Hydrographic Data Processing on a Robust, Network-Coupled Parallel Cluster

Rohit Venugopal & Brian Calder

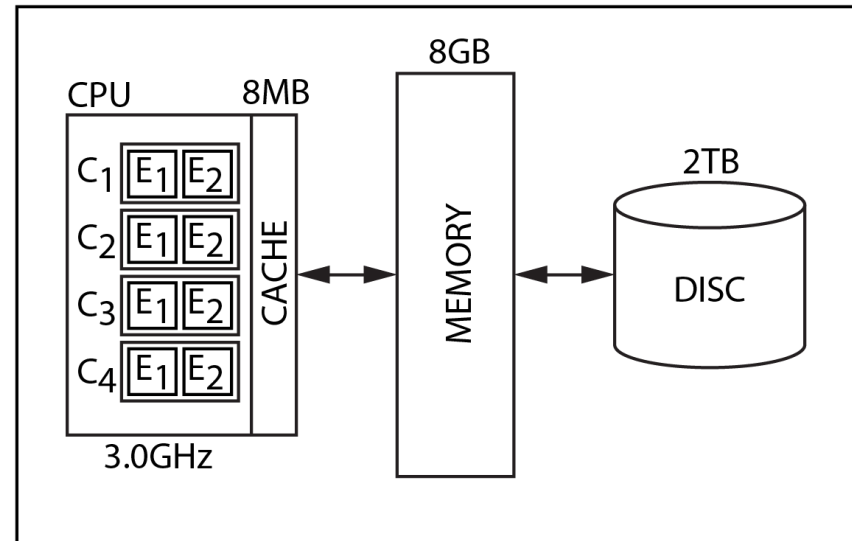

Center for Coastal and Ocean Mapping and NOAA/UNH Joint Hydrographic Center
University of New Hampshire, Chase Ocean Engineering Lab, Durham NH 03824, USA

