# Upholstered Household Furniture in the United States: 

## A Survey of Current Ownership and Purchasing Plans

## Introduction

This report presents highlights of the results of a telephone survey of U.S. households concerning their ownership, purchasing plans, and preferences regarding upholstered household furniture. The survey was conducted in October and November 1989, by the Survey Research Unit of the Social Science Research Center of the Mississippi Agricultural and Forestry Experiment Station. The survey also included Canadian households, and subsequent reports will present results for Canada as well as statistical analyses of specific results for both countries. The survey was intended to help identify market potential for various items of upholstered household furniture, and the results are therefore not dependent on short-term economic conditions. The economic recession in the United States since the 1989 survey does not affect the validity of results; market potential becomes suppressed demand in an economic downturn.
A bank of residential telephone numbers for the continental United States, excluding Alaska, was purchased from Survey Sampling, Inc., of Fairfield, Connecticut. Although the sampling design is basically systematic, results can be treated as if they were obtained from a simple random sample because of the way the numbers are selected. Each telephone number from the bank was dialed, and if it yielded an answer, any available adult (over 18 years old) household member was interviewed. ${ }^{1}$ Four call-backs were attempted for unanswered/busy numbers before they were replaced. This procedure yielded 2,364 completed interviews. The number of interviews completed in each state is shown in Figure 1, and the

[^0]distribution of respondents by county is depicted in Figure 2.

## Objectives

The primary objective of the survey was to assess the potential for upholstered furniture sales in the United States for the next 4 to 5 years. Additional objectives were to ascertain who the potential buyers are in terms of demographics, to describe current furniture ownership, and to learn the preferences of furniture owners vis- $\alpha$-vis their furniture.

## Results

General results for the entire sample of 2,364 households are presented in the Appendix. These results can be generalized to all U.S. households with a maximum margin of error due to sampling of plus or minus 2 percent at an alpha level of 95 percent. In practical terms, an error of this magnitude means that if all households in the United States had been included in the survey, the results from our sample would be within two percentage points, plus or minus, of the total results 95 times out of 100 .

## General Result Highlights

Eighty-five percent of the households in our sample reported furniture ownership (see Appendix Item 1). Sofas are by far the most prevalent item of upholstered furniture; 96.5 percent of furniture - owning households have at least one, and 53.5 percent own two or more (Appendix Item 2). Nearly 40 percent of the households have had their oldest sofa for at least 10 years (Item 3). Only about 35 percent of furnitureowning households have loveseats, and fewer than 6 percent have more than one (item 4). Only one-fourth of the households with loveseats have had their oldest 'piece 10 years or longer (Item 5).
Recliner ownership occurs in 56.5 percent of
households owning furniture, but the majority of those households own only one (Item 6). Twenty-eight percent of households with recliners have owned the oldest one 10 or more years (Item 7). Upholstered rockers are least popular of the pieces inventoried; only 31.1 percent of households owning furniture have one (Item 8). Stationary chairs are considerably more numerous; 56.5 percent of households own at least one, and one-third own two or more (Item 10). However, households tend to keep these chairs longer; 46.4 percent have had their oldest chair 10 years or more, and nearly 35 percent have had their third oldest chair that long (Item 11).
About 53 percent of households currently owning furniture plan to purchase more in the next 4 to 5 years (Item 12). A few more plan to replace items than plan to purchase additional pieces, while about 10 percent plan to do both. Sofas will be the item most often replaced; nearly 22 percent of all U.S. households (79 percent of the "replacers") will replace at least one (Item 13). Loveseats, recliners, and stationary chairs will be replaced in about half of the replacing households, but only 22 percent plan to replace rockers (Items 14-17).
Before asking our furniture-owning respondents
about planned purchases of additional furniture items, we asked the 362 respondents who reported owning no furniture about their purchasing plans; 20.7 percent of them plan to buy some furniture in the next 4 to 5 years (Item 18). These 75 households were then included in our assessment of furniture additions. Once again, sofas will be the most-purchased item of upholstered furniture; nearly half of the households with plans to add furniture will buy a sofa (Item 19). Recliners will be next in popularity, followed closely by loveseats and stationary chairs (Items 20, 21, and 23). Rockers will be the least purchased item; only about eleven percent of households planning to add furniture will buy a rocker (Item 22).
What are the major obstacles to furniture purchasing perceived by the 1,300 households in our sample with no purchasing plans? A large majority-over 85 percent-consider their present furniture adequate (Item 24b); nearly 40 percent do not feel they can afford new furniture (Item 24a) while about one-fourth do not like current furniture styles and consider furniture a relatively unimportant matter (Items 24c and 24d).
Exposed wood is important to 40 percent of all households (Item 25), and two-thirds consider stain

Figure 1. The distribution of 2.364 survey respondents by state and by census regions.

