

Biscay AGL. An observatory for state of the art operational oceanography at IEO. Derived products, sensor networks and future developments.

IV ENCUENTRO DE OCEANOGRAFÍA FÍSICA ESPAÑOLA

Alicante 19th-22nd July 2016.

Daniel Cano

daniel.cano@st.ieo.es

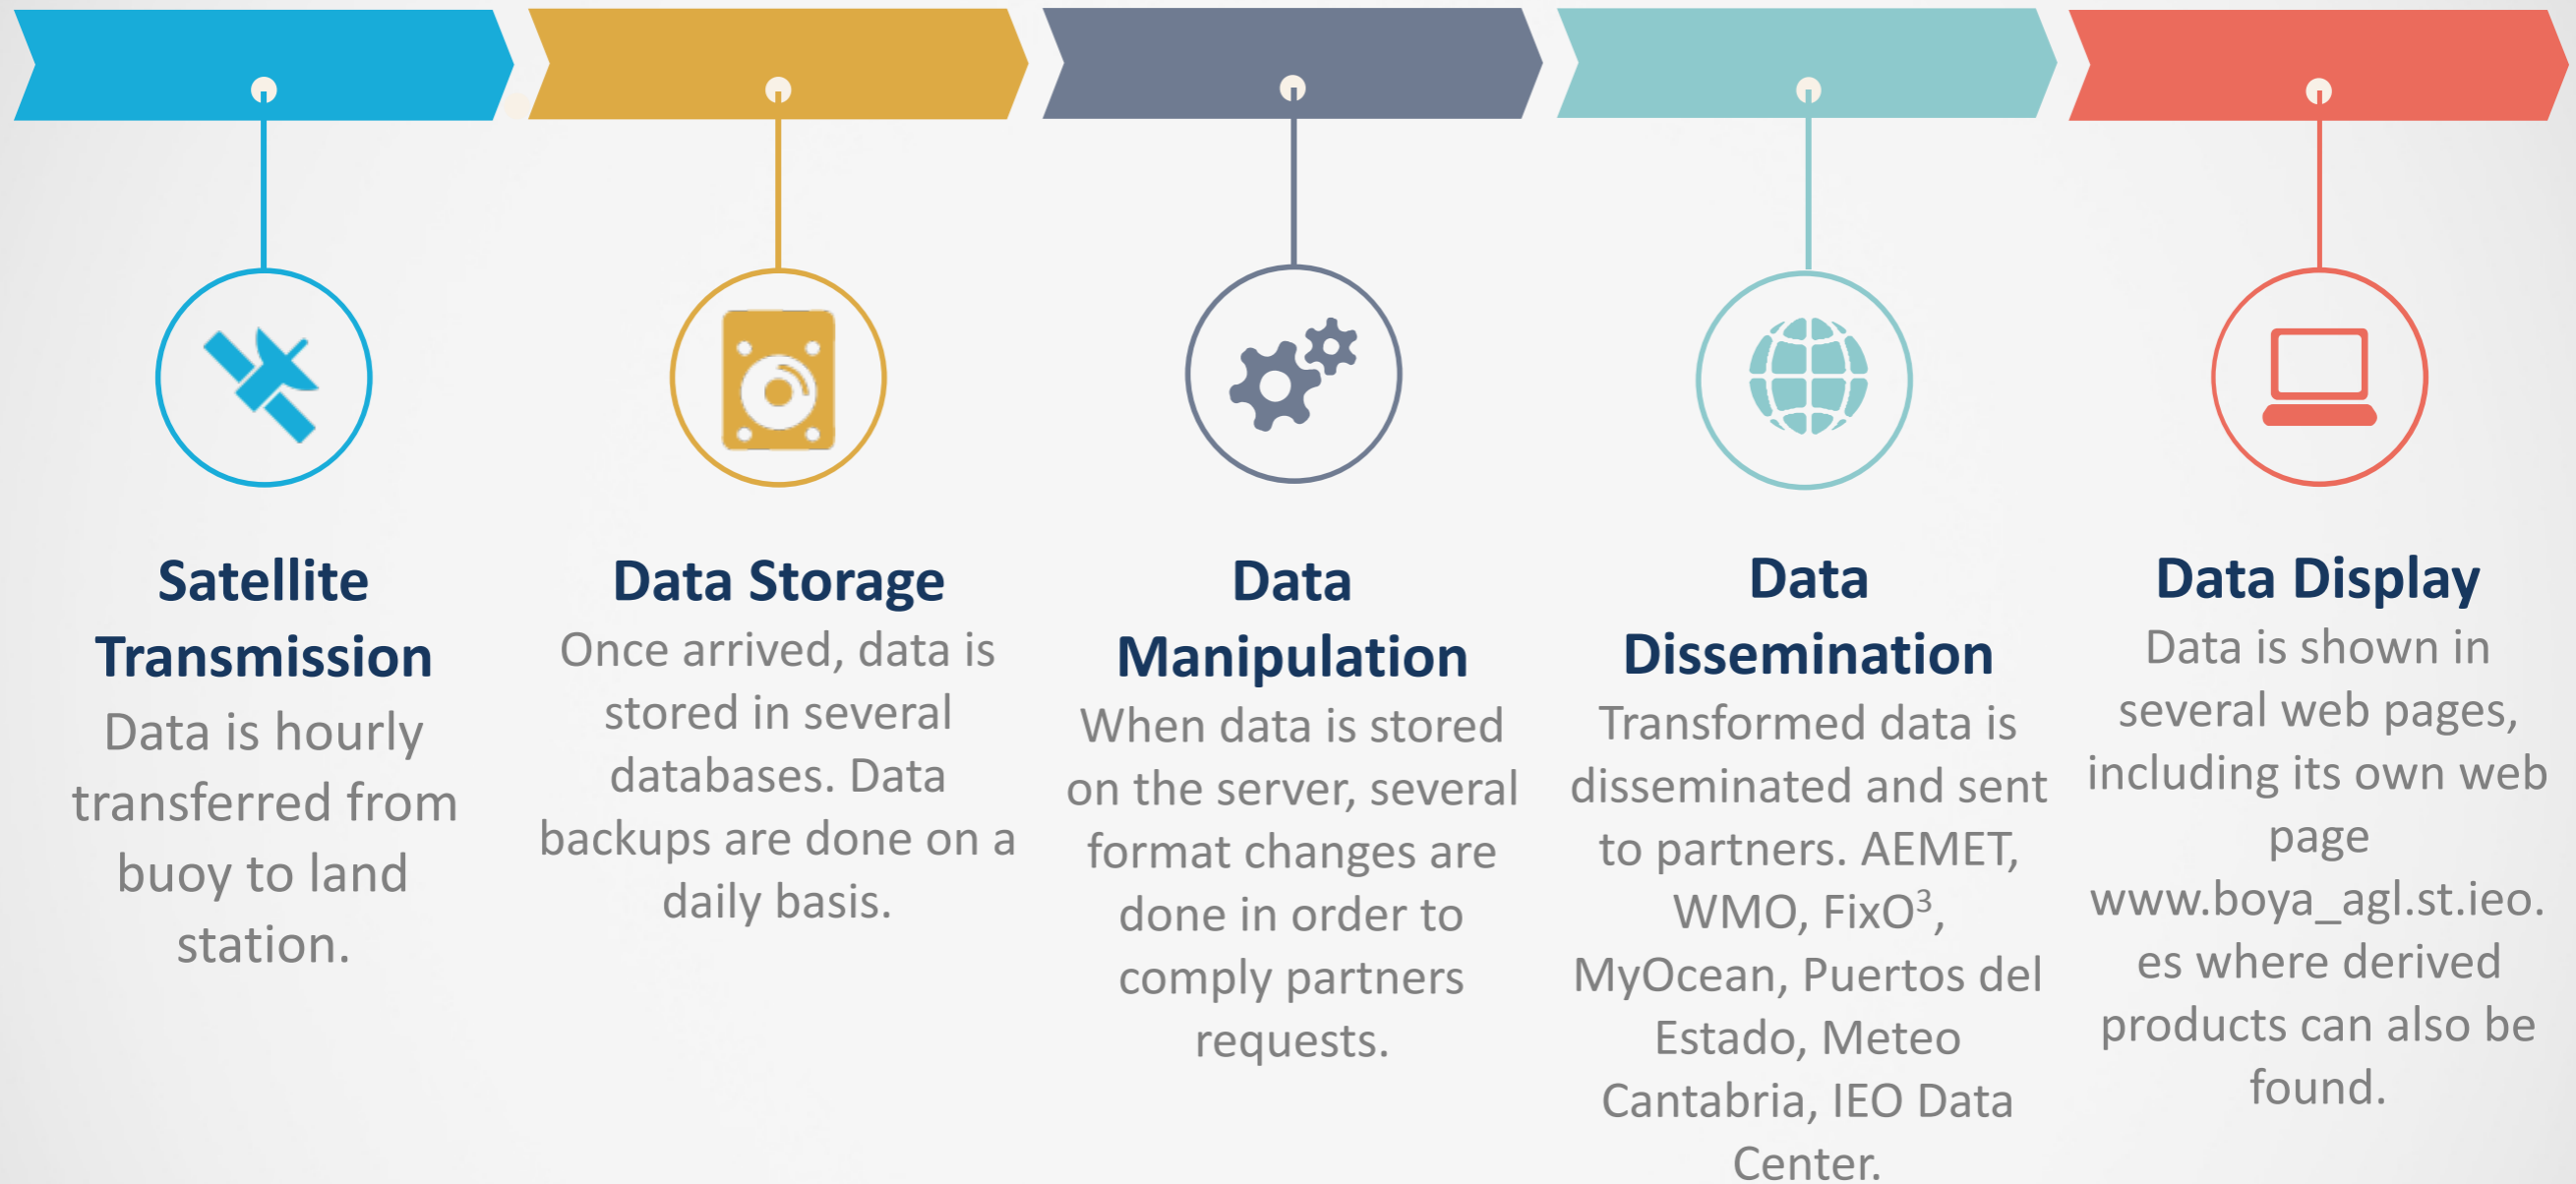

Augusto González de Linares Oceanometeorological buoy

