

GLOOMY IMAGES OF *YELLOW* AND *ŻÓŁTY* IN A CORPUS-BASED COGNITIVE STUDY

EWA GIEROŃ-CZEP CZOR

PWSZ, Racibórz

ewa_g-cz@wp.pl

Abstract

The paper reports on a comparative corpus-based semantic analysis of one colour term as it is used in two languages: English *yellow* and Polish *żółty*. The investigation of central and peripheral meanings, based on analyses of corpus concordances draws upon the methodology and constructs of cognitive linguistics, such as prototype-based categories, domains, conceptual metonymy and metaphor. The first objective of this parallel study is to determine the prototypical reference points for *yellow* and *żółty*, followed by descriptions of those motivations and mechanisms of meaning extensions which lead to 'figurative' usages. The results are tentatively suggested in the form of a general network of related meanings, the entrenchments of which are established on the basis of frequencies attested in samples of 1,500 citations.

The outcomes confirm a conceptual proximity reflected in the semantics of these colour terms, which seems to be – perhaps surprisingly – incongruous with the popular association of *yellow/żółty* with the sun. As the evidence provided by the British National Corpus and the Polish Scientific Publishers' corpus (PWN) reveals, the central and peripheral readings are inspired by the imagery of autumnal and physiological changes, while the semantics of both *yellow* and *żółty* reflect the significant influence of cultural factors, unparalleled in the polysemies of the other five basic colour terms.

Keywords: colour terms, semantics, pragmatics, metaphorical extension

1. Rationale

My interest in *yellow* and *żółty* as cognitive categories arises out of a wider research project into the semantics of six colour terms in English and Polish (Gieróń-Czepczor 2008; 2010; forthcoming). These terms: *white*, *black*, *red*, *blue*, *yellow* and *green* - known as primary basic colour terms since the formulation of the thesis of universality of certain colour terms (Berlin & Kay, 1969 - are placed at the top of the implicational hierarchy which is believed to reflect evolutionary trends and their distribution in languages. According to the theory, *yellow* and its Polish counterpart *żółty* are ranked high among these six colours exhibiting the highest frequencies and salience in fully developed, i.e. VII stage (ibid.: 22f.), languages (see Fig.1).

Berlin & Kay (1969)	BNC (2008)	COCA (2008)	PELCRA corpus (2008)	PWN corpus (2008)
RED	RED	RED	CZERWONY	CZERWONY
GREEN/ YELLOW YELLOW /GREEN	GREEN BLUE	GREEN BROWN	ZIELONY SZARY	ZIELONY SZARY
BLUE	BROWN	BLUE	NIEBIESKI	ŻÓŁTY
BROWN	GREY/GRAY	GRAY/GREY	ŻÓŁTY	NIEBIESKI
GREY	YELLOW	YELLOW	BRAZOWY	BRAZOWY
ORANGE	PINK	ORANGE	RÓŻOWY	RÓŻOWY
PURPLE	ORANGE	PINK	POMARAŃCZOWY	POMARAŃCZOWY
PINK (in any order)	PURPLE	PURPLE	FIOLETOWY	FIOLETOWY

Tab. 2: The sequence of BCTs according to corpus frequencies (surnames omitted).

Previous quantitative analyses reveal that this BCT occupies a lower position in terms of corpus frequencies in both languages. In a study by Pawłowski (2006: 45) the distributive ranking of the Polish eleven BCTs in corpora exhibits the following sequence: *black, white, red, green, blue, grey, brown, yellow, pink, orange, violet*, in which *żółty* ('yellow') appears to be less frequent than terms for blue, grey and brown. Although the statistics for this Polish BCT are less striking elsewhere (see Tab. 2), relegating *żółty* to the seventh place on the basis of overall frequencies in the PELCRA corpus, and the sixth place in the PWN corpus, the question still remains: why are *yellow* and *żółty*, while referring to a highly distinctive and salient colour, so poorly represented in the two languages in question? Even in the realm of aesthetics "yellow never seems to have been regarded as a noble colour in the West until the end of the Middle Ages, and it is apparently still regarded as one of the least pleasurable of individual hues" (Burnham et al. 1963: 209-210 in Gage, 2006: 15). Can this averseness towards yellow be traced, and convincingly explained, on the basis of available linguistic data?