## Distribution of Upholstered Furniture Consumer Study Respondents <br> Counties are Snaded According to Number of Respondents

color to be important (Item 26), with a. "medium" stain being the shade of choice by 42 percent (Item 27). Nearly 90 percent attach importance to the material used in upholstered furniture frames; wood is the near-unanimous choice among them (Items 28 and 29).

Appendix Items $30-37$ show results of the demographic questions included in the survey. These items were selected on the basis of their frequent association with furniture buying behavior. In an analysis not included in this report, we found a strong statistical correlation between each of these demographic variables and reported furniture buying plans (Appendix Item 12). In the tables that follow, furniture ownership, preferences, and purchasing plans are examined against this demographic backdrop.

## Result Highlights for Geographic Areas

Since the sample size in most states is too small to produce meaningful results, we decided to use Bureau of the Census regions as the major geographic subdivision for summarizing results. Boundaries of these nine regions are shown on Figure 1, and the states comprising each region are listed in a footnote to Table 1.

Based on an earlier analysis of retail sales ${ }^{2}$ and on the number of observations in our survey, we also identified seven geographic areas that may be considered major markets for furniture sales. These areas are identified and results are arrayed for them in Table 2.

## Census Region Highlights: Table 1

Although there are no dramatic differences in survey results between regions, several slight differences are noted that may have important marketing implications.

- The proportion of furniture-owning households planning purchases in the next 4 to 5 years ranges from 48.7 percent in Region 6 to 58.5 percent in Region 7. Although replacement plans are nearly equal in the two regions, households in Region 7 are more likely to plan additions.
- Loveseat ownership is most prevalent in Region 2 and least prevalent in Region 4. However, households in Region 4 own slightly more loveseats than households in Region 2 own.

[^1]- Recliner ownership is most prevalent in Region 6 and least prevalent in Region 2. Households in Region 8 own the most recliners per household.
- Stationary chair ownership is widely disparate. Forty-eight percent of the households in Region 9 own such chairs while 68 percent in Region 1 reported chair ownership.
- Loveseat additions will be particularly popular in Regions 4 and 7 over the next 4 to 5 years.
- Recliner additions will be most prevalent in Regions 7, 8, and 9.

## Potential Market Area Highlights: Table 2

- The largest percentage of households planning furniture purchases is in Texas ( 58.7 percent) followed by California ( 57 percent).
- The best potential market for sofa sales in the next 4 to 5 years appears to be California. Nearly 22 percent of the households plan to add an average of about 1.4 sofas each, and about 32 percent plan to replace 1.3 sofas each. Good market potential also exists in the midwestern states of Illinois, Indiana, and Ohio.
- California shows good potential for loveseat sales over the next few years, although Florida will add more per household and the South Atlantic states (Georgia, South Carolina, North Carolina, and Virginia) will replace more. Washington/Oregon households have good potential for purchasing additional loveseats, but are among the lowest in planning replacement.
- Recliner ownership is above 50 percent in all areas except California (45.6\%) and New York/New Jersey/Pennsylvania (45.2\%). Again, California shows good market potential with 34 percent of households planning additions and 18 percent planning replacements. Thirty-five percent of households in Georgia/South Carolina/North Carolina/Virginia plan to add about 1.3 recliners each , but only 12 percent plan replacements.
- Market potential for upholstered rockers is not particularly strong in any of the areas; only about 12 percent of all households plan additions and fewer than 9 percent plan replacements. California and Texas are exceptions as far as additions are concerned, where more than 20 percent of households report plans to add one rocker each.
- Stationary chair ownership is above 50 percent for households in all areas except California, where 47 percent own such chairs. Market potential is good in the South Atlantic group of states, in the Midwest, and in California.
- Although wood is the overwhelming preference for frame material, nearly 12 percent of the households in Florida prefer other materials, and 6 percent of California households prefer metal frames.

## Results for Major Demographic Groups

The demographic characteristics of households in each of the nine census regions and in the U.S. are presented in Table 3. (Also, see Items 30-37 in the Appendix.) Tables 4 through 11 show the survey results arrayed by these demographic characteristics. These presentations are intended to further assist in the identification of types of households that show the greatest potential for upholstered furniture buying in the next 4 to 5 years.