Deployed June 2007 @ 22 miles north of Santander. Sensors installed include: humidity, wind, air temperature, waves, ADCP, Water Temperature, oxygen and chlorophyll

Research Vessel Ramón Margalef

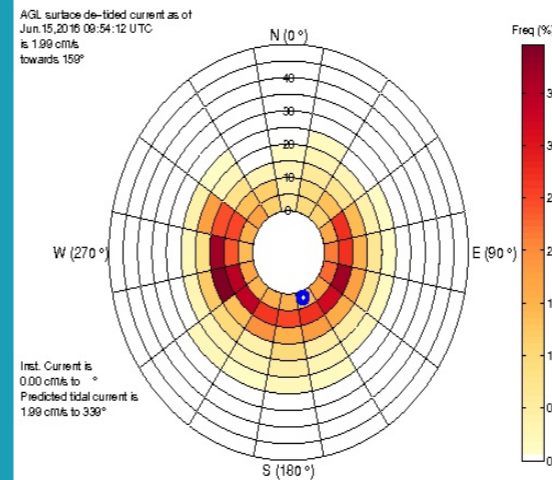

Manufactured in 2011 and with a total capacity of 23 people it has a length of 46.7m and a maximum beam of 10.5m. It is the vessel used for the monthly Santander standard section.