COMPUTER BOUNDARY

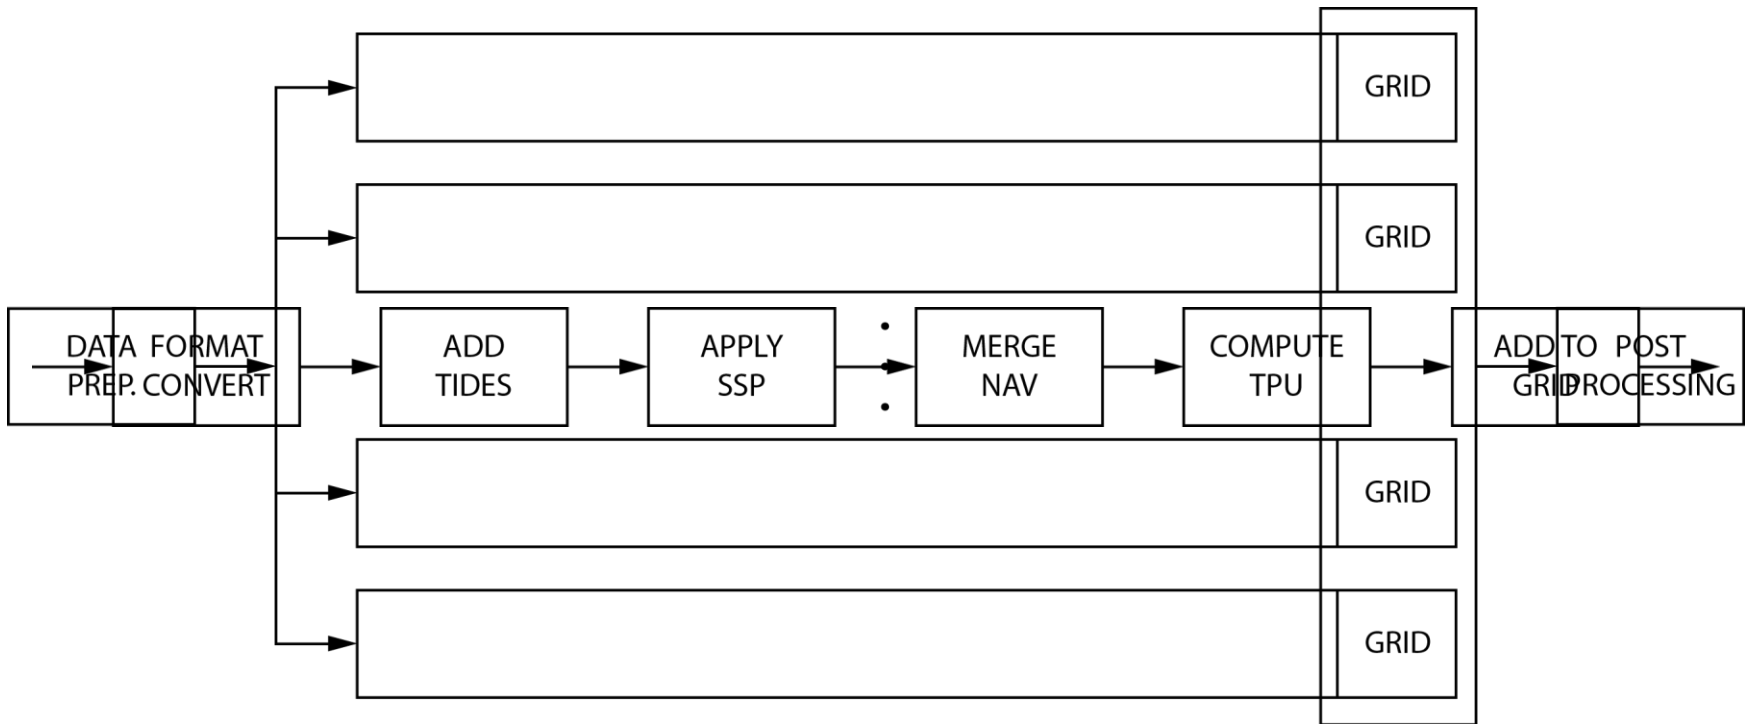

ca. 2000-2001

COMPUTER BOUNDARY

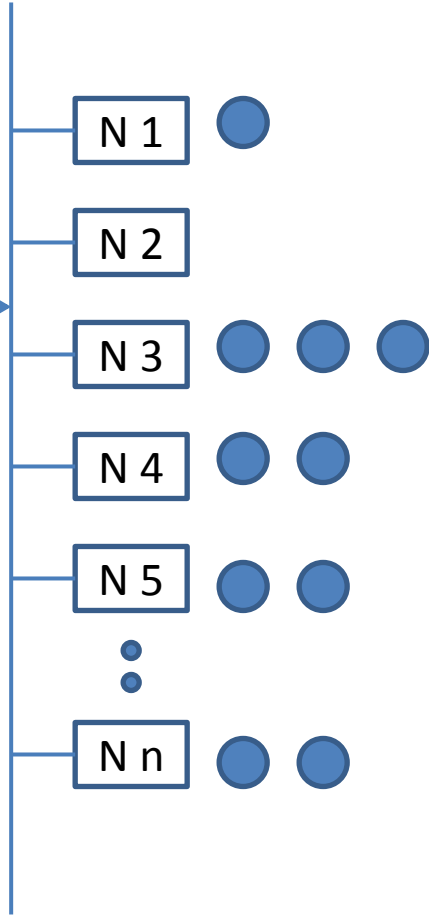

ca. 2011-2012

Task Queue

