# Atroposelective formation of dibenz[c,e]azepines via intramolecular direct arylation with centre-axis chirality transfer $\dagger$ 

Caroline A. Cheetham, Richard S. Massey, Silvain L. Pira, Robin G. Pritchard and Timothy W. Wallace*<br>Received 16th October 2010, Accepted 10th December 2010<br>DOI: 10.1039/c0ob00889c

5-Substituted 6,7-dihydrodibenz[ $[, e]$ azepines, a class of secondary amine incorporating a centre-axis chirality relay, are accessible from 1-substituted $N$-(2-bromobenzyl)-1-phenylmethanamines via $N$-acylation and ring-closing intramolecular direct arylation. The ring closure proceeds with high atropodiastereoselectivity due to strain effects that are induced by trigonalisation of the nitrogen atom, as predicted using molecular mechanics calculations.

## Introduction

Three-atom bridged biaryls have unique conformational features arising from their connectivity, which obliges the $\mathrm{Ar}-$ bridge and $\mathrm{Ar}-\mathrm{Ar}$ bonds to twist in concert. In 6,7-dihydro$5 H$-dibenz[ $c, e]$ azepines $\mathbf{1}$ this has the effect of transforming conformational bias at the benzylic carbon atoms into torque at the biaryl axis and vice versa, so that in the presence of a substituent at $C(5)$ or $C(7)$ the system operates as a centre-axis chirality relay that can be controlled through substitution at $\mathrm{N}(6)$. This is illustrated by the behavior of the amines ( - )-2 and ( - )-3, whose respective Boc derivatives ( + )-4 and (+)-5 have inverted, conformationally stable, biaryl axes, as predicted on the basis of molecular mechanics calculations. ${ }^{1}$ As a corollary it can be suggested that the dynamics of the biaryl axis in derivatives of $\mathbf{1}$, which are potential tropos ligands, ${ }^{2}$ will be subject to the integrated effect of all pairwise interactions between adjacent substituents on $C(4), C(5), N(6), C(7)$ and $C(8)$, in addition to those at the usual biaryl control sites, $\mathrm{C}(1)$ and $\mathrm{C}(11)$. To facilitate a broad study of this phenomenon we required a more flexible synthetic route to amines such as (-)-2, which we first prepared from the lactam 6 and used as the precursor to 3-5. ${ }^{1}$

[^0]The importance of biaryls in biological, synthetic and materials chemistry has inspired the development of numerous methods for their assembly with control of axial chirality, ${ }^{3,4}$ a common strategy being to link a pair of functionalised aryl units through a centrally chiral tether prior to aryl-aryl coupling, which may then proceed atroposelectively. With this in mind, we were attracted by the retrosynthesis shown in Fig. 1, as it allows the centreaxis relay to direct its own atroposelective formation and exploits the availability of numerous amines of the form 7 in enantiopure form. ${ }^{5}$

Fig. 1 Proposed atroposelective route to dibenz[ $[, e]$ azepines.
A literature search revealed that the existing $\mathrm{Ar}-\mathrm{Ar}$ coupling routes to dibenz $[c, e]$ azepines lack generality, ${ }^{6,7}$ involve toxic reagents ${ }^{6,8,9}$ or use activating substituents in both coupling partners (X, Y = I, Br, OTf, etc.). ${ }^{8-10}$ However, a potential solution to this problem was offered by intramolecular direct arylation, which Fagnou and coworkers had shown to be capable of closing seven-membered rings. ${ }^{11-13}$ We now report the successful use of this methodology ${ }^{14}$ in concise atroposelective routes to 5 -substituted 6,7-dihydro- 5 H -dibenz[ $c, e]$ azepines.

## Synthesis of Materials

We initially targeted the amine (+)-2, preparing the substituted dibenzylamine required for the cyclisation step in a reductive amination sequence (Scheme 1). The condensation of $(S)$-1phenylethylamine (-)-8 with $o$-bromobenzaldehyde $\mathbf{9}$ gave the imine 10, which was reduced to the amine $\mathbf{1 1}$ in good yield. Trifluoroacetylation gave the corresponding amide $\mathbf{1 2}$ as a mixture of $E$ - and $Z$-rotamers (ratio ca. 2:1). ${ }^{15}$

Scheme 1 Preparation of amine 2 via reductive amination.

The cyclisation of $\mathbf{1 2}$ under Fagnou's original conditions, ${ }^{11 b}$ using 0.1 mol equivalents each of $\operatorname{Pd}(\mathrm{OAc})_{2}$ and the phosphine $\mathbf{1 3}$, provided the product 14 in $60 \%$ yield as a $9: 1$ mixture of rotamers (mainly 14a). The by-product $\mathbf{1 5}$, expected to arise through reductive debromination of $\mathbf{1 2}$, was detected in the product mixture but its formation was observed to be minimal when the ligand: Pd ratio did not exceed $1: 1$. The pseudoaxial orientation of the methyl groups in each of the rotamers of $\mathbf{1 4}$ is apparent from their upfield chemical shifts [ $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.92$ and 0.97 respectively], which confirm their proximity to the A-ring, and that the biaryl axis is therefore $(S)$-configured. Hydrolysis of $\mathbf{1 4}$ gave the amine $(+)-2(97 \%)$, whose structure and configuration were confirmed by comparison with a sample of $(-)-\mathbf{2} .^{1}$

As an alternative route to the amine 2, we established that a cyclisation substrate can also be assembled using $N$-alkylation as the key step (Scheme 2). ${ }^{16}$ Treatment of the Boc derivative 16, derived from $(S)-8$, with base and then 17 gave the alkylation product 18 in moderate yield. The cyclisation of $\mathbf{1 8}$ was attempted using Fagnou's later conditions, ${ }^{12}$ in which the reaction temperature is $130{ }^{\circ} \mathrm{C}$ and acetate is supplanted with pivalate. This provided the

Boc azepine (-)-4(50\%) which was confirmed as the pure ( $5 S, \mathrm{a} S$ )diastereoisomer by NMR [ $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.88(3 \mathrm{H}, \mathrm{d}, J=$ $7 \mathrm{~Hz}, 5-\mathrm{Me})]$ and polarimetry $\left\{[\alpha]_{\mathrm{D}}^{24}-322 \pm 9\left(c 0.61, \mathrm{CHCl}_{3}\right)\right.$; lit. ${ }^{1}$ for $\left.(5 R)-4[\alpha]_{\mathrm{D}}^{25}+321 \pm 10\left(c 0.82, \mathrm{CHCl}_{3}\right)\right\}$. The conversion of $(-)-4$ into $(+)-2(87 \%)$ was effected with phosphoric acid in THF. ${ }^{17}$ The $N$-alkylation route was also used to assemble the amine $\mathbf{2 2}$ via a short sequence in which the intramolecular direct arylation also effects the desymmetrisation of a diphenylmethyl group. Thus, treating the Boc derivative 19 of diphenylmethylamine with base and $\mathbf{1 7}$ gave the alkylation product $\mathbf{2 0}$ in $80 \%$ yield. The Pd-mediated cyclisation of 20 gave the carbamate ( $\pm$ )-21 (72\%), which was shown to be the 5 -axial diastereoisomer by X-ray crystallography (Fig. 2). Hydrolysis of ( $\pm$ )-21 with phosphoric acid gave the amine ( $\pm$ )-22 ( $96 \%$ ) as colorless crystals, m.p. $117-118^{\circ} \mathrm{C}$.