SSS Anomaly

Sea Surface Salinity anomaly. Calculated Hourly

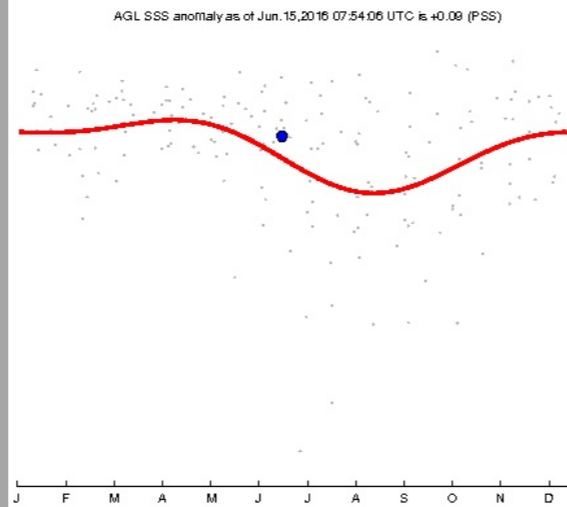

Sea State Characterization

Realtime wave significant height and period over a 2D chart of the monthly climatology.

SST Anomaly

Sea Surface Temperature anomaly. Calculated hourly.

Subinertial Currents

Surface detided currents at AGL Buoy. Calculated hourly

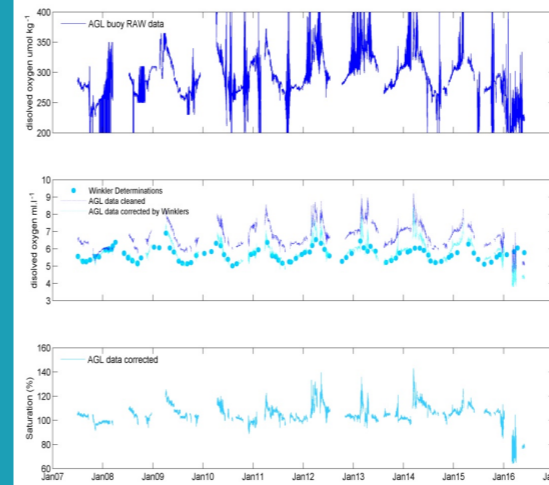

Delayed Time Products

Air-Sea Fresh Water Fluxes

Evaporation and evaporation-precipitation balance (e-p) at the AGL position

Corrected Chlorophyll

AGL Buoy data (Fluorescence) and laboratory determination (Cla mg/m³)

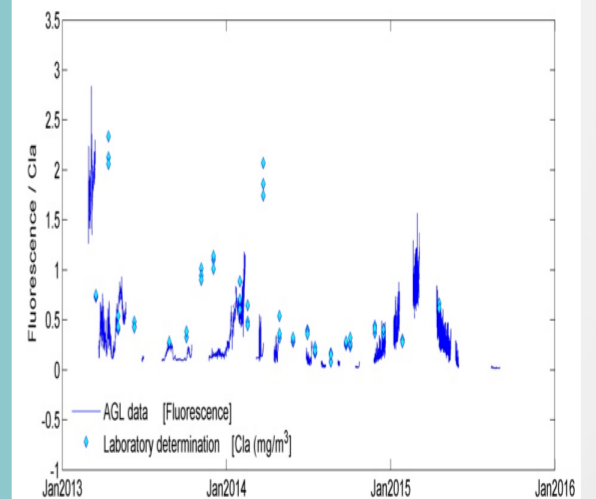

Air-Sea Heat Fluxes

Turbulent latent (HI) and sensible (Hs) heat losses from the ocean to the atmosphere

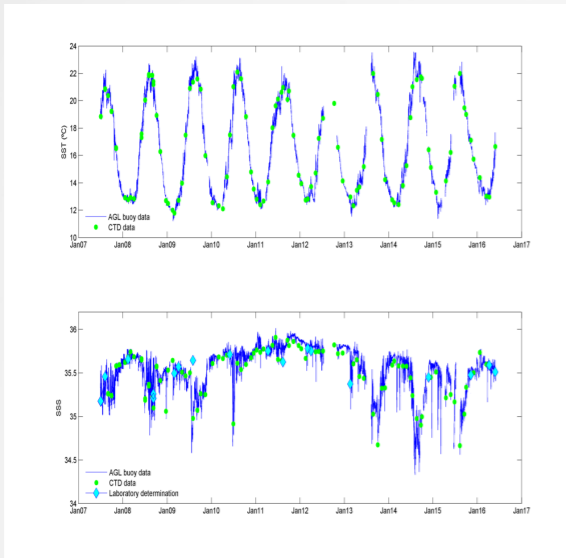

Corrected O₂

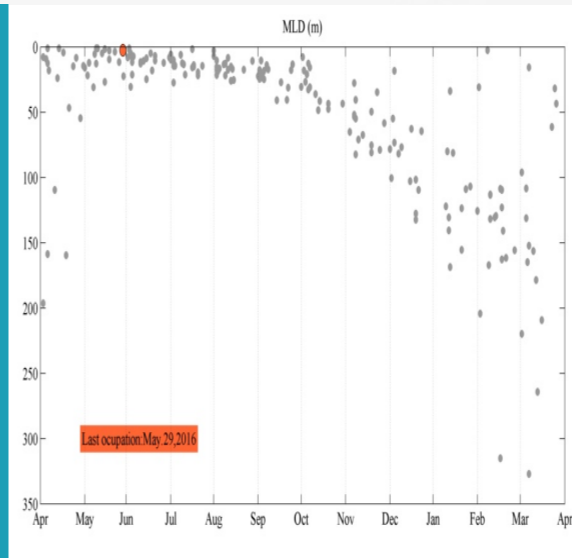

AGL buoy raw data, cleaned, corrected by winklers and finally corrected data.