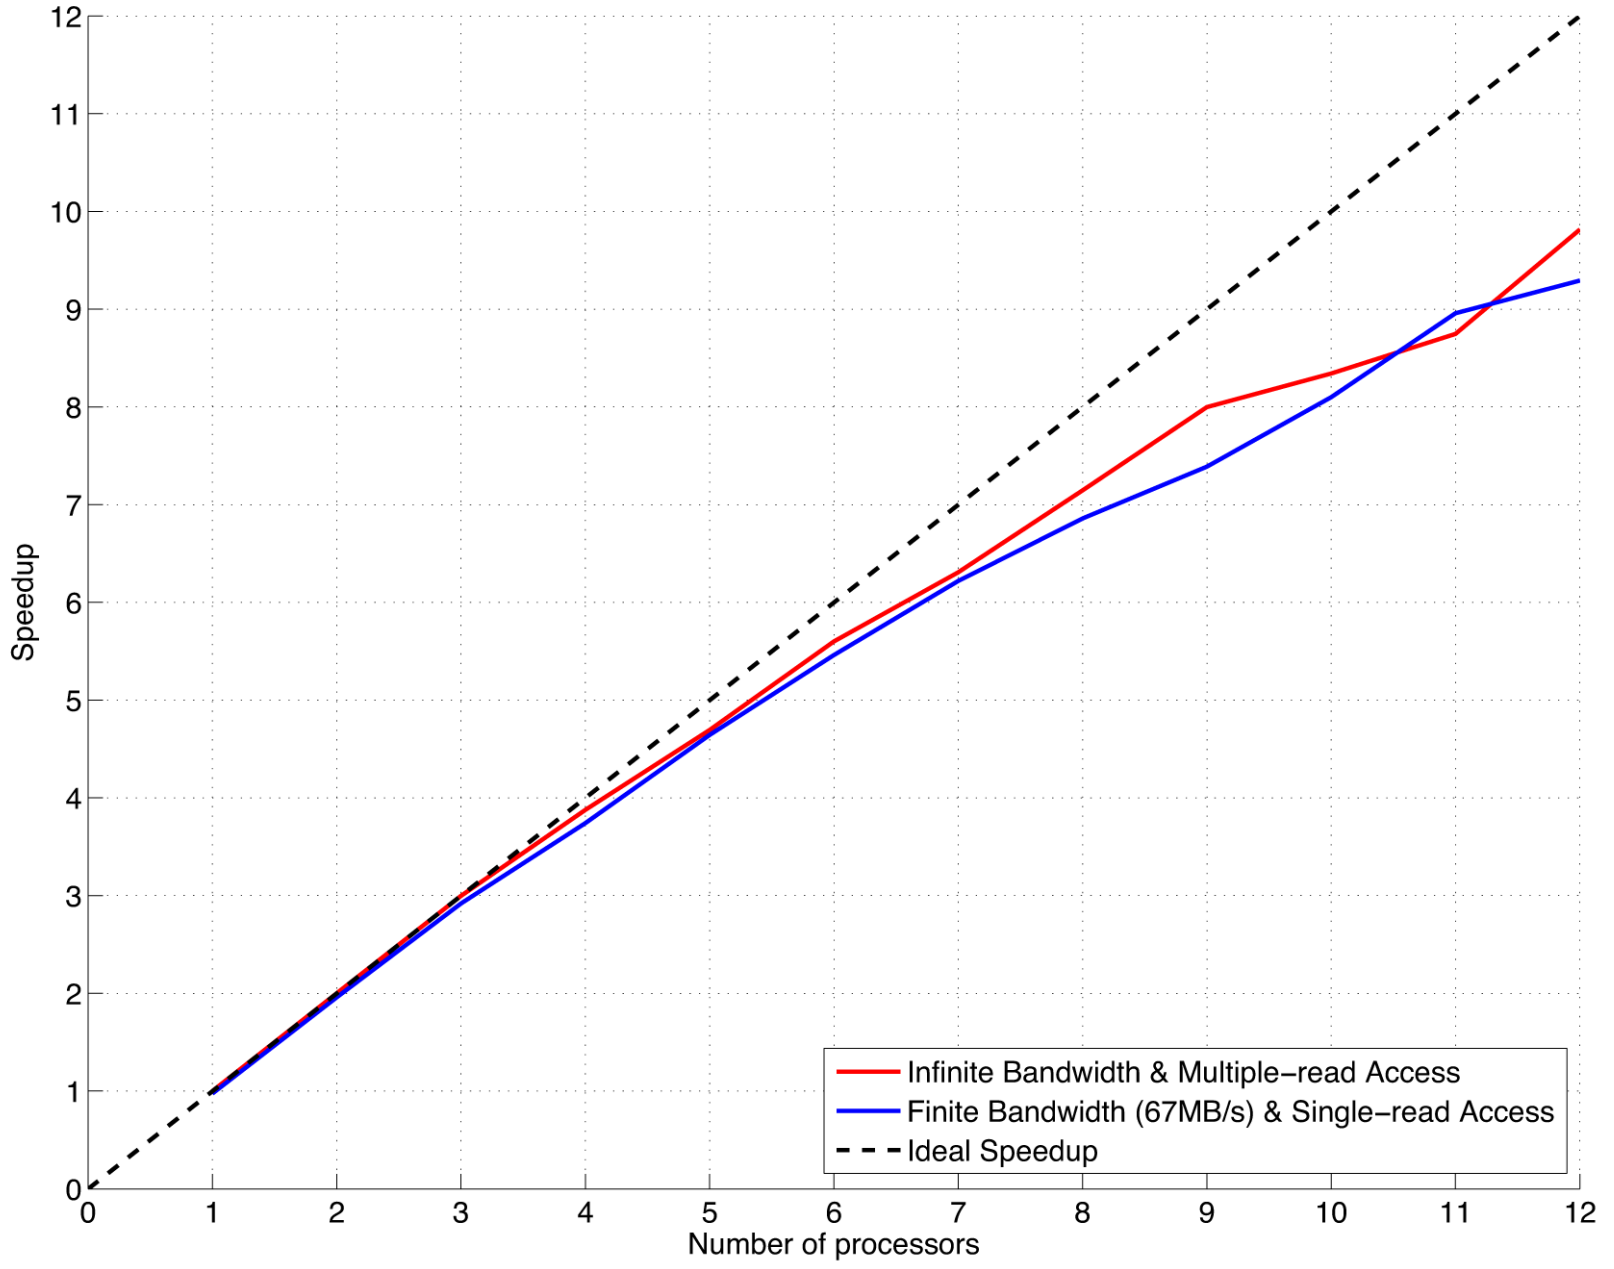

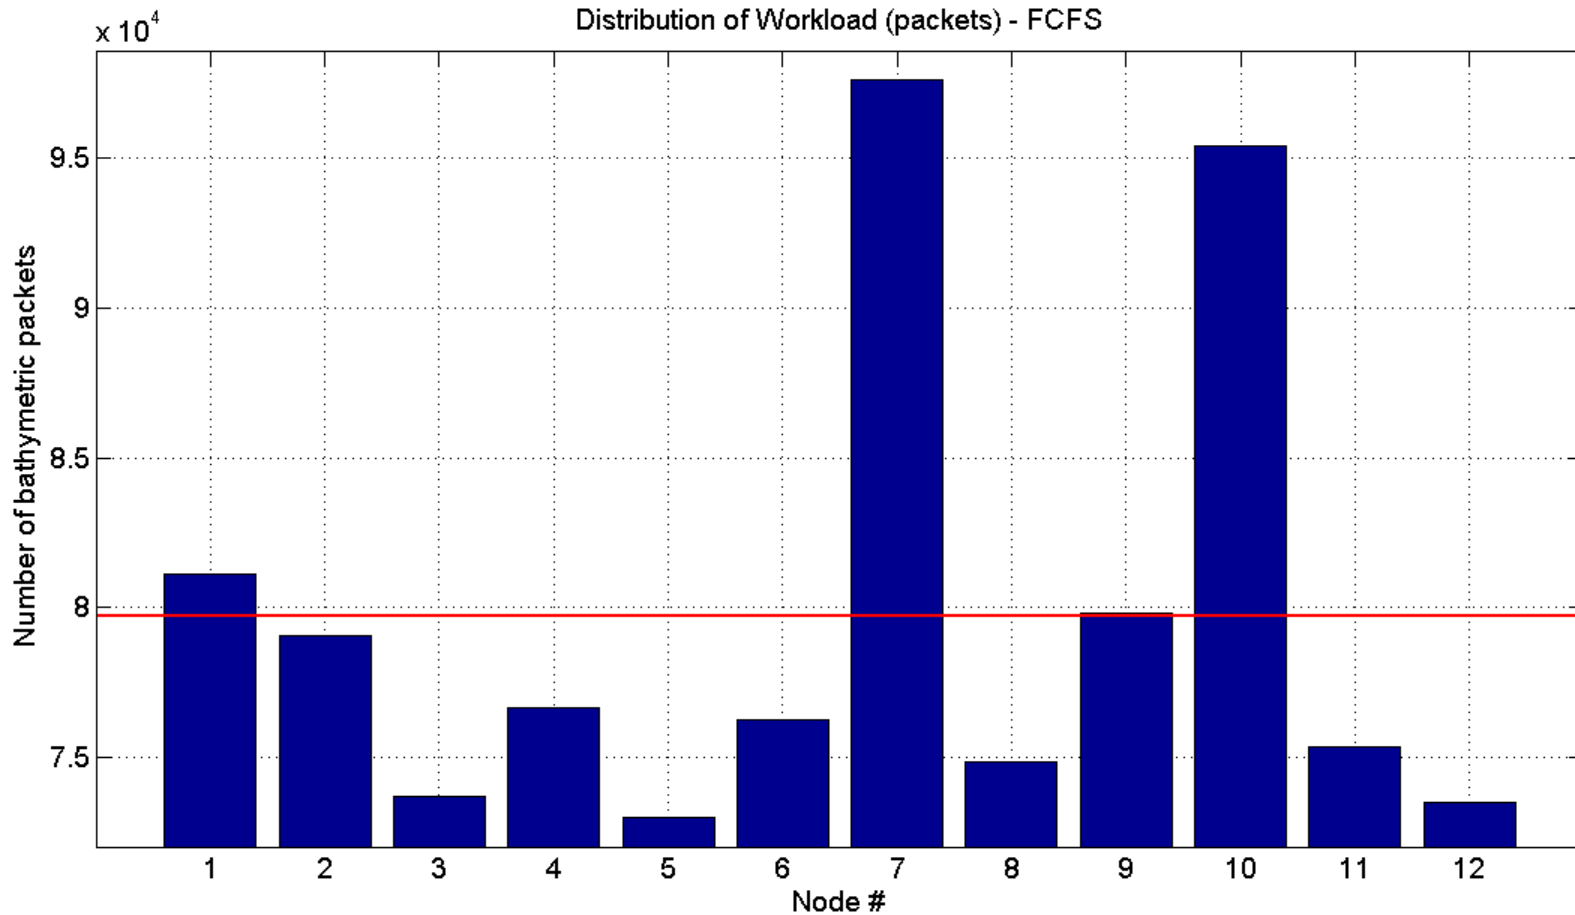

Distribution of Percentage Error with 3 Random Reads

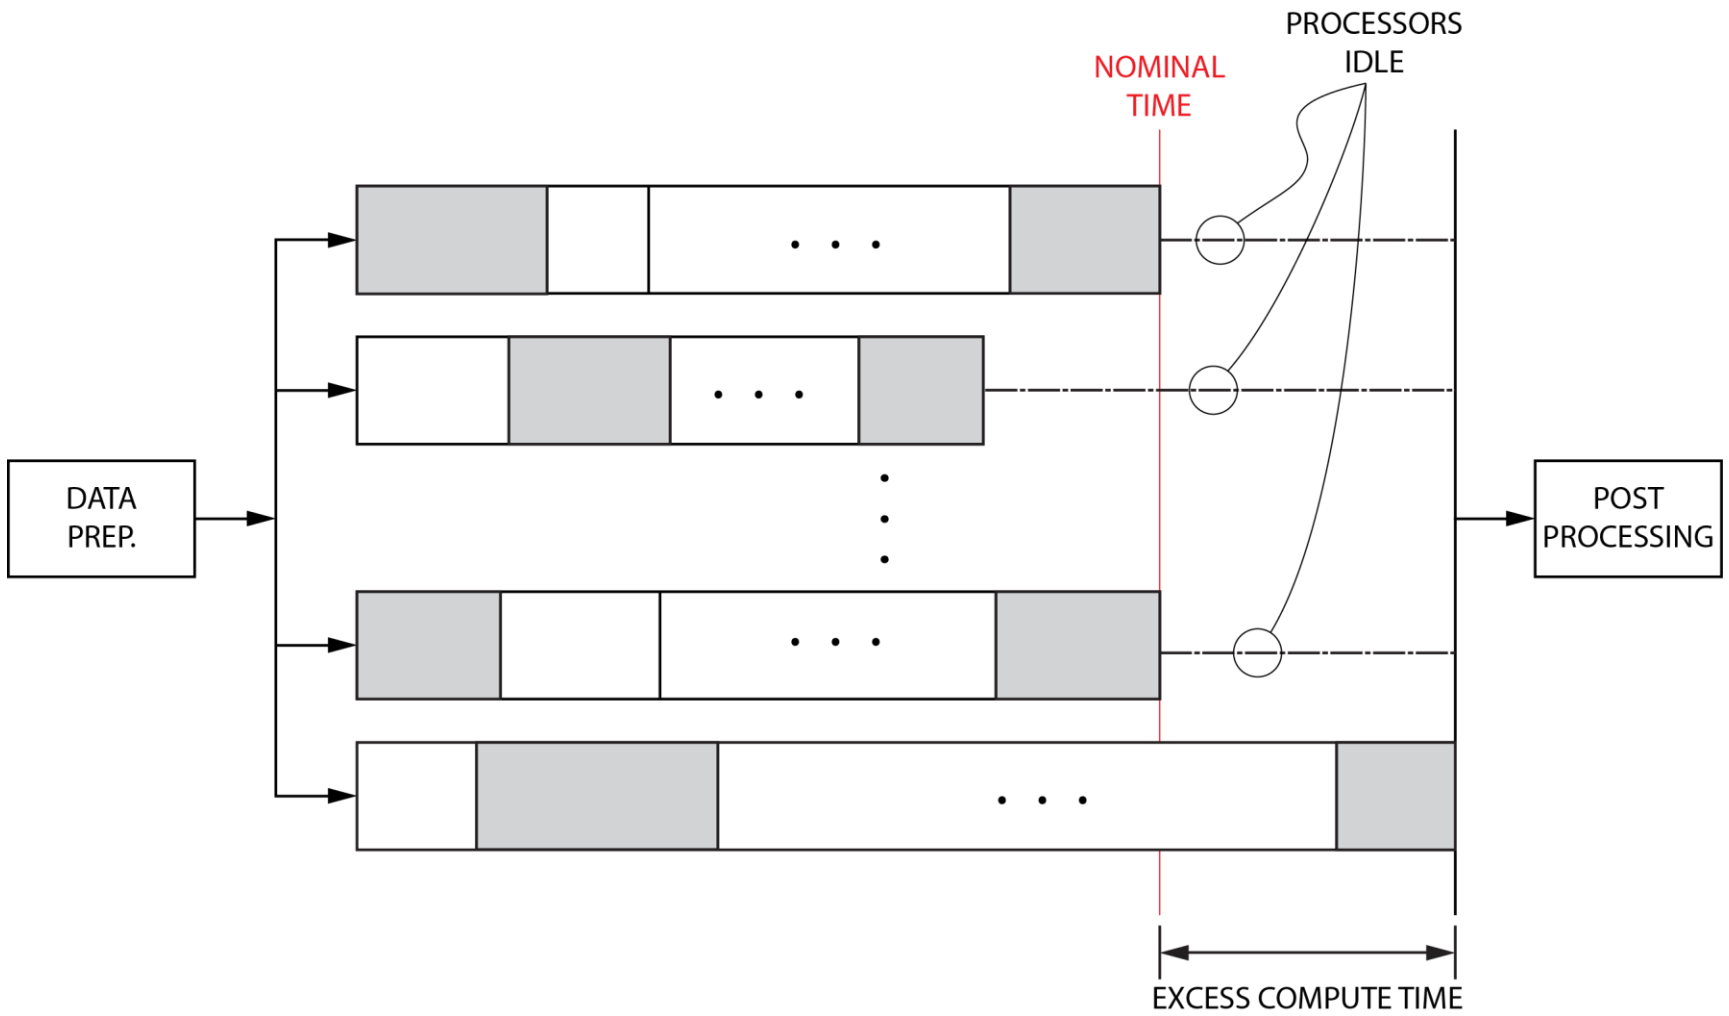