## Discussion

The distinctive features of $\mathbf{2 1}$ and $\mathbf{2 2}$ serve to illustrate how the axial configuration, and associated properties, of a 5 -substituted dibenz[ $c, e]$ azepine can be induced to 'switch' by changing the $N$ substituent. The ${ }^{1} \mathrm{H}$ NMR spectra of both of these compounds display resonances attributable to upfield-shifted aromatic protons, two at 6.6 ppm for 21 (Fig. 2b) and one at 6.8 ppm for 22 (Fig. 2c). On the basis of the X-ray data, the upfield signal from the carbamate 21 can be assigned to $\mathrm{H}\left(2^{\prime}\right)$ and $\mathrm{H}\left(6^{\prime}\right)$, which pass within $3 \AA$ of the face of the biaryl A-ring as the phenyl group rotates and thus experience a shielding effect. In contrast, it is clear from molecular mechanics calculations that the phenyl group in the parent amine $\mathbf{2 2}$ prefers a pseudoequatorial orientation, from where it exerts a local shielding effect on $\mathrm{H}(4)$, the upfield-shifted proton in this case. The switchable features of amines such as $\mathbf{2 2}$ should provide new opportunities for probing the edge-to-face interactions of aromatic rings. ${ }^{18}$
The key step in this approach to $\operatorname{dibenz}[c, e]$ azepines is an intramolecular direct arylation that proceeds with high atropodiastereoselectivity. The detailed mechanism of Pd-mediated arylation remains the subject of speculation, but the generally

Fig. 2 (a) Structures of 21 and 22 showing the edge-to-face interactions of the aromatic rings; (b), (c) Aromatic regions of $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{2 1}$ and $\mathbf{2 2}$ respectively.
accepted sequence ${ }^{13}$ would start with the oxidative addition of a $\operatorname{Pd}(0)$ species to the bromoaryl subunit of the substrate, and proceed to a palladacycle 23 via an electrophilic substitution (under the conditions used in Scheme 2, this may feature pivalate in a proton-transfer role ${ }^{12}$ ). The final product is formed when the palladacycle 23 undergoes reductive elimination of the Pd moiety, which returns to the catalytic cycle (Fig. 3). The stereoselectivity of this final step is essentially complete, with the ( $S$ )-configured precursor 23 being transformed into an (aS)-configured biaryl. The origin of this selectivity is ultimately the carbonyl substituent on $\mathrm{N}(6)$, whose presence causes the 5 -substituent to favour an axial orientation. Molecular mechanics calculations were used to quantify this preference in the form of the difference in steric energy $(\Delta E)$ between the respective $(5 S, \mathrm{a} S)$ and $(5 S, \mathrm{a} R)$

Fig. 3 Generalised precursor and product isomers in the catalytic cycles leading to $\mathbf{4}, \mathbf{1 4}$ and 21, with the difference in steric energy $(\Delta E)$ between the isolated product and the alternative least-strained axial invertomer (Macromodel 8.0, MM3).
conformational minima (Fig. 3). The $\Delta E$ values (12-20 $\mathrm{kJ} \mathrm{mol}^{-1}$ ) are consistent with conformational equilibria dominated ( $>99 \%$ at $25^{\circ} \mathrm{C}$ ) by the respective ( $5 S, \mathrm{a} S$ )-diastereoisomers, which behave as 'fixed axis' systems despite lacking the usual axis-restraining features, viz. substituents at $\mathrm{C}(1)$ and $\mathrm{C}(11)$ or the fusion of a 5 -membered ring to the $\mathrm{C}(5)-\mathrm{N}(6)$ bond. ${ }^{19}$

## Conclusions

We have described two variants of a new route to 5 -substituted 6,7-dihydrodibenz[ $[, e]$ azepines, a unique class of secondary amine incorporating a centre-axis chirality relay. In both variants the pivotal step is the ring closure of an $N$-acylated 1 -substituted $N$-(2-bromobenzyl)-1-phenylmethanamine via Pd-mediated intramolecular direct arylation, which proceeds with high atropodiastereoselectivity due to strain effects that can be predicted using molecular mechanics calculations. We are currently exploring the scope of these reactions in various synthetic contexts, and evaluating the potential of the dibenzazepine centre-axis relay as a mechanistic and structural tool.

## EXPERIMENTAL

Melting points were determined using a Kofler hot-stage or Stuart Scientific SMP10 apparatus and are uncorrected. IR spectra were recorded for neat thin films using Perkin-Elmer FT-IR Spectrum RX1 or BX spectrometers. NMR spectra were recorded on Bruker DPX300 or Avance 400 spectrometers and calibrated internally by reference to signals from the solvent $\left(\mathrm{CDCl}_{3}\right.$ at 77.16 ppm for ${ }^{13} \mathrm{C}$ spectra; $\mathrm{CHCl}_{3}$ at 7.26 ppm for ${ }^{1} \mathrm{H}$ spectra ${ }^{20}$ or externally (referenced to $\mathrm{CFCl}_{3}$ at 0 ppm for ${ }^{19} \mathrm{~F}$ spectra). Coupling constants ( $J$ values) are given in Hz ; multiplicities are given as singlet (s), doublet (d), triplet ( t ), quartet ( q ), quintet (qn) or multiplet (m). NMR spectra were assigned with the aid of COSY, HMBC, HMQC and DEPT spectra where appropriate. Low-resolution mass spectra were recorded on a Micromass Trio 2000 instrument using the electrospray ionisation method; data for most of the peaks of intensity $<20 \%$ of that of the base peak are omitted. Highresolution (accurate mass) data were recorded using a Thermo Finnigan MAT95XP instrument. HPLC analyses were carried out using a PE Series 200 system with Gemini ODS column $(25 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 5 \# \mathrm{x} 3 \mathrm{bc} ; \mathrm{m})$ and the following parameters: column temperature ambient; mobile phase A methanol, mobile phase B water, A : B $70: 30$; flow rate $1 \mathrm{~mL} \mathrm{~min}^{-1}$; injection volume $1 \mu \mathrm{~L}$, detection at 254 nm . Elemental analyses were carried out by the University of Manchester microanalytical services using Carlo Erba EA1108 equipment. Optical rotations were measured at 589 nm using an AA-100 polarimeter (Optical Activity Ltd.).

Reactions were routinely carried out under nitrogen. Most reagents and solvents were used as supplied commercially, including anhydrous $N, N$-dimethylacetamide (DMA; Sigma Aldrich 271012). Anhydrous THF was distilled from sodium/benzophenone ketyl immediately before use. ${ }^{21}$ Organic solutions were dried using anhydrous magnesium sulfate and concentrated by rotary evaporation. TLC was carried out using Macherey-Nagel Polygram SIL G/UV 254 plates and the chromatograms were routinely visualised using UV light ( 254 nm ) and alkaline aq. $\mathrm{KMnO}_{4}$. Preparative column (flash) chromatography was carried out on 60 H silica gel (Merck 9385) using the flash
technique. ${ }^{22}$ Compositions of solvent mixtures are quoted as ratios of volume. 'Ether' refers to diethyl ether. 'Petrol' refers to a fraction of light petroleum, b.p. $60-80^{\circ} \mathrm{C}$, unless indicated otherwise.