Delayed Time Products

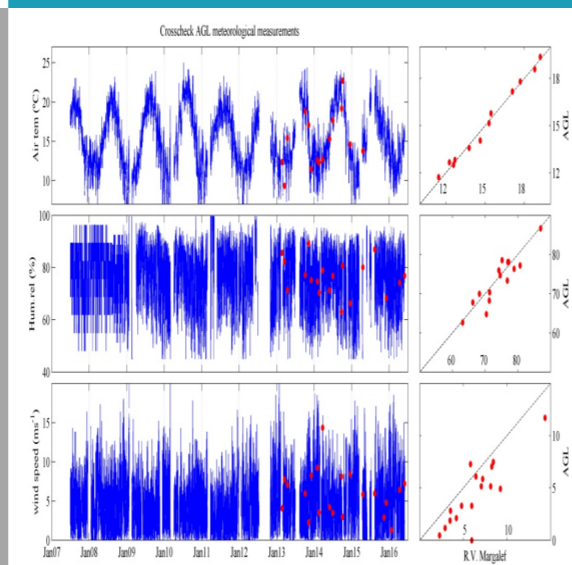

QC Meteorological Sensors
 Wind, air temperature and humidity data from the buoy monthly compared to R.V. Ramón Margalef

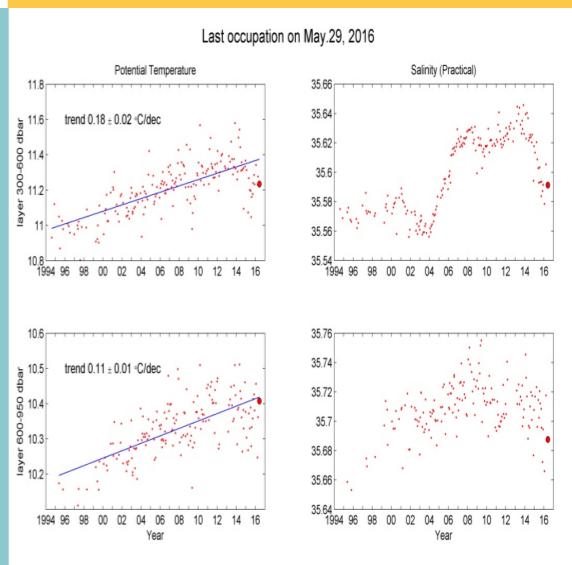

Monthly Heat Content
 Monthly heat content anomalies of different water masses.

TS Crosscheck
 Salinity crosscheck between AGL Buoy and CTD performed monthly. No correction required

Mixed Layer Depth Estimation
 Monthly determination of Mixed layer depth

Sensor Web Enablement

OVERVIEW

Sensor Web Enablement

OVERVIEW

- All sensors reporting position
- All connected to the web
- All with metadata registered
- All readable remotely
- Some controllable remotely

From OGC web page

“The OGC's Sensor Web Enablement (SWE) standards enable developers to make all types of sensors, transducers and sensor data repositories discoverable, accessible and useable via the Web.”