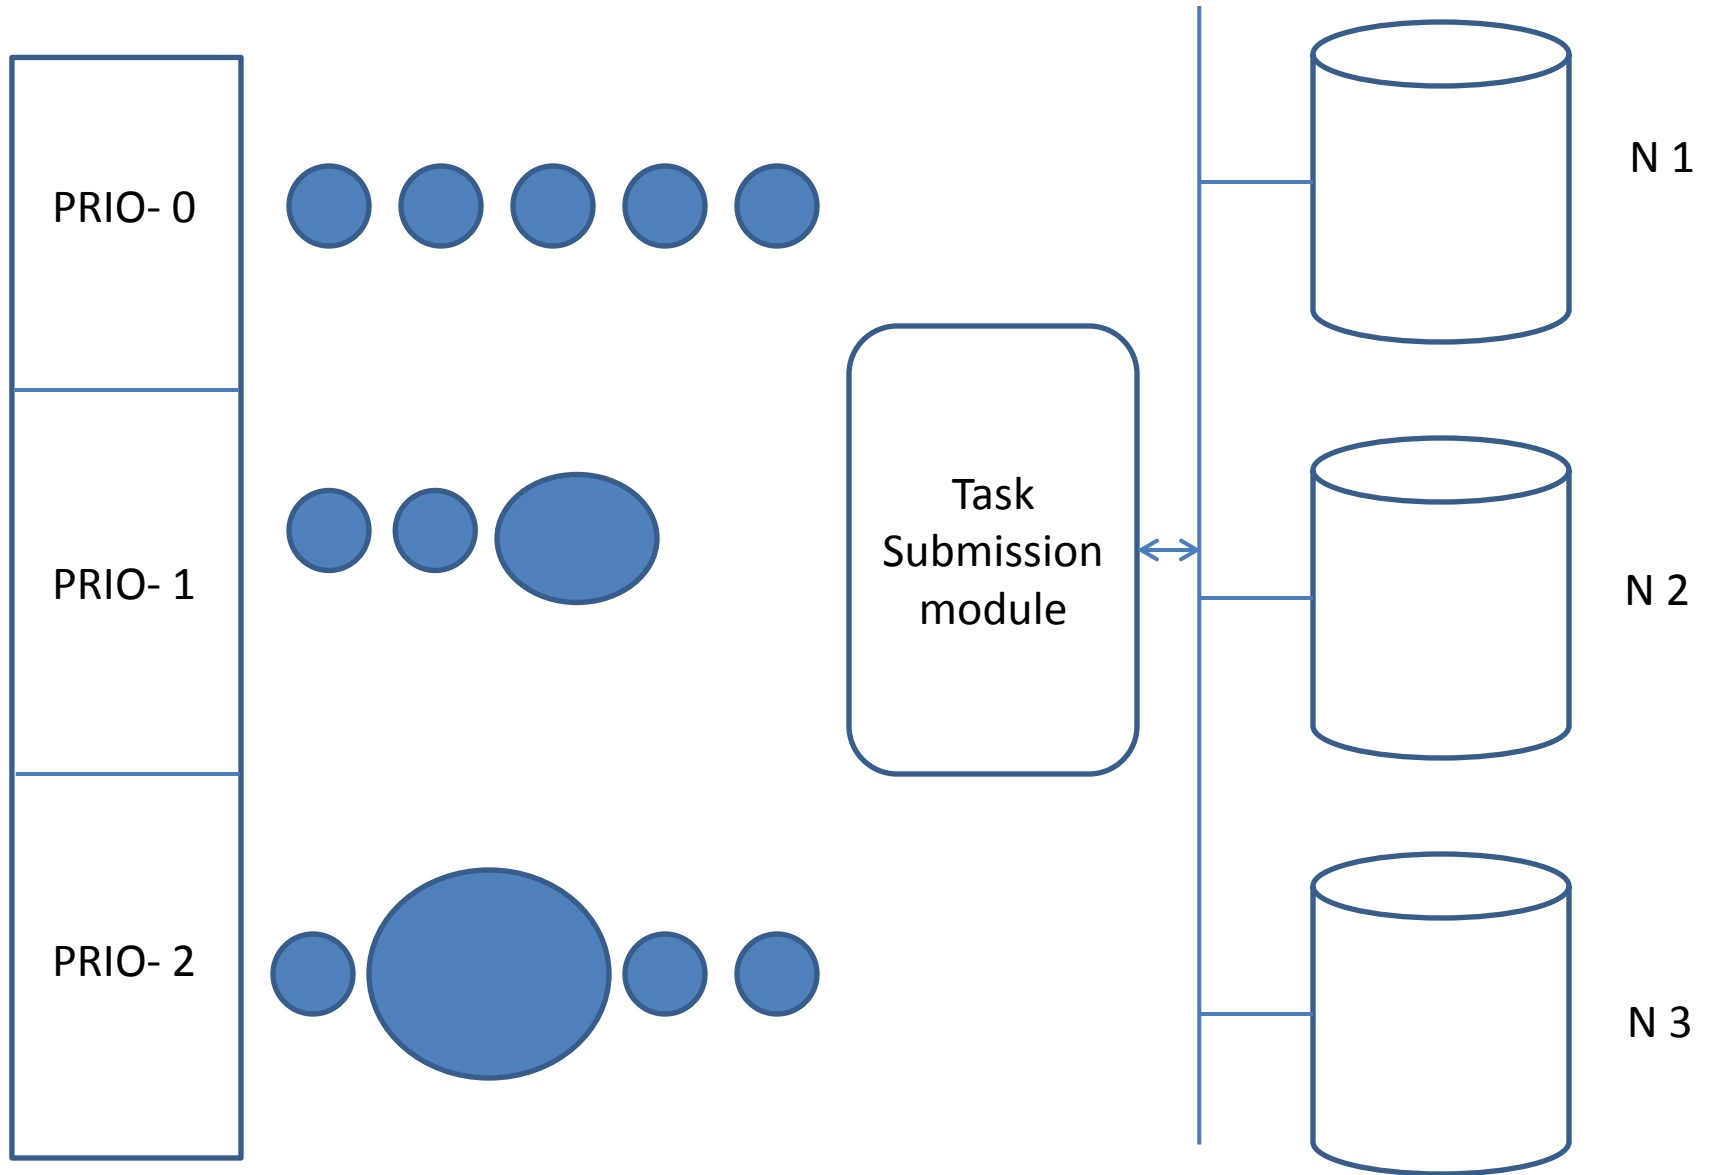

Speedup Comparison

Distribution of Workload (packets) - FCFS

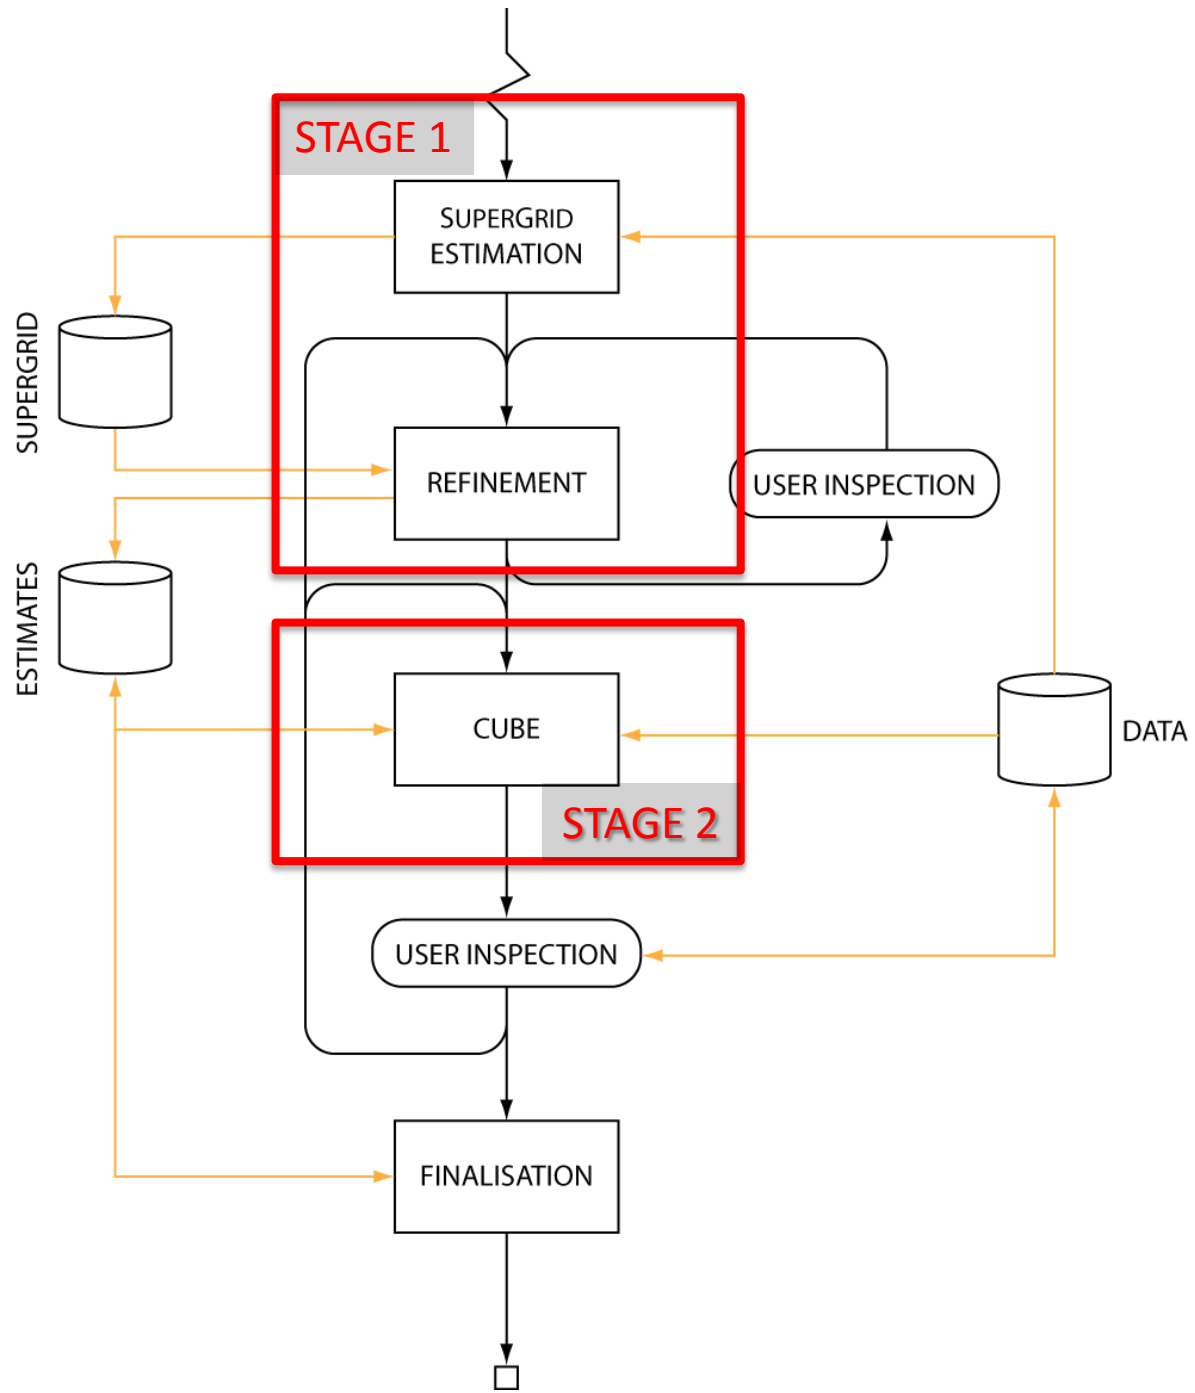

Speedup Comparison