## (S)-N-(2-Bromobenzylidene)-1-phenylethanamine 10

To a solution of (-)-1-phenylethylamine ( $S$ )-8 $(6.45 \mathrm{~mL}, 6.14 \mathrm{~g}$, $50 \mathrm{mmol})$ in toluene ( 50 mL ) was added 2-bromobenzaldehyde $9(5.84 \mathrm{~mL}, 9.26 \mathrm{~g}, 50 \mathrm{mmol})$ followed by $p$-toluenesulfonic acid monohydrate ( $380 \mathrm{mg}, 2.0 \mathrm{mmol}$ ). The mixture was heated to $145^{\circ} \mathrm{C}$ (bath temperature) under Dean-Stark conditions for 5 h , allowed to cool to room temperature and concentrated under reduced pressure to afford the imine 10 ( $14.2 \mathrm{~g}, 98 \%$ ) as a pale yellow oil. The crude product, which was used directly in the next step, had $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.75(1 \mathrm{H}, \mathrm{s}, \mathrm{N}=\mathrm{CH}), 8.12(1 \mathrm{H}$, dd, $J 2.0,8.0 \mathrm{~Hz}, \mathrm{ArH}$ ), $7.56(1 \mathrm{H}, \mathrm{dd}, J 1.5,8.0 \mathrm{~Hz}, \mathrm{ArH}), 7.45$ ( $2 \mathrm{H}, \mathrm{d}, J 7.5 \mathrm{~Hz}, \mathrm{ArH}$ ), 7.38-7.31 (3 H, m, ArH), 7.28-7.26 (2 H, m, ArH), $4.63\left(1 \mathrm{H}, \mathrm{q}, J 6.5 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right), 1.61(3 \mathrm{H}, \mathrm{d}, J$ $\left.6.5 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 290\left(M \mathrm{H}^{+}, 100 \%\right), 288\left(M \mathrm{H}^{+}, 90\right)$ (Found: $M \mathrm{H}^{+}$288.0383; $\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{BrN}$ requires 288.0383); $R_{\mathrm{f}} 0.76$ (hexane-EtOAc, $3: 1$ ).

## (S)-N-(2-Bromobenzyl)-1-phenylethanamine 11

A solution of the crude imine $(S) \mathbf{- 1 0}(13.9 \mathrm{~g}, 48 \mathrm{mmol})$ in EtOH ( 24 mL ) was cooled to $0{ }^{\circ} \mathrm{C}$ and $\mathrm{NaBH}_{4}(2.01 \mathrm{~g}, 53 \mathrm{mmol}$ ) was added in five equal portions. On completion of the addition the solution was allowed to warm to room temperature and stirred for 18 h . The solution was concentrated under reduced pressure and the residue taken up in ether $(100 \mathrm{~mL})$. The organic solution was washed with sat. aq. $\mathrm{NaHCO}_{3}(2 \times 50 \mathrm{~mL})$ and sat. aq. $\mathrm{NaCl}(50 \mathrm{~mL})$, dried and concentrated under reduced pressure. Chromatography of the residue (hexane-EtOAc, $9: 1$ ) gave the title compound 11 ( $12.9 \mathrm{~g}, 92 \%$ ) as a colourless oil (Found: C, 61.8; H, 5.6; N, 4.8. $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{BrN}$ requires $\mathrm{C}, 62.08 ; \mathrm{H}, 5.56 ; \mathrm{N}$, $4.83 \%) ;[\alpha]_{\mathrm{D}}^{24}-51 \pm 4\left(c 1.2, \mathrm{CHCl}_{3}\right) ; v_{\max } / \mathrm{cm}^{-1}$ (film) 3058, 3020, 2963, 2924, 2863, 2840, 1491, 1465, 1450, 1440, 1121, 1025; $\delta_{\mathrm{H}}$ ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $7.54(1 \mathrm{H}, \mathrm{dd}, J 1.0,8.0 \mathrm{~Hz}, \mathrm{ArH}), 7.41-7.24$ ( $7 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ), $7.12(1 \mathrm{H}, \mathrm{td}, J 1.8,7.6 \mathrm{~Hz}, \mathrm{ArH}), 3.83(1 \mathrm{H}, \mathrm{q}, J$ 6.6 Hz, NHCHCH $)_{3}$, $3.74\left(1 \mathrm{H}, \mathrm{d}, J 13.7 \mathrm{~Hz}, \mathrm{NHCH}_{A} \mathrm{H}_{\mathrm{B}}\right), 3.69$ $\left(1 \mathrm{H}, \mathrm{d}, J 13.7 \mathrm{~Hz}, \mathrm{NHCH}_{\mathrm{A}} H_{B}\right), 1.82(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH}) 1.38(3 \mathrm{H}$, d, $\left.J 6.6 \mathrm{~Hz}, \mathrm{NHCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 145.4(\mathrm{C}), 139.6$ (C), $132.9(\mathrm{CH}), 130.7(\mathrm{CH}), 128.7(\mathrm{CH}), 128.6(\mathrm{CH}), 127.5(\mathrm{CH})$, $127.1(\mathrm{CH}), 126.9(\mathrm{CH}), 124.1(\mathrm{C}), 57.5(\mathrm{CH}), 51.8\left(\mathrm{CH}_{2}\right), 24.7$ $\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 292\left(M \mathrm{H}^{+}, 100 \%\right), 290\left(M \mathrm{H}^{+}, 92\right)$ (Found: $M \mathrm{H}^{+}$ 290.0537; $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{BrN}$ requires 290.0539); $R_{\mathrm{f}} 0.55$ (hexane-EtOAc, 3:1).