2. Method

In order to obtain a plausible explanation for this intriguing phenomenon of a significant deviation in the universal pattern of colour distribution in the lexicon, an insight into the semantics of *yellow* and *żółty* is indispensable. In spite of previous linguistic research into the semantics of these terms (Wierzbicka 1996: 317; Waszakowa 2003; Tokarski 2004; Stanulewicz 2006), a need for a more detailed study, combining both qualitative and quantitative approaches within a cognitive semantic framework, is highly justified. For this reason, the following analysis investigates: (a) instances of *yellow* and *żółty* in large samples (1,500 citations) extracted from electronic online corpora; (b) collocational patterns and other linguistic data in search of the prototypical entities, expected to motivate both central and peripheral meanings; (c) etymologies which might shed some light on the primary motivations and associations behind today's categories of *yellow* and *żółty*; (d) lexicographic material referring to natural objects and phenomena

as perceptual reference points for this and other colour terms; (e) frequencies of attested meanings of the investigated BCT in either language. This procedure is intended to provide a conceptual picture for the categories of *yellow* and *żółty*; one which is likely to account for the weak status of these colour terms in their languages.

3. Research

Colour terms cannot be analysed in isolation, whether from a perceptual, conceptual or cultural perspective. Accordingly, this section starts with a brief appraisal of the other five BCTs in English and Polish, with reference to their prototypes. Table 3 illustrates a rather consistent pattern of correlations between historical meanings, ‘best exemplars’ of respective colours as indicated by dictionaries, and corpus findings. With very few exceptions, the data obtained so far allow determination of the prototypical core for each respective category.

BASIC COLOUR TERM	HISTORICAL MEANING(S)	DICTIONARY DATA	CORPUS DATA (COLLOCATES)	PROTOTYPE(S) FOR THE CATEGORY
BLACK	dark; to burn, gleam	darkness/night, soot, coal, printing ink	night, black organic substances, black birds	NIGHT, BLACK ORGANIC SUBSTANCES
CZARNY	colour of coal; dark, gloomy, evil; dirty	coal, darkness/night, soot	black organic substances, black birds, night, ebony	BLACK ORGANIC SUBSTANCES, NIGHT
WHITE	to shine, to gleam, bright, white	snow, milk, salt egg white, bone	snow, sheet, paper, ghost, milk	SNOW, DAYLIGHT,
BIAŁY	white, light, shining	snow, milk	snow, flour, chalk	SNOW, DAYLIGHT
RED	red	(fresh) blood, fire, leaves in autumn, ripe fruits	blood, berries, fire,	BLOOD, FIRE
CZERWONY	of (the colour) of blood, (of the face) blushing	the first (or 7 th) colour in the rainbow	blood, beetroot, red wine,	BLOOD, FIRE
GREEN	to grow, to become green	grass, foliage	grass, emerald, leaves,	HERBAGE, LEAVES

BASIC COLOUR TERM	HISTORICAL MEANING(S)	DICTIONARY DATA	CORPUS DATA (COLLOCATES)	PROTOTYPE(S) FOR THE CATEGORY
ZIELONY	to shine; yellow, green, grey, blue	fresh grass, emerald	young grass, lawn, bottle glass, unripe fruits	HERBAGE, LEAVES
BLUE	light coloured, blue, blond, yellow	(clear) sky, (deep) sea	sky, sea, eyes, cornflowers	SKY, (SEA) WATER
NIEBIESKI	of the sky and heaven	(clear) sky blue flax flower	sky, cornflowers, sea	SKY, (WATER)

Tab. 3: Review of the prototypical exemplars and etymological data for the primary BCTs in English and Polish (Gieroń-Czepczor forthcoming).

