Gulf of Cadiz Anchovy

DEPM surveys

Cádiz - Vigo - Lisboa

Acronym: BOCADEVA

Study area: Gulf of Cádiz (**ICES Subdivision IXa South**)

Target species: *Engraulis encrasicolus* (Linnaeus, 1758)

Triennial survey

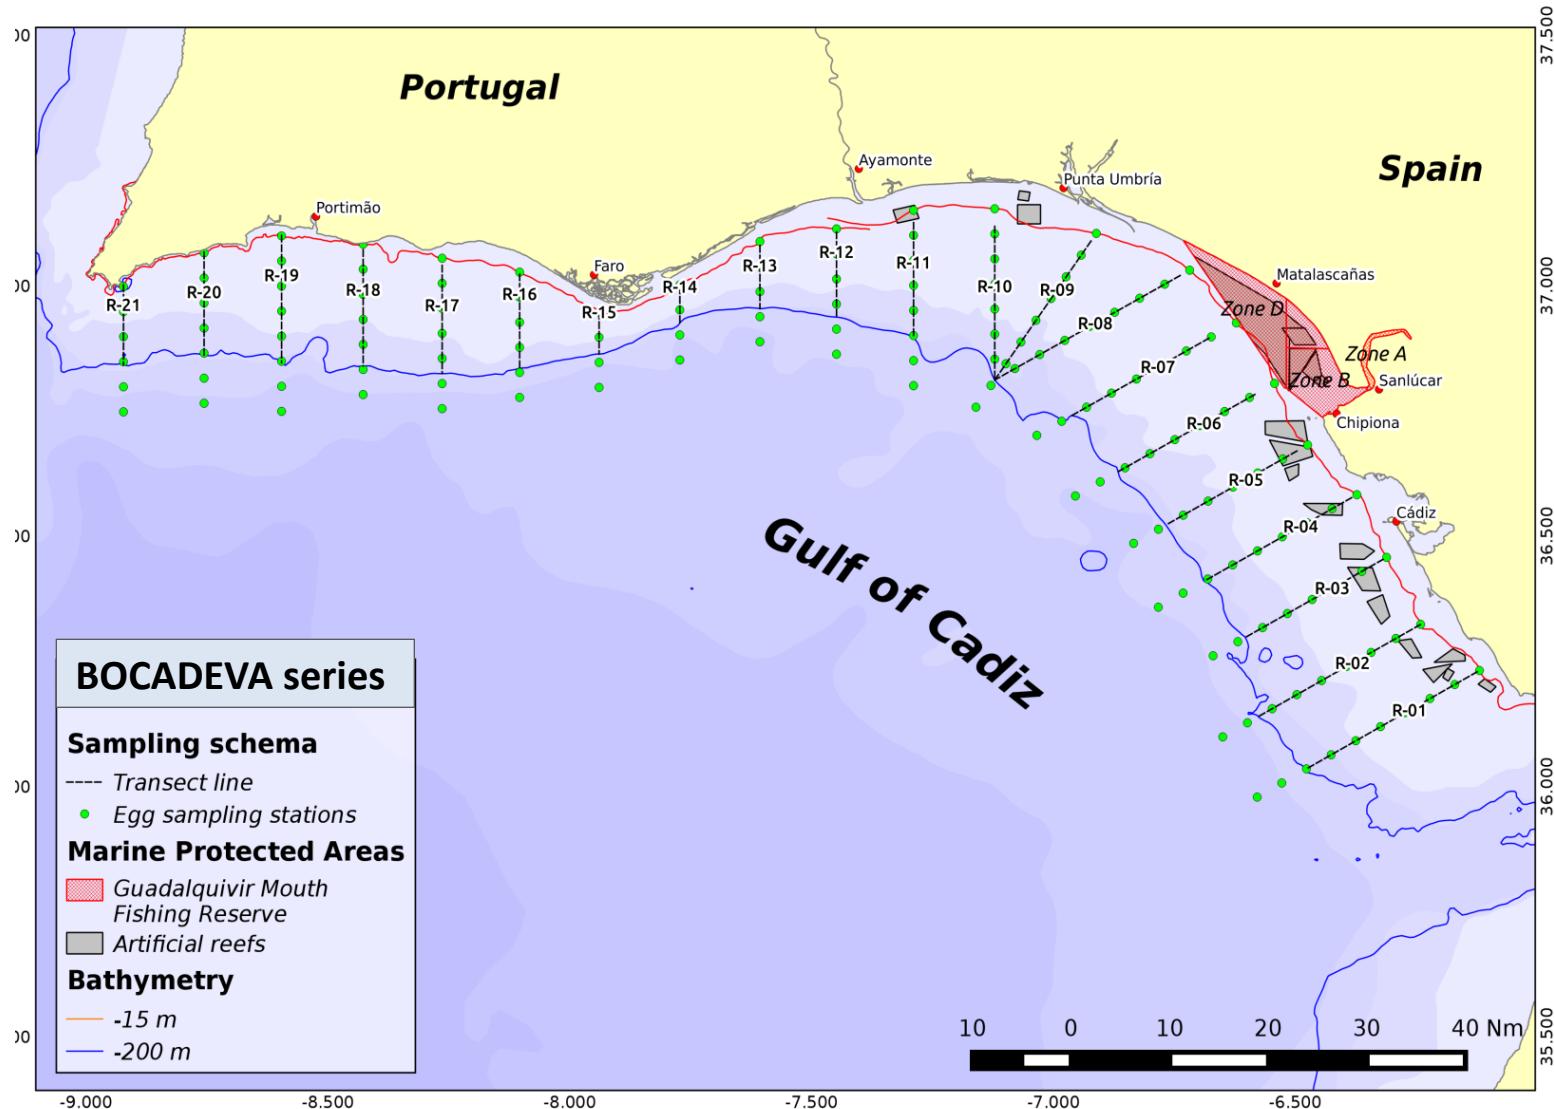

Main objective: estimation of the Gulf of Cadiz Anchovy SSB by the DEPM.

- Ichthyoplankton sampling, along a grid of parallel transects perpendicular to the coast, in order to obtain the spatial distribution of Anchovy eggs, the delimitation and calculation of the extension of the Anchovy spawning area, and the estimation of the Gulf of Cadiz Anchovy Daily Egg Production (P_0) and Total Egg Production (P_{total}).

- Adults sampling: Fishing hauls to obtain the adults spatial distribution as well as to obtain samples for the estimation of DEPM-based adult parameters: sex ratio (R), mean female weight (W), batch fecundity (F) and spawning fraction (S), within the mature component of the population.

The survey objectives also include both the obtaining of the size composition and biological characterization of other important commercial pelagic fish species in the area, and the characterization of the oceanographic and meteorological conditions in the study area during the survey.