## (S)-N-(2-Bromobenzyl)-2,2,2-trifluoro- N -(1phenylethyl)acetamide 12

A solution of the amine $(S) \mathbf{- 1 1}(6.20 \mathrm{~g}, 21.4 \mathrm{mmol})$ in pyridine $(40 \mathrm{~mL})$ under nitrogen was treated with trifluoroacetic anhydride ( $3.0 \mathrm{~mL}, 4.53 \mathrm{~g}, 21.6 \mathrm{mmol}$ ) and the solution was stirred at room temperature for 24 h . The mixture was diluted with water $(100 \mathrm{~mL})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ and the layers separated. The organic layer was washed with water $(3 \times 100 \mathrm{~mL})$, dried and concentrated under reduced pressure. Chromatography of the residue (hexaneEtOAc, $9: 1)$ gave the title compound $\mathbf{1 2}(7.58 \mathrm{~g}, 92 \%)$ as a yellow crystalline solid, m.p. $52-54{ }^{\circ} \mathrm{C}$ (Found: C, $52.8 ; \mathrm{H}, 3.9$; N, 3.5.
$\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{BrF}_{3} \mathrm{NO}$ requires C, 52.87; $\left.\mathrm{H}, 3.91 ; \mathrm{N}, 3.63 \%\right) ;[\alpha]_{\mathrm{D}}^{24}-49 \pm 2$ (c 1.2, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ (film) 1681, 1448, 1197, 1183, 1133, 1078, $1027,748,728,694,670 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers a and b) $7.49(0.33 \mathrm{H}, \mathrm{dd}, J 1.0,8.0 \mathrm{~Hz}, \mathrm{ArH}$, rotamer b), $7.44(0.66 \mathrm{H}, \mathrm{dd}, J 1.0,8.0 \mathrm{~Hz}, \mathrm{ArH}$, rotamer a), 7.37-7.22 (5.33 $\mathrm{H}, \mathrm{m}, \mathrm{ArH}$, rotamers a and b), $7.18(0.66 \mathrm{H}, \mathrm{dt}, J 1.0,7.5 \mathrm{~Hz}$, ArH , rotamer a), $7.13-7.09$ ( $0.66 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$, rotamer a), 7.04 ( $0.66 \mathrm{H}, \mathrm{dt}, J 1.5,7.5 \mathrm{~Hz}, \mathrm{ArH}$, rotamer a), $6.92(0.66 \mathrm{H}, \mathrm{d}, J$ $8.0 \mathrm{~Hz}, \mathrm{ArH}$, rotamer a), $5.73\left(0.33 \mathrm{H}, \mathrm{q}, J 7.1 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer b), $5.48\left(0.66 \mathrm{H}, \mathrm{q}, J 6.9 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer a), $4.67\left(0.66 \mathrm{H}, \mathrm{d}, J 16.5 \mathrm{~Hz}, \mathrm{NCH}_{A} \mathrm{H}_{\mathrm{B}}\right.$, rotamer a), $4.62(0.33 \mathrm{H}$, d, $J 18.2 \mathrm{~Hz}, \mathrm{NCH}_{A} \mathrm{H}_{\mathrm{B}}$, rotamer b), $4.53(0.33 \mathrm{H}, \mathrm{d}, J 18.2 \mathrm{~Hz}$, $\mathrm{NCH}_{\mathrm{A}} H_{B}$, rotamer b), $4.28\left(0.66 \mathrm{H}, \mathrm{d}, J 16.5 \mathrm{~Hz}, \mathrm{NCH}_{\mathrm{A}} H_{B}\right.$, rotamer a), $1.59\left(2 \mathrm{H}, \mathrm{d}, J 6.9 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer a), 1.51 (1 $\mathrm{H}, \mathrm{d}, J 7.1 \mathrm{~Hz}, \mathrm{NCHCH}_{3}$, rotamer b); $\delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers) 158.2 (C, q, $J 35.5 \mathrm{~Hz}$, rotamer b), 157.5 (C, q, $J 35.5 \mathrm{~Hz}$, rotamer a), 138.6 (C, rotamer a), 137.7 (C, rotamer b), $135.6(\mathrm{C}$, rotamer a), $135.1(\mathrm{C}$, rotamer b), $132.7(\mathrm{CH}$, rotamer b), $132.6(\mathrm{CH}$, rotamer a), $129.0(\mathrm{CH}), 128.9(\mathrm{CH}), 128.7(\mathrm{CH})$, $128.5(\mathrm{CH}), 128.45(\mathrm{CH}), 128.3(\mathrm{CH}), 128.1(\mathrm{CH}), 127.8(\mathrm{CH})$, $127.4(\mathrm{CH}), 127.3(\mathrm{CH}), 127.29(\mathrm{CH}), 122.2(\mathrm{C}), 121.9(\mathrm{C}), 117.0$ (C, q, $J 288 \mathrm{~Hz}$, rotamer a), $116.5(\mathrm{C}, \mathrm{q}, J 289 \mathrm{~Hz}$, rotamer b), $56.0\left(\mathrm{CH}, \mathrm{q}, J 3 \mathrm{~Hz}\right.$, rotamer a), $55.9\left(\mathrm{CH}\right.$, rotamer b), $48.2\left(\mathrm{CH}_{2}\right.$, q, $J 3 \mathrm{~Hz}$, rotamer b), $46.8\left(\mathrm{CH}_{2}\right.$, rotamer a), $18.0\left(\mathrm{CH}_{3}\right.$, rotamer a), $17.2\left(\mathrm{CH}_{3}\right.$, rotamer b); $\delta_{\mathrm{F}}\left(376.5 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers) $-67.5(2 \mathrm{~F}, \mathrm{~s}$, rotamer a), $-68.8(1 \mathrm{~F}, \mathrm{~s}$, rotamer b$)$; $m / z\left(\mathrm{ES}^{+}\right) 410\left(M \mathrm{Na}^{+}, 43 \%\right), 408\left(M \mathrm{Na}^{+}, 45\right)$ (Found: $M \mathrm{Na}^{+}$ 408.0181; $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{BrF}_{3} \mathrm{NONa}$ requires 408.0182); $R_{\mathrm{f}} 0.74$ (hexaneEtOAc, $3: 1$ ); HPLC $t_{R} 40.0 \mathrm{~min}$.

## 1-[(aS,5S)-5,7-Dihydro-5-methyl-6H-dibenz[ $[$, e $]$ azepin- $6-\mathrm{yl}]$ -2,2,2-trifluoroethanone (-)-14

To a solution of $(S) \mathbf{- 1 2}(1.43 \mathrm{~g}, 3.7 \mathrm{mmol})$ in DMA ( 25 mL ) under nitrogen was added anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}(1.03 \mathrm{~g}, 7.4 \mathrm{mmol})$ followed by $\mathrm{Pd}(\mathrm{OAc})_{2}(83 \mathrm{mg}, 0.37 \mathrm{mmol})$ and DavePhos 13 ( $146 \mathrm{mg}, 0.37 \mathrm{mmol}$ ), and the mixture was heated to $145{ }^{\circ} \mathrm{C}$ (bath temperature) for 24 h . The mixture was allowed to cool to room temperature, diluted with ether ( 25 mL ) and sat. aq. NaCl $(65 \mathrm{~mL})$ and the layers separated. The organic layer was washed with sat. aq. $\mathrm{NaCl}(5 \times 65 \mathrm{~mL})$, dried and concentrated under reduced pressure. The residual brown oil was chromatogaphed over silica gel (hexane-EtOAc, 19:1), affording the title compound 14 ( $679 \mathrm{mg}, 60 \%$ ) as an off-white solid, m.p. $114-116^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}^{25}-301$ $\pm 10\left(c 0.6, \mathrm{CHCl}_{3}\right) ; v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right) 3011,1711,1679,1443$, 1188,$1159 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)(9: 1$ mixture of rotamers) $7.61-$ $7.50(4 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$, rotamers a and b), 7.46-7.28 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$, rotamers a and b), $5.44(0.9 \mathrm{H}, \mathrm{q}, J 7.0 \mathrm{~Hz}, 5-\mathrm{H}$, rotamer a), 5.26 $\left(0.1 \mathrm{H}, \mathrm{d}, J 14.0 \mathrm{~Hz}, 7-\mathrm{H}_{\mathrm{eq}}\right.$, rotamer b), $5.16(0.1 \mathrm{H}$, br q, $J 7.0 \mathrm{~Hz}$, $5-\mathrm{H}$, rotamer b), $4.76\left(0.9 \mathrm{H}, \mathrm{dd}, J 1.0,14.0 \mathrm{~Hz}, 7-\mathrm{H}_{\mathrm{eq}}\right.$, rotamer a), $4.12\left(0.9 \mathrm{H}, \mathrm{d}, J 14.0 \mathrm{~Hz}, 7-\mathrm{H}_{\mathrm{ax}}\right.$, rotamer a), $3.83(0.1 \mathrm{H}, \mathrm{d}, J$ $14.0 \mathrm{~Hz}, 7-\mathrm{H}_{\mathrm{ax}}$, rotamer b), $0.97(0.3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}, 5-\mathrm{Me}$, rotamer b), $0.92\left(2.7 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}, 5-\mathrm{Me}\right.$, rotamer a); $\delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right)(9: 1$ mixture of rotamers, quoted signals for rotamer a only) 154.2 (C, q, $J 35.5 \mathrm{~Hz}$ ), 140.9 (C), 138.9 (C), 137.3 (C), 132.4 $(\mathrm{C}), 130.6(\mathrm{CH}), 129.8(\mathrm{CH}), 129.6(\mathrm{CH}), 129.1(\mathrm{CH}), 128.8(\mathrm{CH})$, $128.68(\mathrm{CH}), 128.67(\mathrm{CH}), 127.8(\mathrm{CH}), 116.8(\mathrm{C}, \mathrm{q}, J 287.5 \mathrm{~Hz})$, $58.5(\mathrm{CH}), 48.1\left(\mathrm{CH}_{2}, \mathrm{q}, J 3.5 \mathrm{~Hz}\right), 19.9\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}\left(\mathrm{ES}^{+}\right) 328$
( $M \mathrm{Na}^{+}, 100 \%$ ) (Found: $M \mathrm{Na}^{+} 328.0920 ; \mathrm{C}_{17} \mathrm{H}_{14} \mathrm{~F}_{3} \mathrm{NONa}$ requires 328.0920); $R_{\mathrm{f}} 0.72$ (hexane-EtOAc, $3: 1$ ); HPLC $t_{R} 29.0 \mathrm{~min}$.