The results presented in Table 4, which conclude my previous research (Gieroń-Czepczor (2008, 2010, forthcoming), have also been confirmed in recent literature by *inter alia* Niemeier, 1998, 2007; Peprnik 2005; Philip 2006; Pietrzak-Porwicz, 2006; Sarapik, 1997; Sassoon 1992; Stanulewicz 2006, 2007, 2009; Steinvall 2002; Tatoj 2006; Teodorowicz-Hellman 2003; Tokarski 2004; Tribushinina 2008; Vaňková, 2000; Verosub 1994; Waszakowa 2000a, 2000b, 2003a, 2003b, 2003c; Wierzbicka 1990, 1996. These clearly indicate that the other five primary BCTs are conceptually motivated by entities and phenomena which conform to common associations.

3.1 The conceptual core

The conceptual centre of a lexical unit, conveniently termed ‘the prototype’ (Heider 1972; Rosch 1975, 1978; Rosch and Mervis 1975; Lakoff 1987), is understood as “the basic reading”, “the center of semantic cohesion in the category” (Geeraerts, 2001: 3), characterized by “psychological salience, relative, frequency of use, interpretative advantageousness” (ibid.). Wierzbicka (1996: ch.10) defines the prototype as “phenomena prevalent and distinctive to the environment”, and with reference to *yellow* the author (ibid.: 317) suggests an explication which indicates the sun as the only salient natural entity central to our understanding of the category. This claim does not account for the explicit negative meanings that *yellow* and *żółty* exhibit. The prototype extended to “a psychological object or process” (Coleman & Kay, 1981: 43) or “a mental representation” (Ungerer & Schmid, 1996: 42) allows for inclusion of seasonal changes (Waszakowa 2003) and the process of ageing (Tokarski 2004) into the centre of the categories *yellow* and *żółty*.

3.1.1 Lexicographic evidence

A review of dictionary definitions, presented in Table 4, provides information on what is seen as the best exemplar of the colour. The range of entities indicated is, on the one hand, fairly wide (including *lemon*, *butter*, *yolk* and *gold* as the most salient referents). On the other hand, it does not indicate any object or process which might seem to motivate the usages of *yellow* and/or *żółty*; especially those based on metonymic and metaphorical mappings. Notably, *the sun* appears in one definition only, following *lemon* and *gold*.

English and American dictionaries	Natural prototypes
<i>Oxford Advanced Learner's Dictionary of Current English</i> (1974)	gold, yolk
<i>Webster's Encyclopedic Unabridged Dictionary of the English Language</i> (1989)	butter, lemon
<i>The American Heritage Dictionary</i> (1994)	ripe lemons, the hue of the visible spectrum between orange and green
<i>Longman Dictionary of Contemporary English</i> (2003)	butter, yolk
<i>Oxford English Dictionary</i> (no date)	gold, butter, yolk, flowers, the hue of the visible spectrum between orange and green
<i>Cambridge Advanced Learner's Dictionary</i> (2008)	lemon, gold, sun
<i>Merriam-Webster's Online Dictionary</i> (no date)	ripe lemons or sunflowers, the part of the spectrum lying between green and orange
Polish dictionaries	Natural prototypes
<i>Słownik języka polskiego</i> (1983)	the third colour in the rainbow, lemon
<i>Uniwersalny słownik języka polskiego PWN</i> (2003)	lemon, buterrcup, yolk