In few words

REALLY VERY ULTRA SUPER SIMPLIFIED SCHEMA

Any server containing any data

Might be dragons

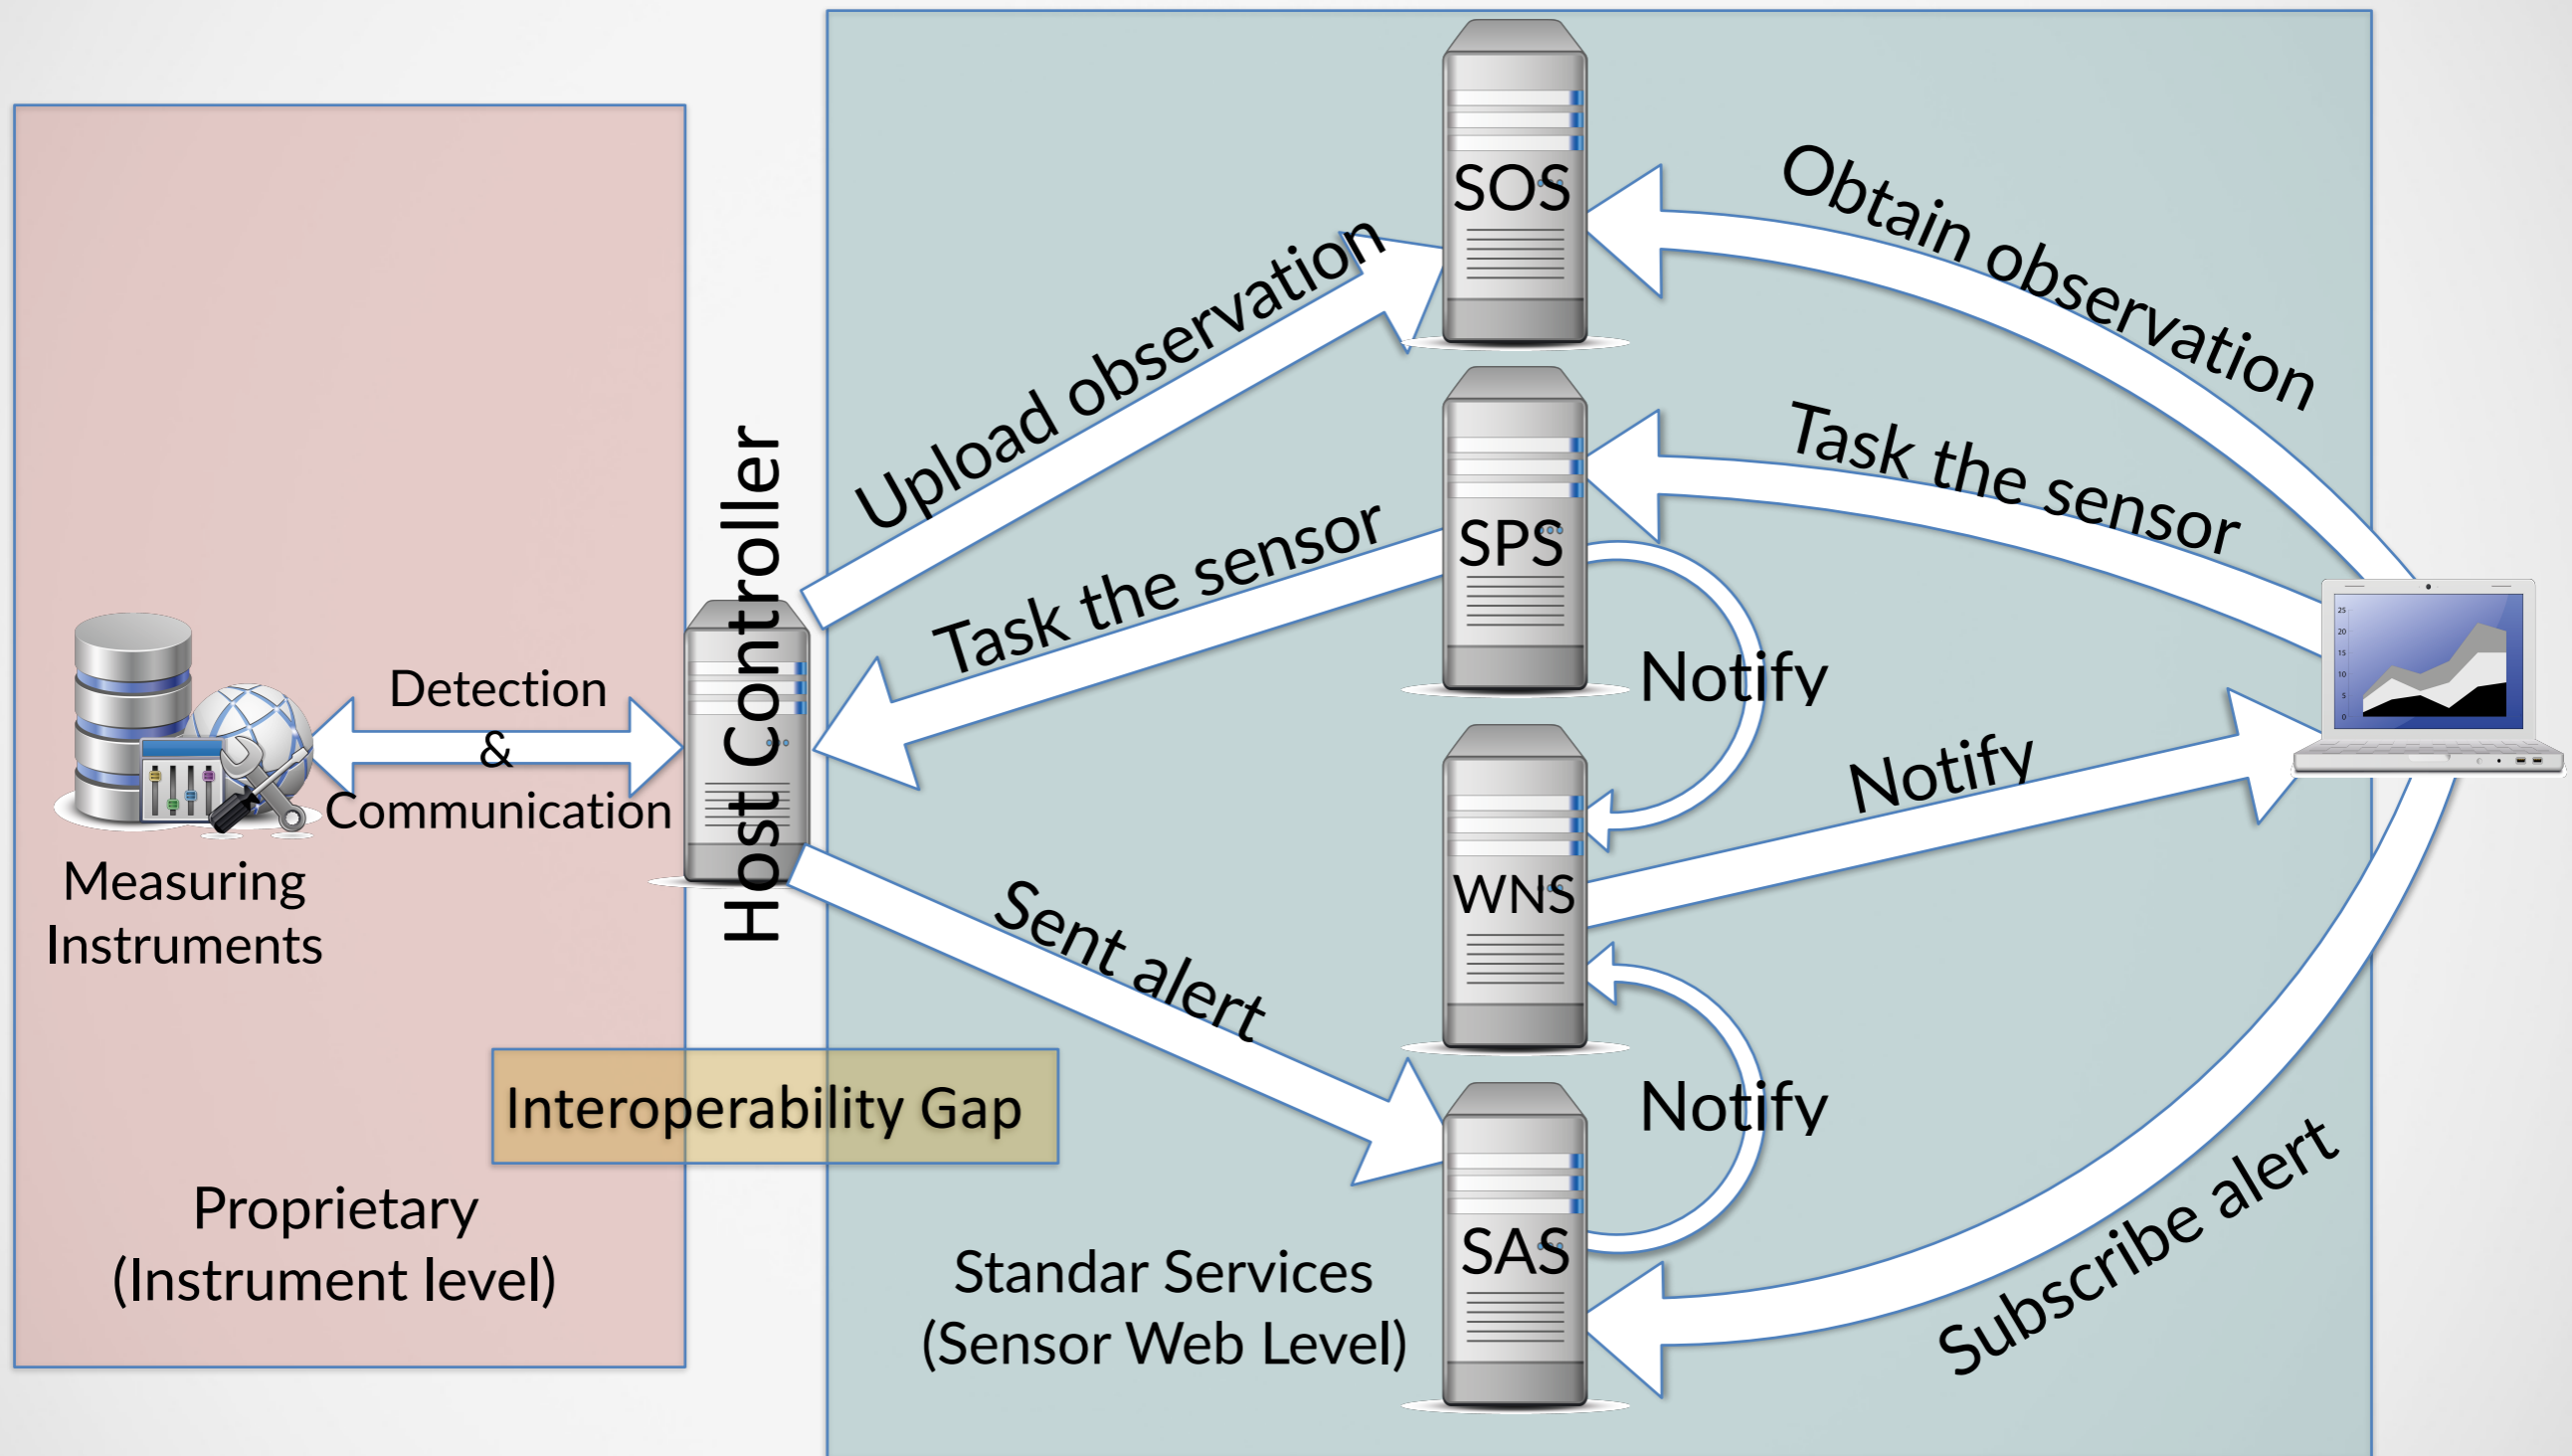

Client can connect to any SOS instance

SWE Framework

- *Observations & Measurements (O&M)* – The general models and XML encodings for observations and measurements.
- *PUCK Protocol Standard* – Defines a protocol to retrieve a SensorML description, sensor "driver" code, and other information from the device itself, thus enabling automatic sensor installation, configuration and operation.
- *Sensor Model Language (SensorML)* – Standard models and XML Schema for describing the processes within sensor and observation processing systems.
- *Sensor Observation Service (SOS)* – Open interface for a web service to obtain observations and sensor and platform descriptions from one or more sensors.
- *Sensor Planning Service (SPS)* – An open interface for a web service by which a client can 1) determine the feasibility of collecting data from one or more sensors or models and 2) submit collection requests.
- *SWE Common Data Model* – Defines low-level data models for exchanging sensor related data between nodes of the OGC[®] Sensor Web Enablement (SWE) framework.
- *SWE Service Model* – Defines data types for common use across OGC Sensor Web Enablement (SWE) services. Five of these packages define operation request and response types.

End to end

Simple example

“GetCapabilities”

- Max depth
- Measurement depth
- Measurement date
- Last calibration
- Calibration method
- Measurement location
- Instrument model