## Variation of conditions for Pd-catalysed ring closure

Five experiments were run using the procedure described for the preparation of $\mathbf{1 4}$ (above), using the amide $\mathbf{1 2}$ ( 1 mol equiv.) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ (2 mol equiv.) and one of five different catalytic conditions (Table 1). Each solution was heated for 24 h at $145^{\circ} \mathrm{C}$, allowed to cool, diluted with ether ( 5 mL ) and quenched with sat. aq. $\mathrm{NaCl}(15 \mathrm{~mL})$. The ether layer was washed with sat. aq. $\mathrm{NaCl}(5 \times$ 15 mL ), dried, filtered and evaporated under reduced pressure. The residue was then diluted with $\mathrm{MeOH}(c a .5 \mathrm{~mL})$ and analysed by HPLC.

## (aR,5S)-6,7-Dihydro-5-methyl-5H-dibenz[c,e]azepine (+)-2

A solution of the amide 14 ( $679 \mathrm{mg}, 2.22 \mathrm{mmol}$ ) in MeOH $(40 \mathrm{~mL})$ under argon was treated with $\mathrm{K}_{2} \mathrm{CO}_{3}(1.34 \mathrm{~g}, 9.70 \mathrm{mmol})$ followed by water $(100 \mathrm{~mL})$, and the mixture was stirred at $60^{\circ} \mathrm{C}$ for 24 h . After cooling to room temperature, the mixture was diluted with water ( 200 mL ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$. The layers were then separated, the aqueous layer was extracted with more $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$ and the combined organic phase was dried and evaporated. The residual yellow oil was purified by chromatography over silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}, 9: 1\right)$, giving the amine $2(450 \mathrm{mg}, 97 \%)$ as a colourless oil, $[\alpha]_{\mathrm{D}}^{22}+27.0\left(c 0.8, \mathrm{CHCl}_{3}\right)$ $\left\{\right.$ lit. ${ }^{1}$ for $\left.(5 R)-2[\alpha]_{\mathrm{D}}^{25}-23.5 \pm 1\left(c 0.65, \mathrm{CHCl}_{3}\right)\right\} ; v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right)$ 3068, 3009, 2965, 2926, 1481, 1451, 1379, 1112; $\delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.50-7.34(8 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 3.75(1 \mathrm{H}, \mathrm{d}, J 12.5 \mathrm{~Hz}, 7-\mathrm{H})$, $3.73(1 \mathrm{H}, \mathrm{q}, J 6.5 \mathrm{~Hz}, 5-\mathrm{H}), 3.51(1 \mathrm{H}, \mathrm{d}, J 12.5 \mathrm{~Hz}, 7-\mathrm{H}), 2.23$ ( 1 H , br s, NH), 1.49 ( $3 \mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz}, 5-\mathrm{Me}$ ); $\delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 141.33(\mathrm{C}), 141.29(\mathrm{C}), 139.3(\mathrm{C}), 137.0(\mathrm{C}), 128.5(\mathrm{CH})$, $128.25(\mathrm{CH}), 128.2(\mathrm{CH}), 128.1(\mathrm{CH}), 128.08(\mathrm{CH}), 127.8(\mathrm{CH})$, $127.6(\mathrm{CH}), 125.0(\mathrm{CH}), 50.3(\mathrm{CH}), 49.5\left(\mathrm{CH}_{2}\right), 19.0\left(\mathrm{CH}_{3}\right)$; $m / z\left(\mathrm{ES}^{+}\right) 210\left(M \mathrm{H}^{+}, 100 \%\right)$ (Found: $M \mathrm{H}^{+} 210.1277 ; \mathrm{C}_{15} \mathrm{H}_{16} \mathrm{~N}$ requires 210.1278); $R_{\mathrm{f}} 0.01$ (hexane-EtOAc, 3:1), 0.73 (EtOAc$\left.\mathrm{MeOH} / \mathrm{Et}_{3} \mathrm{~N}, 80: 20: 1\right), 0.27\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}, 9: 1\right)$. The sample of (+)-2 was identical (TLC, ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR) to an authentic sample of (-)-2 obtained as described. ${ }^{1}$