## Size of place of residence (Table 4)

- Households in towns and small cities with a population of $10,000 \cdot 50,000$ are most likely to have furniture buying plans. Rural nonfarm households also have ambitious buying expectations while households in large metropolitan areas lead in replacement plans.
- Households in large metropolitan areas (greater than one million population) will be the most active sofa buyers in the next 4 to 5 years. Although only 25 percent of the two sofas owned by each household are ten years old or older, 32 percent of the households will replace 1.3 of them. Plans for additions are more modest but still among the highest of the residential categories. Farm and ranch households tend to keep their sofas longer; nearly 40 percent are at least 10 years old.
- Loveseats will be a popular addition in rural nonfarm households; about 40 percent plan to add about one unit each. However, replacement plans are low among nonfarm and farm residents, even though greater than average percentages report older loveseats.
- As size of place of residence decreases, popularity of recliner ownership steadily increases. Recliners are very popular among all rural dwellers in both percentage of households owning and average number owned per household. However, urban residents will be more active recliner purchasers where 30 percent of households in cities of $50,000-100,000$ will add and 23 percent of metropolitan area households will replace.
- While prospects for the upholstered rocking chair market are lowest of all furniture items included in the survey, households in large metropolitan areas and in mid-size ( $10,000-50,000$ ) and small (fewer than 10,000 ) towns are slightly above national averages in their purchasing expectations.
- Stationary chair ównership is very evenly distributed across residential categories, but city residents own more chairs per household than their small town and rural counterparts. Plans for additions are fairly constant also, except in rural nonfarm
households where the percentage of those planning to make additions is about half the national figure. Farm and ranch households reported very ambitious plans for adding chairs; these households may add three chairs each in the next 4 to 5 years.

## Household type (Table 5)

- Households with children present, whether headed by a couple or a single parent, have the most ambitious furniture buying plans. Nearly 30 percent of single parent households plan to replace furniturethe highest percentage with such expectations among all demographic categories. Couples with no children at home have the lowest buying expectations.
- Single persons have the most ambitious plans for adding sofas; 27 percent of those who currently own sofas plan to add an average 1.3 units in the next 4 to 5 years. However, households containing children are most likely to replace their sofas, even though the ones they have are not as old as those owned by the other household types.
- A big proportion of single parents and single persons will be shopping for additional loveseats in the near future, with each household planning to add about 1.2 units each. Single parent families will be the most active in replacing loveseats, although the number to be replaced per household is lowest among household types.
- There should be a good market for recliners among singles in the next few years; 40 percent of those households will add nearly 1.4 units each. Once again, however, families that include children are more likely to replace their recliners.
- Single parents plan to be the most active when it comes to adding and replacing rockers even though they are near the bottom in current rocker ownership. However, fewer than 10 percent of any of the households have replacement plans for their rocking chairs.
- Thirty percent of the singles households will add two stationary chairs each within 4 to 5 years, while 25 percent of single parents will replace one and twothirds of their two present chairs.
- Although the majority of all households consider their present furniture adequate, financial deterrents to buying are important in more than 40 percent of all households except those of childless couples.

## Age of respondent (Table 6)

- Among the demographic characteristics we examined, age of household adults is the best predictor of furniture buying plans. More than two-thirds of the respondents between 21 and 30 years of age report plans to buy furniture. As the age of respondents in-
creases, there is a steady decline in buying plans.
- The most active sofa buyers over the next 4 to 5 years will be those 50 years of age and younger. The percentage of households anticipating the purchase of additional sofas increases steadily as the age group of the respondent decreases. However, the greatest number of new sofas will be purchased by those in the 41- to 50 -year age group. Percentage of households planning to replace sofas increases 10 . points (from 22 to 32 ) between the under- 20 -year-old group and the 21 - to 30 -year group, levels off through the 41- to 50 -year group, then begins to decline rapidly. However, the 1 -in-10 households wherein the respondent was between 61 and 70 years of age have the most ambitious replacement plans; they will replace an average of nearly two sofas each.
- There should be a good market for loveseats in households where respondents are between 21 and 30 years of age; 55 percent of them will add 1.1 loveseats each, and 20 percent will replace about the same number. The same general pattern holds for all other furniture items, so it appears that these younger households will be a major factor in furniture sales.