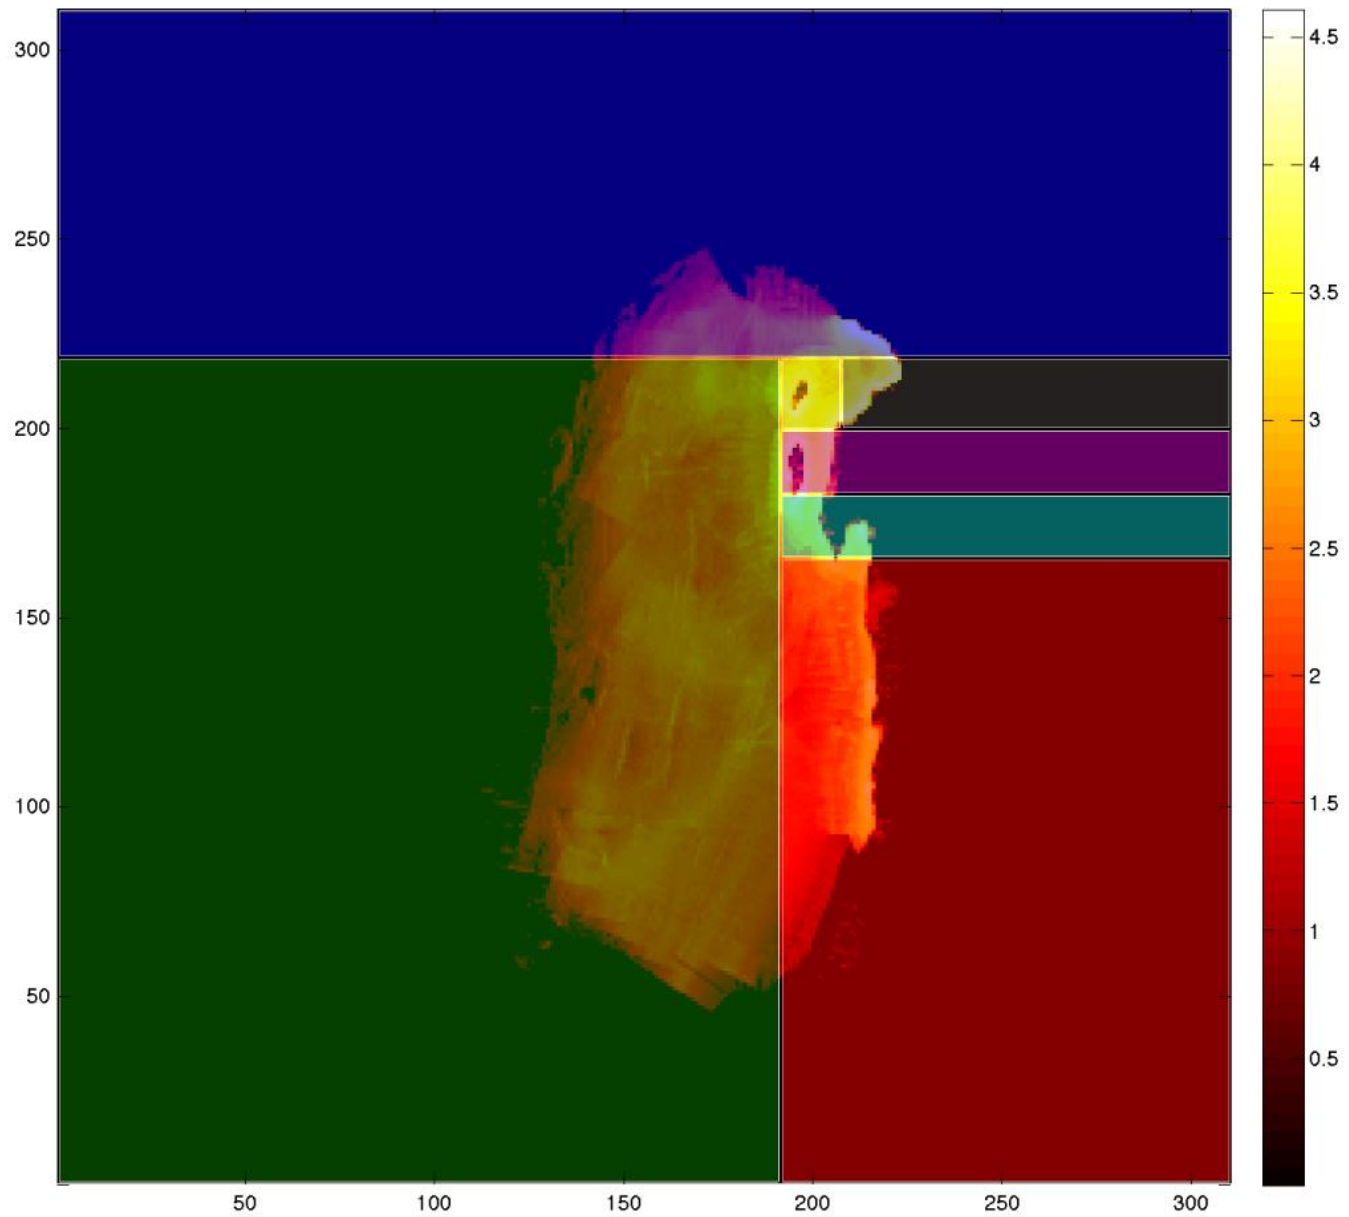

Robustness Experiment - 4

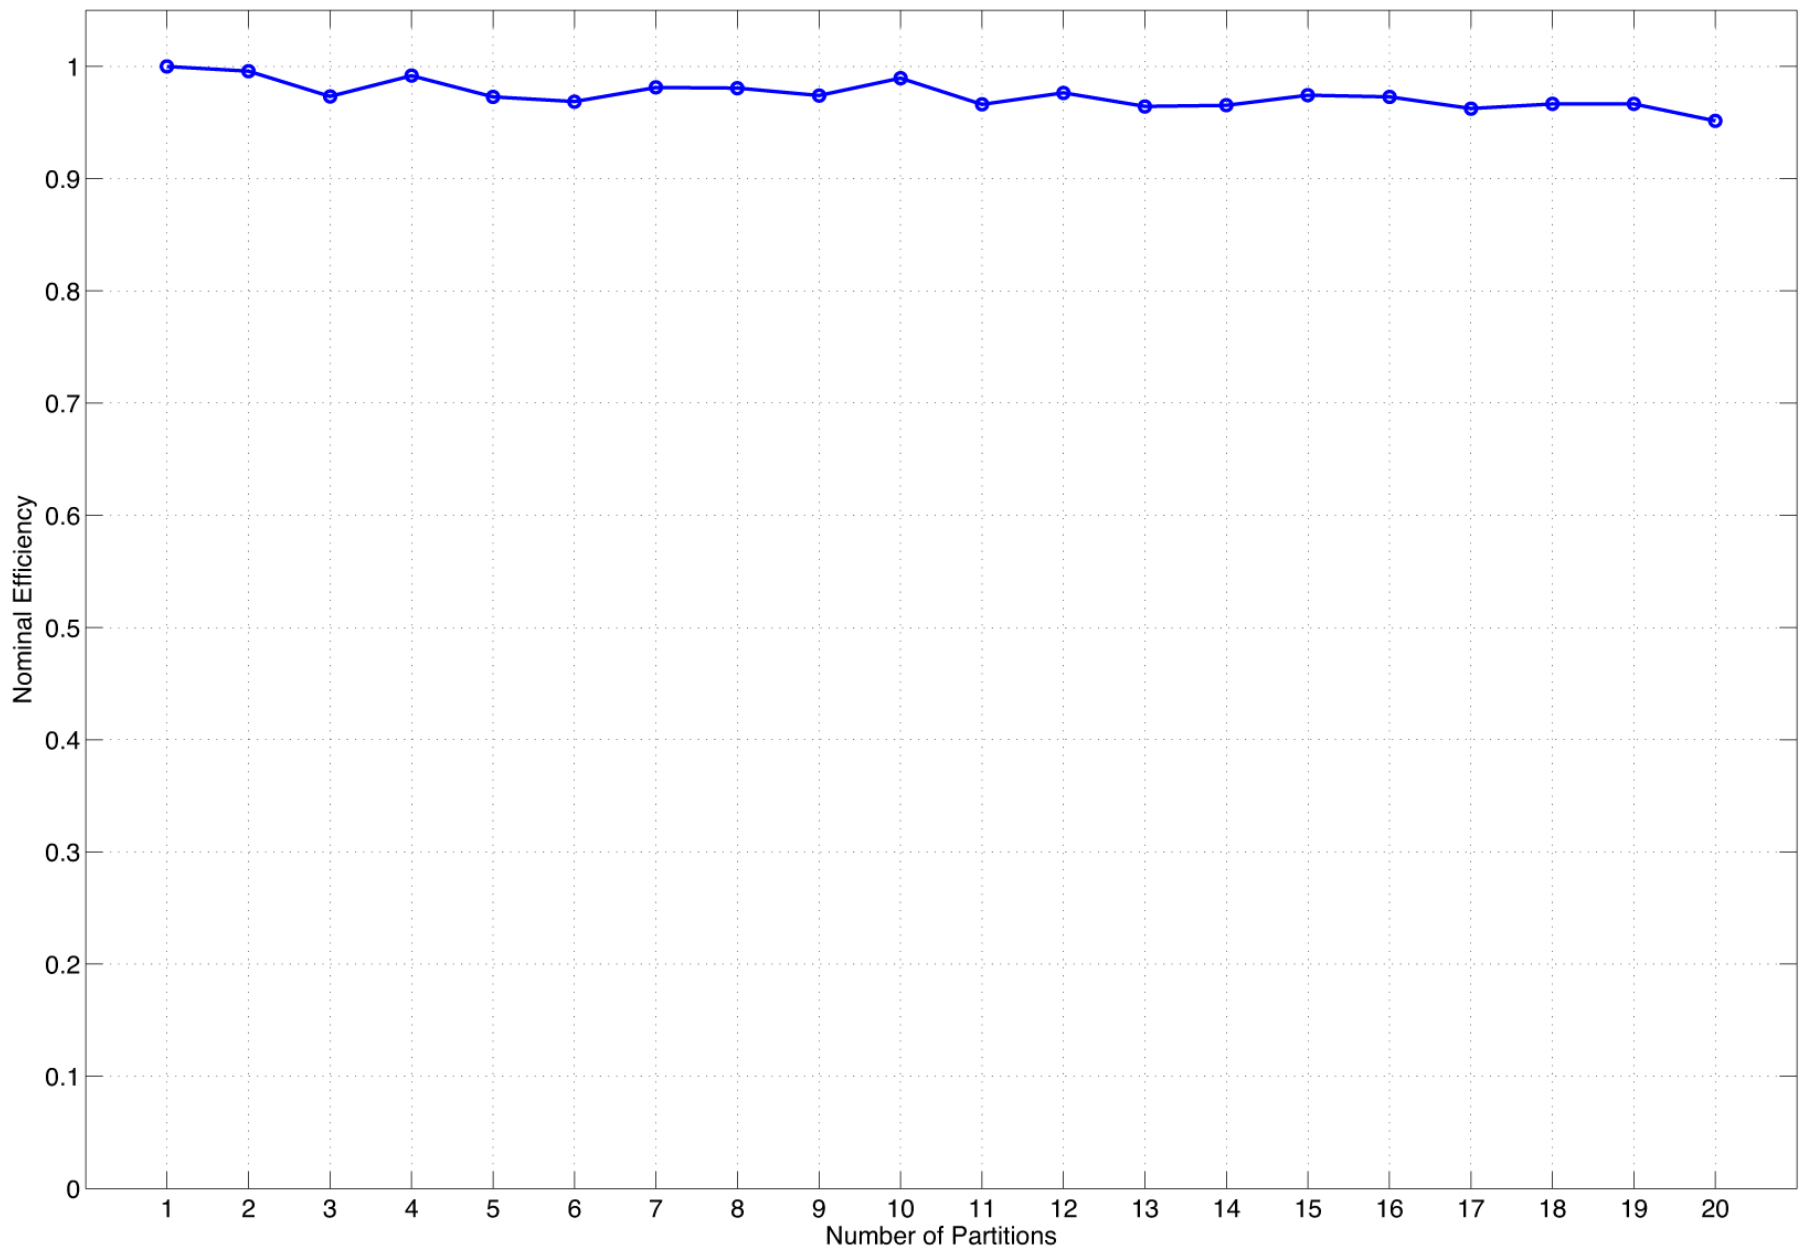

Conclusions

- Most hydrographic processing can be made “embarrassingly parallel”
- Efficiency is mainly about load balancing
- Close to optimal balancing constructed through approximate data volume estimates
- Very high efficiencies are [theoretically] possible
 - Speed up is then almost linear
 - I/O, Cache, Memory Bandwidth limits will constrain
- Algorithms can be robust to node/task loss
- “Optimal” algorithm may be a hybrid
 - Multi-node (multi-processor) for load distribution
 - Multi-threaded within the node for efficient utilisation