## (S)-N-(2-Bromobenzyl)-2,2,2-trifluoro-N-(1phenylethyl)acetamide 15

To a solution of 1-phenylethylamine $( \pm) \mathbf{- 8}(0.15 \mathrm{~mL}, 143 \mathrm{mg}$, $1.2 \mathrm{mmol})$ in toluene $(15 \mathrm{~mL})$ was added benzaldehyde $(0.12 \mathrm{~mL}$, $125 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) followed by $p$-toluenesulfonic acid monohydrate $(20 \mathrm{mg}, 0.11 \mathrm{mmol})$ and powdered $4 \AA$ molecular sieves
$(2 \mathrm{~g})$. The mixture was heated to $145^{\circ} \mathrm{C}$ (bath temperature) for 5 h , allowed to cool to room temperature and filtered through Celite. Concentration of the filtrate under reduced pressure gave the imine $( \pm)$ - $N$-benzylidene-1-phenylethanamine $\mathbf{A}$ as a pale yellow oil, $\delta_{\mathrm{H}}$ ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $8.38(1 \mathrm{H}, \mathrm{s}, \mathrm{N}=\mathrm{CH}), 7.81-7.76(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$, $7.46-7.25(8 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.55\left(1 \mathrm{H}, \mathrm{q}, J 6.5 \mathrm{~Hz}, \mathrm{CHCH}_{3}\right), 1.60(3$ $\mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz}, \mathrm{Me})\left\{\mathrm{lit}^{23} \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.38(1 \mathrm{H}, \mathrm{s}), 4.56\right.$ $(1 \mathrm{H}, \mathrm{q}, J 6.6 \mathrm{~Hz}), 1.60(3 \mathrm{H}, \mathrm{d}, J 6.7 \mathrm{~Hz})\} ; R_{\mathrm{f}} 0.73$ (hexane-EtOAc, $3: 1$ ). A solution of the crude $\mathbf{A}$ in $\mathrm{EtOH}(5 \mathrm{~mL})$ was treated with $\mathrm{NaBH}_{4}(62 \mathrm{mg}, 1.6 \mathrm{mmol})$ and stirred at room temperature for 18 h . The solution was concentrated and the residue taken up in ether $(20 \mathrm{~mL})$. The organic solution was washed with sat. aq. $\mathrm{NaHCO}_{3}(3 \times 15 \mathrm{~mL})$, dried and concentrated. Chromatography of the residue (hexane-EtOAc, $9: 1$ ) gave the amine ( $\pm$ )- $N$-benzyl-1-phenylethanamine B ( $164 \mathrm{mg}, 66 \%$ ) as a colourless oil, $v_{\max } / \mathrm{cm}^{-1}$ (film) 3083, 3060, 3024, 2962, 2923, 1492, 1452, 1369, 1126, 1028, $761,735,699 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.38-7.22(10 \mathrm{H}, \mathrm{m}, \mathrm{Ar} H)$, $3.82\left(1 \mathrm{H}, \mathrm{q}, J 6.6 \mathrm{~Hz}, \mathrm{NHCHCH}_{3}\right), 3.66(1 \mathrm{H}, \mathrm{d}, J 13.1 \mathrm{~Hz}$, $\left.\mathrm{NHCH}_{A} \mathrm{H}_{\mathrm{B}}\right), 3.60\left(1 \mathrm{H}, \mathrm{d}, J 13.1 \mathrm{~Hz}, \mathrm{NHCH}_{\mathrm{A}} H_{B}\right), 1.59(1 \mathrm{H}$, br s, NH) $1.37\left(3 \mathrm{H}, \mathrm{d}, J 6.6 \mathrm{~Hz}, \mathrm{NHCHCH}_{3}\right) ; \delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 145.7(\mathrm{C}), 140.8(\mathrm{C}), 128.6(\mathrm{CH}), 128.5(\mathrm{CH}), 128.3(\mathrm{CH})$, $127.1(\mathrm{CH}), 127.0(\mathrm{CH}), 126.8(\mathrm{CH}), 57.6(\mathrm{CH}), 51.8\left(\mathrm{CH}_{2}\right), 24.7$ $\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 212\left(\mathrm{MH}^{+}, 100 \%\right) ; R_{\mathrm{f}} 0.29$ (hexane-EtOAc, 3:1). The above ${ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}$-NMR spectra of $\mathbf{B}$ are in accord with published data. ${ }^{24}$ A solution of the amine $( \pm)$-B ( 164 mg , $0.78 \mathrm{mmol})$ in pyridine $(1 \mathrm{~mL})$ under nitrogen was treated with trifluoroacetic anhydride ( $0.12 \mathrm{~mL}, 181 \mathrm{mg}, 0.86 \mathrm{mmol}$ ) and the solution was stirred at room temperature for 24 h . The mixture was diluted with water $(10 \mathrm{~mL})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ and the layers separated. The organic layer was washed with water $(3 \times 15 \mathrm{~mL})$, dried and concentrated under reduced pressure. Chromatography of the residue (hexane-EtOAc, $9: 1$ ) gave the title compound $\mathbf{1 5}$ ( $153 \mathrm{mg}, 64 \%$ ) as a colourless oil, $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right) 1688,1496$, $1451,1202,1140,753,697 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers) $7.3-6.9(10 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 5.49(0.33 \mathrm{H}, \mathrm{q}, J 7.2 \mathrm{~Hz}$, $\mathrm{NCHCH}_{3}$, rotamer b), $5.34\left(0.66 \mathrm{H}, \mathrm{q}, J 6.9 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer a), $4.57\left(0.66 \mathrm{H}, \mathrm{d}, J 15.3 \mathrm{~Hz}, \mathrm{NCH}_{A} \mathrm{H}_{\mathrm{B}}\right.$, rotamer a), $4.55\left(0.33 \mathrm{H}, \mathrm{d}, J 17.0 \mathrm{~Hz}, \mathrm{NCH}_{A} \mathrm{H}_{\mathrm{B}}\right.$, rotamer b), $4.22(0.33 \mathrm{H}$, d, $J 17.0 \mathrm{~Hz}, \mathrm{NCH}_{\mathrm{A}} H_{B}$, rotamer b), $3.93(0.66 \mathrm{H}, \mathrm{d}, J 15.3 \mathrm{~Hz}$, $\mathrm{NCH}_{\mathrm{A}} H_{B}$, rotamer a), $1.47\left(2 \mathrm{H}, \mathrm{d}, J 6.9 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer a), $1.33\left(1 \mathrm{H}, \mathrm{d}, J 7.2 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right.$, rotamer b); $\delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers) $158.2(\mathrm{C}, \mathrm{q}, J 35.5 \mathrm{~Hz}$, rotamer b), 157.7 (C, q, $J 35.5 \mathrm{~Hz}$, rotamer a), 138.7 (C, rotamer b), 138.0 (C, rotamer a), 136.9 (C, rotamer a), 136.3 (C, rotamer b), 129.0 $(\mathrm{CH}), 128.7(\mathrm{CH}), 128.5(\mathrm{CH}), 128.45(\mathrm{CH}), 128.2(\mathrm{CH}), 127.9$ $(\mathrm{CH}), 127.85(\mathrm{CH}), 127.5(\mathrm{CH}), 127.4(\mathrm{CH}), 127.3(\mathrm{CH}), 127.2$ (C), 117.1 (C, q, J 288 Hz , rotamer a), 116.7 (C, q, J 289 Hz , rotamer b), $56.1(\mathrm{CH}$, rotamer b), $55.9(\mathrm{CH}, \mathrm{q}, J 3 \mathrm{~Hz}$, rotamer a), $48.8\left(\mathrm{CH}_{2}, \mathrm{q}, J 3 \mathrm{~Hz}\right.$, rotamer b), $47.0\left(\mathrm{CH}_{2}\right.$, rotamer a), $18.3\left(\mathrm{CH}_{3}\right.$, rotamer a), $17.2\left(\mathrm{CH}_{3}\right.$, rotamer b); $\delta_{\mathrm{F}}(376.5 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right)(2: 1$ mixture of rotamers $)-67.5(2 \mathrm{~F}, \mathrm{~s}$, rotamer a), -68.0 ( 1 F , s, rotamer b); $m / z\left(\mathrm{ES}^{+}\right) 330\left(M \mathrm{Na}^{+}, 100 \%\right), 308\left(M \mathrm{H}^{+}, 11\right)$ (Found: $M \mathrm{Na}^{+} 308.1250 ; \mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~F}_{3} \mathrm{NO}$ requires 308.1257); $R_{\mathrm{f}} 0.65$ (hexane-EtOAc, $3: 1$ ); HPLC $t_{R} 25.5 \mathrm{~min}$.