Client example

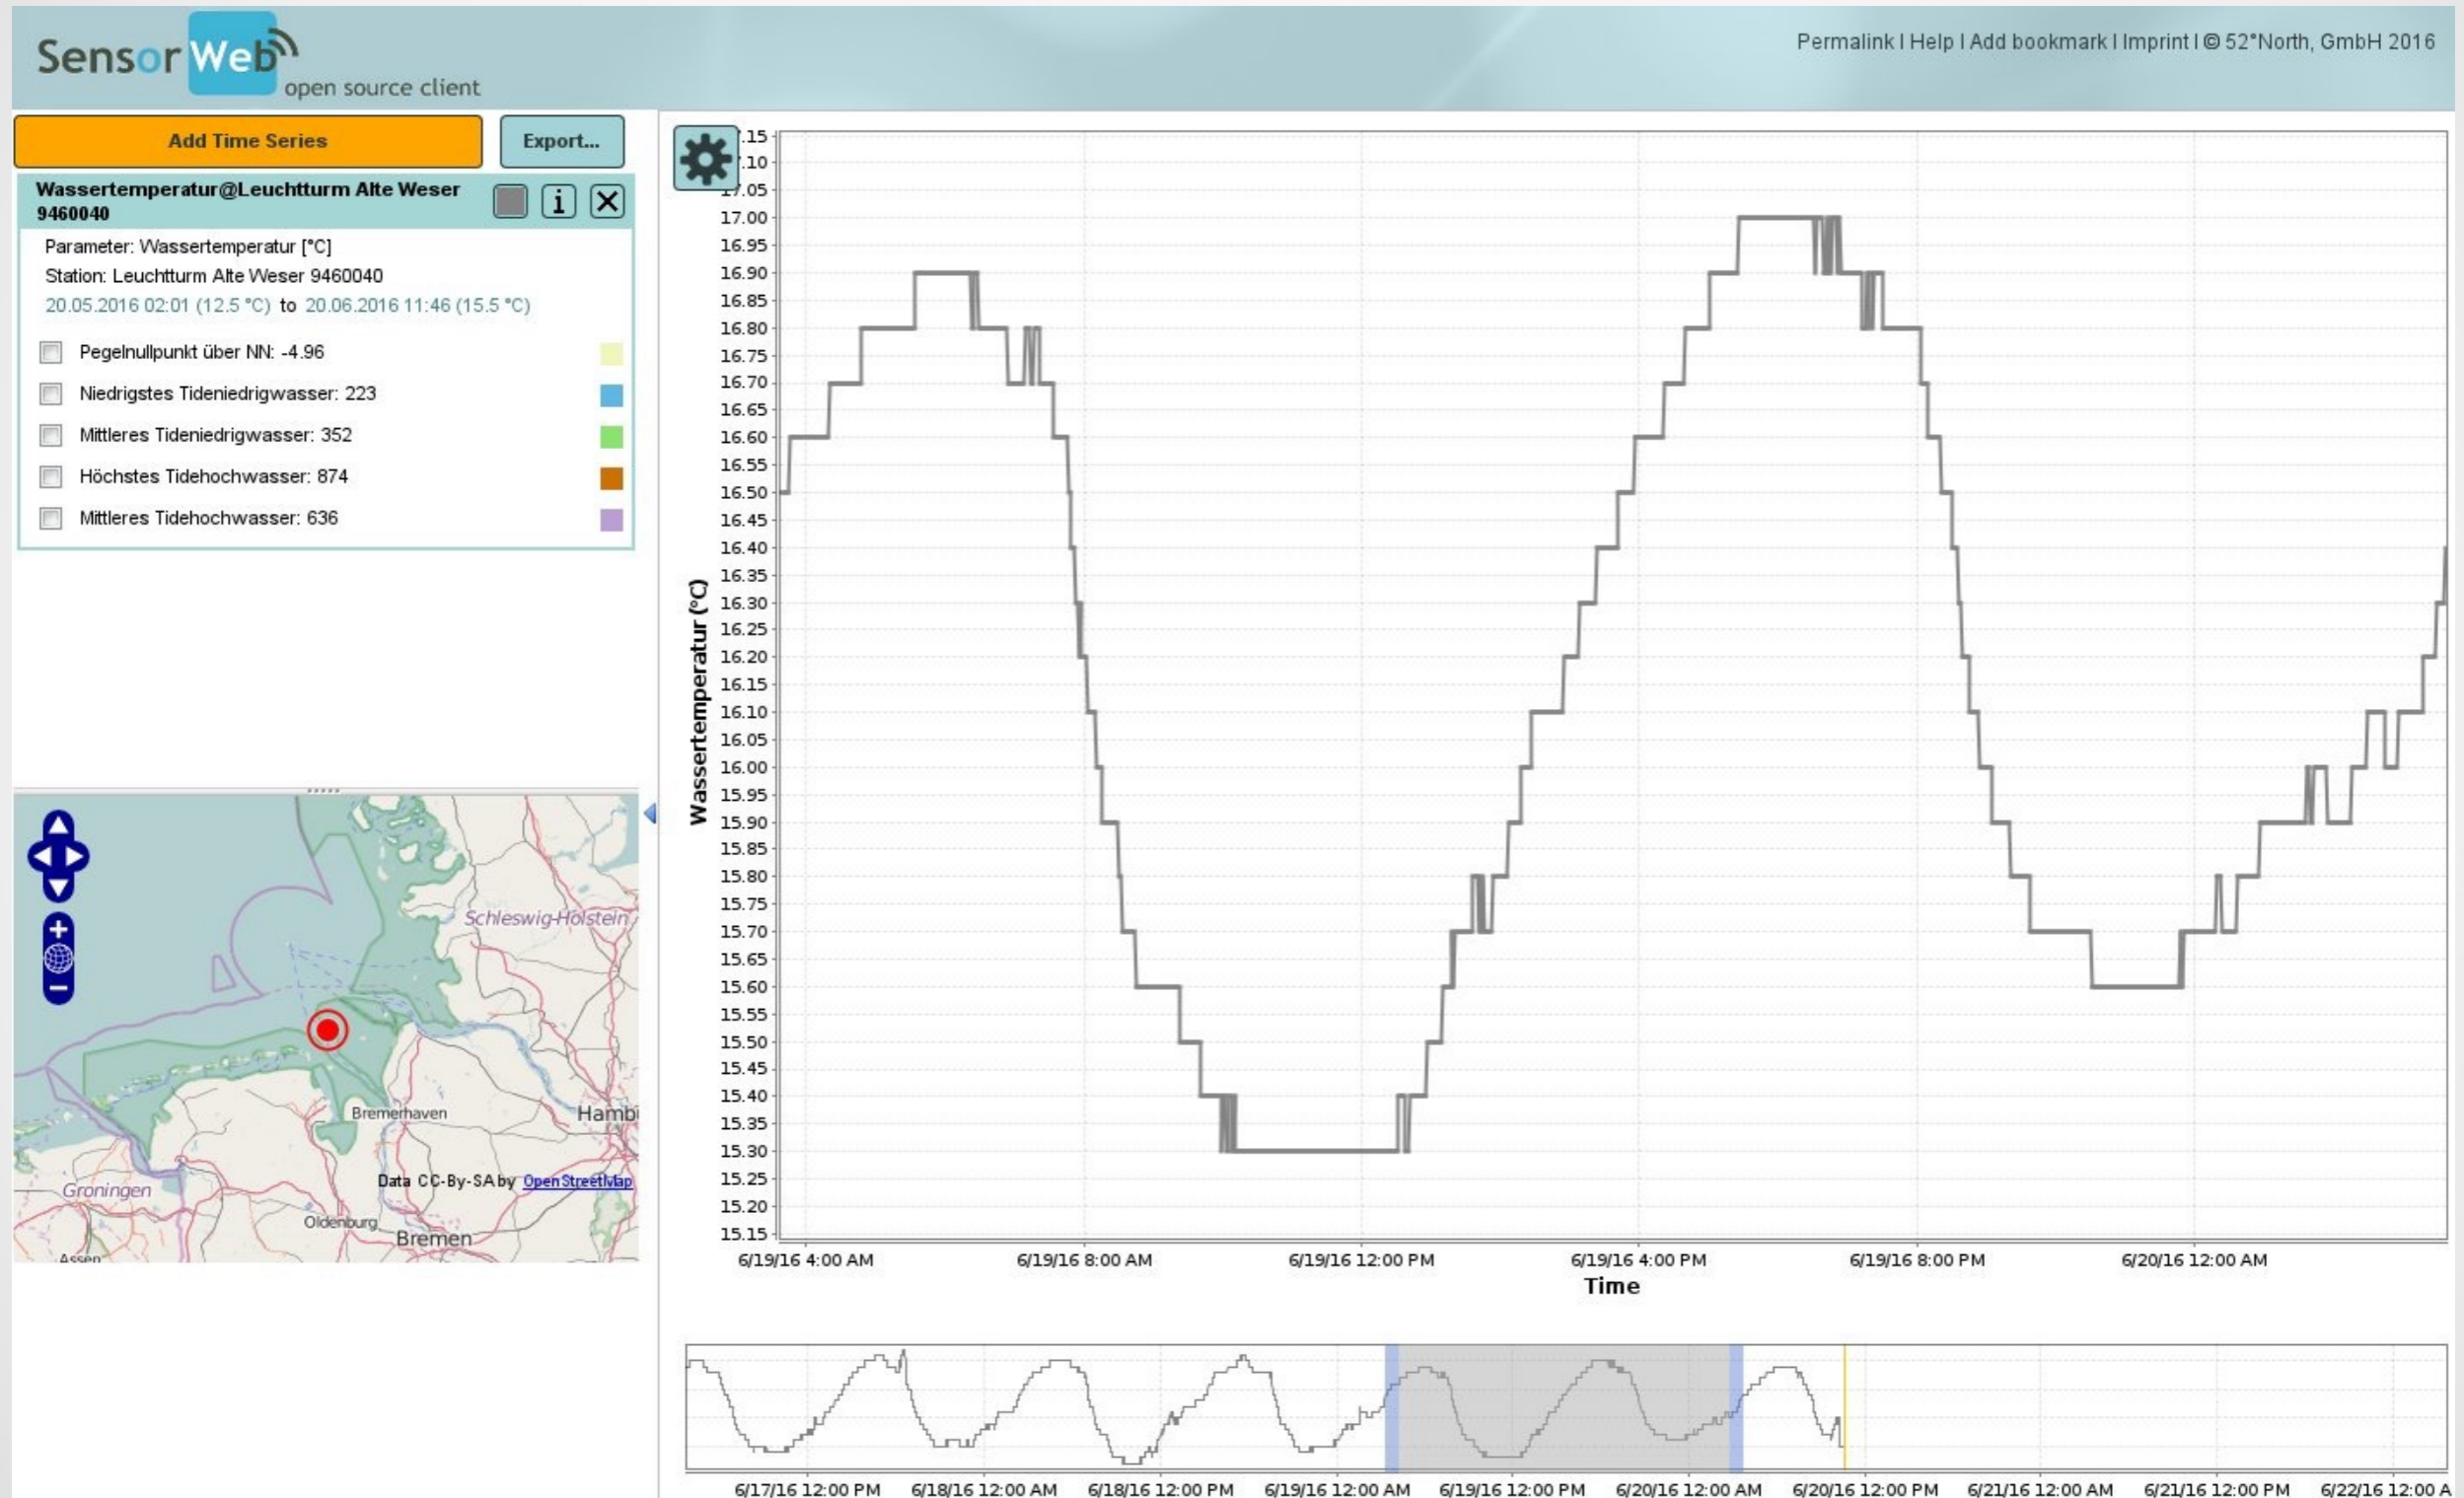

FROM 52 NORTH, A FIXO³ PARTNER

The screenshot shows the SensorWeb open source client interface. At the top, the logo "SensorWeb" is displayed with the tagline "open source client". Below the logo are three buttons: "Add Time Series" (highlighted in orange), "Export...", and a gear icon for settings. A search bar labeled "Search for time series" is positioned above a map of Europe. The map is densely populated with blue circular sensor icons, primarily concentrated in the North Sea and Baltic Sea regions. On the right side of the map, there is a "Choose data source" button and a "Dataprovider" dropdown menu. The dropdown menu is currently set to "PEGELONLINE" and lists various data types with radio button selection options: Abfluss, Chlorid, Durchfahrtshoehe, ElektrischeLeitfaehigkeit, Fließgeschwindigkeit, Luftdruck, Luftfeuchte, Lufttemperatur, ph_Wert, and Sauerstoffgehalt. The map includes labels for various countries and cities, such as Scotland, Edinburgh, United Kingdom, Ireland, Dublin, Sheffield, London, France, and Germany. A coordinate display at the bottom right of the map shows: "lon: -3.6072184617982797, Lat: 57.72726905826673 (EPSG:4326)".

Summary and future developments

Summary

- *Products from AGL Observatory are online and up to date.*
- *This includes both real time and delayed time.*
- *The OGC SWE standards are robust, well documented and it has a huge community behind.*
- *Can be used for any type of data.*
- *As a con it has a quite steep “learning” slope.*

Future developments

- *Populate the AGL Observatory with new sensors.*
- *Develop and test new sensor generation “SWE compliant” (via agreement with OBSEA)*