Tab. 4: Prototypes of *yellow* and *żółty* in dictionary definitions

3.1.2 Etymological data

Unlike *green*, the etymology of which clearly suggests associations with vegetation - (PIE **ghrē-* meant “to grow, to become green”), which conceptually shapes the semantic category of *green* - *yellow* and *żółty* derive from a shared proto Indo-European root **ghel-*, with the meaning ‘yellow, green’ (Harper 2001) or ‘yellow, green, gray, blue’ and ‘to shine’ (Pokorny, 1959: 429-434); a colour term itself even if one representing a wider reference, encompassing the quantitative (saturation) and qualitative (hue) dimensions of a stretch of the colour spectrum. As such, the original term does not

denote any object or phenomenon which might be responsible for the connotations that *yellow* and *żółty* reveal nowadays, although the ‘shiny’ quality plays a significant role in further analysis. This diachronic perspective, however, explains the conceptual closeness between *yellow/żółty* and *green/zielony* in their references to vegetation and unhealthy human complexion. Another fact, attested in the history of *żółty*, relates this colour term to gold; Proto-Slavonic *žlt* (or *žolt*) is cognate with *zloto* (Brückner 1998).

3.1.3 Collocational patterns

One method of identification of prototypical reference points in corpora is to investigate collocates in the similes *as yellow as*, *żółty jak* and *yellow/żółty with*, which are expected to indicate prototypical exemplars of yellowness and popular connotations of the investigated BCT. In samples of 1,500 citations for *yellow* in the BNC and *żółty* in the PWN corpus, the following results have been obtained:

- 44 similes (*as*) *yellow as* include: *butter, skin, bananas, sulphur, lights, cheese and terror*;
- 45 similes *żółty jak* also fail to indicate a prototypical entity. However, the repeated collocate *wosk* (‘wax’) seems to emphasise the negative connotations of *żółty* as the colour of skin characteristic of a sick or elderly person;
- 20 relevant citations for *yellow with* indicate the following collocates: *age* (10), *egg* (2), *saffron* (2), *autumn colours* (1), *bile* (1), *pollen* (1), *disease* (1) and *flowers* (1);
- Merely 5 instances of *żółty od* collocate with: *sulphur, dandelion, lights, silt and tiredness*.

Based on this evidence, it would seem that in the wide array of natural substances, fruit, flowers and negative associations with sickly skin, no single entity plays the role typically attributed to categorical prototypes. Most importantly, the sun is conspicuously absent in this material.

3.1.4 Where is the sun in the semantics of *yellow* and *żółty*?

The evidence for the prototypicality of the sun with reference to the categories of *yellow* and *żółty* is scarce; hard to defend unless an intuitive approach – espoused by Wierzbicka (1990, 1992, 1996) – is accepted. With a focus on corpus data based on varied, real-language material, insistence on the prototypicality of the sun is no longer plausible. The above-mentioned data appear to disprove those pre-existing intuitions which associate the cognitive categories of *yellow* and *żółty* with the sun as the prototype. However, this observation is not meant to reject the ‘sunny side’ of *yellow* altogether. The sun does appear in the semantics of *yellow/żółty*, yet extremely rarely and mostly indirectly. For example, the adjective *yellow* (in 2929 citations in the BNC) is frequently preceded by other adjectives which stress the luminosity of the colour (frequencies in brackets): *bright* (79), *luminous* (33), *white* (33), and *golden* (32). However, *yellow* as a collocate with the noun *sun*, has only 20 results in a 4 left and right collocates search in 3128 citations, in which only 7 are relevant with the colour as an

attribute of the noun. A similar search for *żółty* yields 3 instances in 2500 citations including *słońce* ('sun'). Moreover, it seems that *yellow/żółty* tend to describe weaker or filtered sunshine as in:

- (1) barwa słońca przy zachodzie jest żółta, złocista lub różowa (PWN)
"the colour of the sun is yellow, golden or pink at sunset";
- (2) the last sunset is orange and yellow, then shades of purple (BNC)
- (3) the yellow glow of the warm sun through your closed eyes.

White and *biały*, it can be argued, are more common in descriptions of full sunshine, as well as in those of sunlit places and objects. Perceptually, the quality of the yellow hue can be associated with sunshine, as in *sloneczna żółć* ('sunny yellow') and *ciepła żółć* ('warm yellow') which are consistent with intuitively positive associations of the colour with the sun. They are, nevertheless, unattested in the available corpus data, and not productive in phraseological units based on 'sunny' connotations.