## (S)-t-Butyl $N$-(1-phenylethyl)carbamate 16

A solution of the amine $(S)-\mathbf{8}(4.848 \mathrm{~g}, 40 \mathrm{mmol})$ in EtOH $(20 \mathrm{~mL})$ was vigorously stirred and cooled in ice-water during
the addition a solution of di-t-butyl dicarbonate $(9.60 \mathrm{~g}, 44 \mathrm{mmol})$ in EtOH ( 40 mL ). ${ }^{25}$ Effervescence and warming occurred almost immediately. After the addition the cooling bath was removed and stirring was continued at room temperature for 0.5 h . The mixture was then evaporated in vacuo and the residual white solid crystallised from ether ( 30 mL ), giving the known carbamate $\mathbf{1 6}$ $(5.66 \mathrm{~g}, 64 \%)$ as colourless rhombs, m.p. $88-89^{\circ} \mathrm{C}\left(\right.$ lit. ${ }^{25} 87-88^{\circ} \mathrm{C}$ ). Evaporation of the mother liquors and recrystallisation of the residue from ether ( 12 mL ) gave a second crop of $\mathbf{1 6}(1.74 \mathrm{~g}, 20 \%)$ (total $7.40 \mathrm{~g}, 84 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ (film) 3380,$1685 ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.36-7.21(5 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.79(2 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{MeCH}$ and NH), 1.49-1.35 ( 12 H , br s, Me and $\mathrm{CMe}_{3}$ ); $\delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $155.2(\mathrm{C}), 155.1(\mathrm{C}), 128.7(\mathrm{CH}), 127.2(\mathrm{CH}), 126.0(\mathrm{CH}), 79.6$ (C), $50.3(\mathrm{CH}), 28.5\left(\mathrm{CH}_{3}\right), 22.8\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 244\left(M \mathrm{Na}^{+}\right.$, $100 \%$ ); $R_{\mathrm{f}} 0.49$ (hexane-EtOAc, $4: 1$ ).

## (S)-t-Butyl $N$-(1-phenylethyl)- $N$-I(2bromophenyl)methyl]carbamate 18

In a 100 mL two-necked flask fitted with a stirrer bar, nitrogen inlet and septum cap, a portion of $\mathrm{NaH}(60 \%$ dispersion in mineral oil, $500 \mathrm{mg}, 12.5 \mathrm{mmol}$ ) was freed from oil by decantation with hexane $(5 \mathrm{~mL})$ and covered with dry DMF $(10 \mathrm{~mL}) .{ }^{16}$ With stirring and cooling to $5-10^{\circ} \mathrm{C}$, a solution of the carbamate $\mathbf{1 6}$ $(2.66 \mathrm{~g}, 12.0 \mathrm{mmol})$ in dry DMF $(20 \mathrm{~mL})$ was quickly added. The mixture was stirred for 5 min at $5-10{ }^{\circ} \mathrm{C}$ followed by 30 min at room temperature, and then treated with a solution of 2bromobenzyl bromide $17(3.21 \mathrm{~g}, 12.8 \mathrm{mmol})$ in dry DMF ( 4 mL ). A beige solution slowly formed and stirring was continued at room temperature for 20 h . The solution was then evaporated in vacuo and the residual oil partitioned between EtOAc ( 40 mL ) and water ( 40 mL ). The layers were separated, the aqueous phase was extracted with $\mathrm{EtOAc}(2 \times 20 \mathrm{~mL})$ and the combined organic phase was washed with sat. aq. $\mathrm{NaCl}(25 \mathrm{~mL})$, dried and evaporated. The residual oil ( 4.62 g ) was dissolved in hot hexane ( 20 mL ). On cooling, the solution provided a portion of unreacted 16 ( $250 \mathrm{mg}, 5 \%$ ) as colourless crystals, m.p. $87-89^{\circ} \mathrm{C}$. Evaporation of the mother liquors gave an oil which was purified by flash chromatography ( $\mathrm{h} 10 \mathrm{~cm}, \mathrm{~d} 4.5 \mathrm{~cm}$; hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 2$ ), giving the title compound $\mathbf{1 8}(2.72 \mathrm{~g}, 58 \%)$ as a colourless oil; $[\alpha]_{\mathrm{D}}^{24}-50.5 \pm$ 1.5 (c $1.28, \mathrm{CHCl}_{3}$ ); $v_{\max } / \mathrm{cm}^{-1}$ (film) 2973, 1685, 1439, 1395, 1363, $1325,1274,1251,1212,1160,1133,1043,1024,992,861,745,697$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.46(1 \mathrm{H}, \mathrm{dd}, J 1,8 \mathrm{~Hz}, \mathrm{ArH}), 7.38-7.29$ $(4 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.27-7.14(3 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.05(1 \mathrm{H}, \mathrm{dt}, J 2,8 \mathrm{~Hz}$, $\mathrm{ArH})$, 5.71 ( 0.6 H , br s, CHMe, rotamer a), $5.30(0.4 \mathrm{H}$, br s, CHMe, rotamer b), 4.69-4.07 ( 2 H , br m, $\mathrm{CH}_{2}$ ), $1.46(3 \mathrm{H}, \mathrm{d}, J$ $7 \mathrm{~Hz}, \mathrm{Me}), 1.38\left(9 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{3}\right) ; \delta_{\mathrm{C}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 156.1(\mathrm{C})$, $141.8(\mathrm{C}), 138.6(\mathrm{C}), 132.4(\mathrm{CH}), 128.5(2 \times \mathrm{CH}), 128.0(\mathrm{CH})$, $127.3(\mathrm{CH}), 127.2(2 \times \mathrm{CH}), 122.2(\mathrm{C}), 80.3(\mathrm{C}), 53.5(\mathrm{CH}), 47.2$ $\left(\mathrm{CH}_{2}\right), 28.4\left(\mathrm{CH}_{3}\right), 17.7\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 414\left(M \mathrm{Na}^{+}, 100 \%\right), 412$ ( $M \mathrm{Na}^{+}$, 92) (Found: $M \mathrm{Na}^{+} 412.0894 ; \mathrm{C}_{20} \mathrm{H}_{24} \mathrm{BrNNaO}_{2}$ requires 412.0883); $R_{\mathrm{f}} 0.40$ (hexane-EtOAc, $12: 1$ ), 0.25 (hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, $1: 2), 0.75\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$.