## Occupation (Table 7 and Table 8)

Since the interviews were conducted with any available adult household member, we asked for the occupation of both the respondent and, when applicable, the respondent's spouse. It should be pointed out that 60 percent of the respondents were female (see Table 3). ${ }^{3}$

- There is little variation in furniture ownership and purchasing plans between major occupational groups for the respondents or their spouses. Recliners are somewhat more popular with blue collar respondents -60 percent of their households own 1.5 each. However, addition and replacement plans are very similar across the three occupational groupings.
- Among respondents, sales and clexical workers are least satisfied with their present furniture, although nearly 82 percent still consider it adequate.
- Households wherein the respondent's spouse is employed in a sales or clerical job are most likely to add and replace loveseats in the next 4 to 5 years.
- Recliner ownership and purchasing plans are high for the blue collar households, although differences from the other groups are small.
${ }^{3}$ Although one might assume that the wife dominates in furniturebuying plans, one of the rare studies of purchasing decision-making that included a furniture item as the object of purchase found that the decision was "syncratic," or equally influenced by husband and wife. (E. H. Bonfield, "Perception of Marital Roles in Decision Processes: Replication and Extension," in H. Keith Hunt, ed., Advances in Consumer Research. Ann Arbor, M1. Association for Consumer Research, V. 302, 1978.)
- There will be a small but active group of stationary chair buyers in households where spouses are in sales and clerical jobs; only 5 percent of them will add chairs, but the mean is 2.75 chairs each.
- Finances are an important deterrent to purchasing furniture in households where the respondent's spouse is a blue collar worker.

## Household income (Table 9)

- While furniture buying plans and income level obviously are correlated, there is not the steady increase in buying plans as income increases that one might expect. However, between 10 and 20 percent more of the higher income households (above $\$ 25,000$ ) expect to buy furniture than the lower income households (below $\$ 10,000$ ) expect to bny. The most noticeable difference in buying plans as one moves up the income scale is the percentage of households planning to both add and replace furniture.
- The households with higher incomes tend to own more pieces of furniture per household.
- More of the furniture owned by the lower income households is at least 10 years old.
- A much greater proportion of lower income households than higher income households plan to add loveseats in the next 4 to 5 years. This trait does not apply to any other furniture items.

## Education (Tables 10 and 11)

- In general, the more highly educated households are more likely to buy furniture in the next 4 to 5 years. Sixty percent of the households wherein the respondent and/or the spouse have at least a college education plan to make purchases.
- Differences between education categories in ownership and purchasing plans of individual items of furniture are not obvious. Since education and income usually are closely correlated, results for these two variables are very similar.

## Conclusions

Based upon the reported plans of respondents in our sample, nearly half ( 47.9 percent) of all households in the United States will buy some upholstered furniture in the next 4 to 5 years. About 20 percent plan to add furniture (including households not currently owning), 20 percent plan to replàce, and 8 percent plan to do both. For individual furniture items, the percentage of households planning to purchase ranges from a low of 4.7 percent in the case of rocking chairs to a high of 35.1 percent for sofas. About one-fifth of all households plan to buy loveseats or recliners. Purchasing plans do not vary dramatically across major
geographic regions. However, households in Texas, the Midwest, California, and the South Atlantic states reported more ambitious buying plans than was reported by households in the Pacific Northwest, Florida, or the Northeast. The perception that their present furniture is adequate is the most important factor in dampening furniture-buying plans.
Demographically, households most likely to be planning to buy furniture are those that include children
and are headed by young, well-educated adults with a combined annual income in excess of $\$ 25,000$. Urban households wherein the adults are employed in professional or managerial occupations are slightly more apt than other households to have furniture buying plans. However, numerous exceptions to these generalizations have been noted, as the appeal of various furniture items differs among demographic groups.

Table 1. Upholstered household furniture ownership, purchasing plans, and preferences of U.S. households by census regions, 1989.

| Characteristics | Regiona ${ }^{1}$ |  |  |  |  |  |  |  |  |  |

${ }^{2}$ Census region composition is as follows:
Region 1 (New England): Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut
Region 2 (Middle Atlantic): New York, New Jersey, Pennsylvania
Region 3 (East North Contral): Ohio, Indiana, Illinois, Michigan, Wisconsin
Region 4 (West North Central): Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas
Region 5 (South Atlantic): Delaware, Maryland, District of Columbia, Virginia, North Garoline, South Caroline, Georgia, Florida, West Virginia
Region 6 (East South Central): Kentucky, Tennessee, Alabama, Mississippi
Region 7 (West South Central): Arkansas, Louisiana, Oklahoma, Texas
Region 8 (Mountain): Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada
Region 9 (Pacific): Washington, Oregon, California
${ }^{2}$ Although 2,864 households were contacted, information on geographic location/census region was not obtained in 4 households.

| NA/Missing | 815 | 34.5 | - |
| Total | 2,364 | 100.0 | 100.0 |

[^0]:    ${ }^{1}$ The uuit of interest in the survey was a "household," and we assumed that any member 18 years of age or older could answer the questions for his or her household. However, the vast majority of actual respondents were heads of households or their spouses. Only 211 of the 2,364 households contained dependent children over the age of 18 , and very few of these individuals supplied the information for the survey