Moreover, linguistic material offered by the corpora tends to suggest negative associations that indirectly link *yellow* and *żółty* with the sun. The sun might be seen as degenerative, as in collocations of *yellow* and *żółty* with nouns denoting plants, paper and cloth. Yellowed grass and leaves, like the pale yellowish skin of the elderly and sick, inevitably evoke negative associations with the passing of time and death, hence *sickly yellow* in descriptions of eyes and complexion attested in the concordance for yellow in the BNC, and its equivalent, *chorobliwie żółty*, in the PWN sample.

Therefore, the sun, even if present in the concept of *yellow/żółty*, evokes ambivalent connotations, as previously noted by Waszakowa (2003: 110). On the basis of a study of colour terms in poetry, Tokarski (2004) notes the predominance of negative associations in the usages of *żółty*, which – as he claims – arise from the image of autumnal changes in nature. These suggestions, more convincing than those based on popular associations, and combined with the qualitative and quantitative analyses below, confirm the problematic status of the sun within the categories of *yellow* and *żółty*.

4. Quantitative data and discussion

The following is a summary of an investigation into concordance data for adjectival forms of *yellow* in the British National Corpus, and *żółty* in the PWN Korpus Języka Polskiego. A manual analysis of the senses of the BCT in question was based on samples of 1,500 citations extracted from corpora. With a few exceptions, each sample provided enough contextual evidence to enable a reliable determination of meanings, whose frequencies are presented in Table 5.

Literal, metonymic and metaphorical senses of <i>yellow</i> and <i>żółty</i> in 1,500 corpus citations	BNC sample	PWN sample
NATURALLY YELLOW, ORANGE, BROWN(ISH) etc	↓	↓
> WILDLIFE AND ENVIRONMENTAL ELEMENTS	363	132
> OF HUMAN SKIN, RACE	7	27
> OF HAIR, FUR	2	4

Literal, metonymic and metaphorical senses of <i>yellow</i> and <i>żółty</i> in 1,500 corpus citations	BNC sample	PWN sample
> OF EYES	7	3
> OF EXCRETION, DISCHARGE, PUS, INFECTION	1	5
> OF FAT AND GREASE	1	4

PERTAINING TO A POLITICAL PARTY	5	3
COLOUR OF ATTENTION	9	2
> CAUTION, WARNING	208	124
> SENSATIONAL	2	0

Tab. 5: Meanings of *yellow* and *żółty* in the BNC and PWN Korpus concordances.

The quantitative results are represented in the form of a graph (Fig. 2), with related meanings partly subsumed under joint headings, for easier comparison of frequencies within one language and direct cross-linguistic comparison.

Fig.2: The occurrence of respective senses of *yellow* and *żółty* in corpus samples of 1,500 citations.

A significant majority of uses of both *yellow* and *żółty* can be traced to their referential function as a colour term. In this respect either term collocates frequently with nouns denoting a wide range of natural entities: flowers, birds, vegetables, cattle, rock and stone, fruit, leaves, grass, and sand. These collocations suggest *yellow* and *żółty* in their literal usages refer to a fairly ample stretch of the colour spectrum, and – via the metonymic mapping known as generalization – signify shades ranging between green and brownish. No single object or natural kind dominates in the frequencies attested, which corroborates the assumption that the prototype for the categories of *yellow* and *żółty* cannot be found among distinctive environmental entities.

Yellow, alongside red, belongs to the most conspicuous of colours, whether natural or artificial:

(4) the dried-up river bed is ablaze with yellow and pink stonecrop.

(5) Some retailers use distinctive packaging for their own brands, e.g. one supermarket chain packaged everything in bright yellow.

This characteristic makes yellow pervasive in signs and signals. While neutral in its semiotic function (neither red, i.e. “stop”, nor green, i.e. “go”) yellow does stand out perceptually and, as such, is suitable for indicating limitations, warnings or - more rarely

– danger. Yellow cards/*żółte kartki*, yellow traffic lights, yellow flags and double yellow lines are conventional enough to be further exploited in figurative usage:

(6) “Yellow card” for Tories over ticket touts laws

(7) ... od kilku lat Europa stoi na żółtym świetle ...

