directions.

Load Case	Front Cryostat Support	
	X(mm)	Y (mm)
BA1	2.0	0.6
BA2	1.0	-.2

* positive X values are deflections away from the center of the Barrel

11. Conclusions

This paper examined several load cases which occur during the assembly of the Barrel. The following are the main conclusions:

- The assembly is not stable until 18 modules are in place. Only then can the support cradle be removed.
- The forces between modules are nominal and are far less than the forces in the completed cylinder with 64 modules in place and the cryostat load applied.
- All of the stresses in the connections between modules are within acceptable limits.
- The interface between the cryostat supports and the cryostat move approximately 1.0 mm in the X and Y directions when the load of the cryostat is transferred to the Barrel.