“For several years Europe has been standing at the yellow light...”

(8) Double yellow lines trap jailbird after 14 years on the run.

On the whole, yellow in its signaling function, as well as in its metonymic and metaphorical extensions, can be seen as fairly negative, evoking connotations of arrest or interruption.

With reference to the yellowish colour of human skin in racial contexts, *yellow* and *żółty* tend to be metonymically applied in a depreciatory, non-neutral way, unlike *black/czarny* and *white/biały*. English and Polish reflect a shared fear of an Asiatic invasion - either military or economic - as in the well-entrenched phrases: *żółta dżuma* (‘yellow plague’) and *yellow peril*. The latter, although believed to have been coined by William II of Germany (Hunter 1989), is deeply rooted in the image of the yellow race as a threat:

(9) ...zaleje nas żółta rasa.

(‘The yellow race will flood us’)

The readings of ‘faded’ and ‘yellowed’ occupy an important place in the semantics of the BCT in both languages. As an indication of age, disease or poor hygiene, *yellow* and *żółty* are fraught with overtly negative connotations which link the physical state with emotional misery:

(4) ... wyschłem duszą na żółty szkielet ... (PWN)

“... my soul withered into a yellow skeleton ...”

(5) ... wychudzony i żółty od nieprzespanych nocy. (PWN)

“...emaciated and yellow with sleepless nights.”

(6) Frankenstein's creation was hideous. He had yellow skin, watery eyes, black hair ... (BNC)

Further usage of yellow as ‘contemptible’ occurs in *yellow dog contract*, which – although attested in modern English dictionaries – has not been attested in the corpus material. An interpretation for the presence of *yellow* in the phrase may refer to the colour of the canine coat which, if yellow, indicates a mixed breed dog; cowardly and despised (Hendrickson 2008: 909):

The yellow dog, generally considered to be a cowardly common cur or mongrel, has long been a symbol of utter worthlessness in America. The term *yellow dog* has been used in expressions of contempt since at least 1833, when it is first so recorded, and toward the late 19th century it began to be heard in the term *yellow-dog contract*.

Morphologically unrelated, yet conceptually motivated by negative associations with fading, words like *withering* (‘scornful’, ‘contemptuous’, ‘humiliating’) and *off-colour* stand in clear contrast to adjectives denoting a truly sunny disposition, referred to as ‘cheerful’, ‘bright’ and ‘animated.’ This strand of linguistic evidence provides one more argument against any positive motivation of the sun for *yellow* and *żółty* viewed as conceptual constructs.

Moreover, when applied with reference to light or lights, both terms are not – as might be expected - typically found in collocations with the sun. Instead, each term

denotes the quality of celestial objects, as in “świecił żółty Jowisz”, PWN (“the yellow Jupiter shone”) or the light shed by weak sources:

- (7) ... the storm lantern threw its uneven yellow light (BNC),
 whereas full daylight or bright sunshine are described by terms implying luminosity and intensity, e.g. *golden*, *złoty* (*złocisty*, *złotawy*), *white* and *biały* (‘white’).

The previously listed conceptual mappings involving *yellow* and *żółty* are mainly pure metonymies, if conceptual blends such as *yellow peril* are excluded. As reference sources and corpus data indicate, metaphorical mappings in the usage of *yellow* result in solely negative meanings, such as: ‘emanating feeling of jealousy, anger’ and ‘craven, cowardly’. *Merriam-Webster Dictionary Online* lists the following adjectives as synonymous with *yellow*: *chicken*, *chickenhearted*, *chicken-livered*, *craven*, *dastardly*, *gutless*, *lily-livered*, *milk-livered* [archaic], *poltroon*, *pusillanimous*, *recreant*, *spineless*, *unheroic*, *cowardly*. All these are explicitly pejorative and consistent with the negative overtones present in *yellow-bellied*, *yellow coward* and *yellow streak*. The source of the underlying metaphor - or, as some might argue, SYMPTOM FOR ITS CAUSE metonymy - is the Theory of Four Humours, present in European culture since antiquity, further elaborated by Galen in the Middle Ages, and immensely popular in medicinal practice throughout the centuries. According to the doctrine, an excess of yellow bile in the human body accounts for an inclination towards anger. Although rejected by modern medicine, it permeates what is known as *folk medicine*, and - more importantly - still has an immense cultural reach, being productive in the interpretation of human nature.

The same motivation, without clear evidence in the form of well-established phraseology incorporating *żółty*, is present in the morphological (and conceptual) correlation between bile and the yellow colour: *żółć*, an uncountable feminine noun, signifies both of them. As etymological data suggest, *żółć* with the meaning ‘bile’ is an instance of metonymy, mapping the colouring onto the substance and further onto its (negative) properties and the symptoms evoked. Thus, due to a culture-induced conceptual shift, *żółć* is used within the domain of emotions with reference to an exhibition of distress or reproach:

- (8) – Defilada? – nappełniła słowo żółcią. – Za niecałą godzinę przed tym pomnikiem, co go nikt nie chce ...
 “– A parade? – she filled the word with bile. – In less than an hour in front of the monument that nobody wants ...”

Like *red* used metonymically for blood, *żółć* retains the ontological property of the entity from the source domain. Therefore, the state of irascibility is pictured as an abundance or overflow of the liquid, whereas its release helps one regain an emotional balance:

- (9) W miarę odpływu żółci następowało rozjaśnienie umysłu i pamięci.
 “As the bile receded, clarity of the mind and memory came”.
 The usages of *żółć* attested in the PWN sample reveal its synaesthetic nature: the term evokes a complexity of associations with bile; its colour and taste, correlating yellowness (domain of vision) with bitterness (domain of taste):
- (10) Na zasłonie żółciło się gorzko palące słońce
 “The bitterly glaring sun(shine) yellowed the curtain”.
 Bitterness as an emotional state rendered by the noun *żółć* is fairly frequent in Polish:
- (11) Mrok i żółć chwil bieżących ...

“The gloom and bitterness of the current moments ...”

- (12) Po bezludnych wąskich trotuarach przemykali gdzieś tam samotni żółci przechodnie.

“Lonely *yellow* passers-by were scurrying here and there along deserted narrow pavements”.

5. Conclusions

Colour terms do not have a purely referential role; they are used in order to express “a cultural unit or concept.” (Eco 1985: 160). The category of *yellow*, unlike the other primary BCTs, is not shaped by the primeval fear of natural phenomena such as the dark (*black*) or fire (*red*). Nor is it influenced by the imagery of a distinctive entity bearing a colour, as is the case with the sky, water (*blue*) and snow (*white*). The metaphorical status of *yellow* is the product of a complex belief in the special role played by a bodily substance upon the emotional constitution of humans; a belief widely-acknowledged and deeply rooted in European culture since medieval times. Its role cannot be overestimated: it has caused yellow to become synonymous with emotional imbalance, jealousy, cowardice and treachery. The concept, frequently fostered by aesthetic symbolism, has left negative connotations in culturally shaped perceptions of yellow in both Germanic and Slavonic languages.

Categorical structures of *yellow* and *żółty* seem to centre around blurred or weak prototypes, among which the role of the sun can easily be challenged, resulting in impoverished patterns of meaning extensions, all of which bear negative connotations. The basic imagery for *yellow* and *żółty* in nature is that of fading, drying, withering and sickness. Metaphorical usages do not go beyond negative evaluative connotations of treachery and cowardice. The historically attested shiny quality of **-ghel* seems to have been lost by *yellow* and *żółty* in favour of adjectives related to words for gold: *golden*, *złoty*, *złocisty* and *złotawy*.