## (aS,5S)-t-Butyl 5-phenyl-5H-dibenz[c,e]azepine-6(7H)-carboxylate (-)-4

A 100 mL round-bottomed flask was charged with (-)-18 (814 mg, 2.09 mmol ), anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}(432 \mathrm{mg}, 3.13 \mathrm{mmol})$, tricyclo-
hexylphosphonium tetrafluoroborate ( $77 \mathrm{mg}, 0.21 \mathrm{mmol}$ ), pivalic $\operatorname{acid}(64 \mathrm{mg}, 0.63 \mathrm{mmol})$ and $\mathrm{Pd}(\mathrm{OAc})_{2}(24 \mathrm{mg}, 0.107 \mathrm{mmol})$ and a stirrer bar. The flask was purged with nitrogen for 20 min , DMA $(20 \mathrm{~mL})$ was added, and the stirred mixture was heated to $130^{\circ} \mathrm{C}$ (bath temperature). After 72 h at $130^{\circ} \mathrm{C}$ the DMA was evaporated in vacuo and the black residue was digested with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ and filtered. The filtrate was concentrated and the residual oil purified by chromatography ( $\mathrm{h} 5 \mathrm{~cm}, \mathrm{~d} 4.5 \mathrm{~cm} ; \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ), giving the title compound 4 ( $321 \mathrm{mg}, 50 \%$ ) as a colourless oil; $[\alpha]_{\mathrm{D}}^{24}-322 \pm 9$ (c $\left.0.61, \mathrm{CHCl}_{3}\right)\left\{\right.$ lit. ${ }^{1}$ for $\left.5 R-4[\alpha]_{\mathrm{D}}^{25}+321 \pm 10\left(c 0.82, \mathrm{CHCl}_{3}\right)\right\}$; $v_{\max } / \mathrm{cm}^{-1}$ (film) $2972,1681,1397,1361,1156,1117,1038,868$, $761,752,736 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.55-7.33(8 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$, $5.12^{\mathrm{a}}(1 \mathrm{H}$, br s, $5-\mathrm{H})$, ca. $5.0^{\mathrm{a}}(1 \mathrm{H}$, br s, $7-\mathrm{H}), 3.73(2 \mathrm{H}$, br d, $J$ $11.9 \mathrm{~Hz}, 7-\mathrm{H}), 1.55\left(9 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{3}\right), 0.88(3 \mathrm{H}, \mathrm{d}, J 6.9 \mathrm{~Hz}, \mathrm{Me})$; $\delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 153.7(\mathrm{C}), 141.0(\mathrm{C}), 139.2(2 \times \mathrm{C}), 135.3$ $(\mathrm{C}), 130.2(\mathrm{CH}), 129.7(\mathrm{CH}), 129.2(\mathrm{CH}), 128.6(\mathrm{CH}), 128.3(\mathrm{CH})$, $128.2(2 \times \mathrm{CH}), 127.6(\mathrm{CH}), 79.8(\mathrm{C}), 57.7(\mathrm{CH}), 47.3$ and 46.6 (both br, 7- $\mathrm{CH}_{2}$, rotamers), $28.7\left(\mathrm{CH}_{3}\right), 21.5\left(\mathrm{br}, \mathrm{CH}_{3}\right) ; R_{\mathrm{f}} 0.50$ $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$.

## (aR,5S)-6,7-Dihydro-5-methyl-5H-dibenz[c,e]azepine (+)-2

To a solution of ( - )-4 ( $309 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in THF ( 3 mL ) was added $85 \%$ aq. phosphoric acid ${ }^{17}(2.0 \mathrm{~mL}, 29 \mathrm{mmol})$ at room temperature. The mixture was vigorously stirred at room temperature for 72 h , then diluted with water $(10 \mathrm{~mL})$, cooled to $0^{\circ} \mathrm{C}$ and basified to pH 11 by the dropwise addition of 10 M aq. $\mathrm{KOH}(\geq 9 \mathrm{~mL})$. After warming to room temperature, the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$. The combined organic extract was washed with brine ( 15 mL ), dried and concentrated under reduced pressure to give the title compound $(+)-\mathbf{2}(181 \mathrm{mg}, 87 \%)$ as a colourless oil; $[\alpha]_{D}^{24}+30.3 \pm 1.4\left(c 1.05, \mathrm{CHCl}_{3}\right)$. The material was identical (TLC, ${ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ) to that obtained from (-)-14 as described above.

## $t$-Butyl N -(diphenylmethyl)carbamate 19

A solution of diphenylmethylamine ( $7.34 \mathrm{~g}, 40 \mathrm{mmol}$ ) in EtOH $(20 \mathrm{~mL})^{25}$ was vigorously stirred and cooled in ice-water during the addition a solution of di-t-butyl dicarbonate $(9.60 \mathrm{~g}, 44 \mathrm{mmol})$ in $\mathrm{EtOH}(40 \mathrm{~mL})$. A white precipitate formed almost immediately, accompanied by effervescence and warming. After the addition the cooling bath was removed and stirring was continued at room temperature for 0.5 h . The mixture was then heated to dissolve the precipitate and left to cool. The resulting crystalline mass was collected on a Buchner funnel, rinsed with a small amount of icecold EtOH and dried, first by suction and then in vacuo, giving the carbamate 19 ( $8.11 \mathrm{~g}, 72 \%$ ) as colourless needles, m.p. $122-124^{\circ} \mathrm{C}$ (lit. $.^{26} 120.5-121.5{ }^{\circ} \mathrm{C}$ ). Evaporation of the mother liquors and recrystallisation of the residue from $\mathrm{EtOH}(15 \mathrm{~mL})$ gave a second crop of $19(2.17 \mathrm{~g}, 19 \%)$ (total $10.28 \mathrm{~g}, 91 \%) ; v_{\max } / \mathrm{cm}^{-1}$ (film) 3370, 1686; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.35-7.30(4 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.28-7.23$ ( $6 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ), $5.92(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CH}), 5.17(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH}), 1.45(9$ H , br s, $\mathrm{CMe}_{3}$ ) (in accord with published data ${ }^{26}$ ); $\delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 155.2(\mathrm{C}), 142.2(\mathrm{C}), 128.7(\mathrm{CH}), 127.5(\mathrm{CH}), 127.4(\mathrm{CH})$, $80.0(\mathrm{C}), 58.6(\mathrm{CH}), 28.5\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 306\left(M \mathrm{Na}^{+}, 100 \%\right) ; R_{\mathrm{f}}$ 0.45 (hexane-EtOAc, $4: 1$ ), 0.24 (hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 2$ ).

## $t$-Butyl $N$-(diphenylmethyl)- $N$-[(2-bromophenyl)methyl]carbamate 20

In a 100 mL two-necked flask fitted with a stirrer bar, nitrogen inlet and septum cap, a portion of $\mathrm{NaH}(60 \%$ dispersion in mineral oil, $515 \mathrm{mg}, 12.9 \mathrm{mmol}$ ) was freed from oil by decantation with hexane ( 5 mL ) and covered with dry DMF $(10 \mathrm{~mL}) .{ }^{16}$ With stirring and cooling to $5-10^{\circ} \mathrm{C}$, a solution of the carbamate 19 ( 3.40 g , $12.0 \mathrm{mmol})$ in dry DMF $(20 \mathrm{~mL})$ was quickly added. The mixture was stirred for 5 min at $5-10{ }^{\circ} \mathrm{C}$ followed by 30 min at room temperature, and then treated with a solution of 2-bromobenzyl bromide $17(3.08 \mathrm{~g}, 12.3 \mathrm{mmol})$ in dry DMF $(4 \mathrm{~mL})$. A pale yellow solution slowly formed and stirring was continued at room temperature for 20 h . The solution was then evaporated in vacuo and the residual oil partitioned between EtOAc ( 40 mL ) and water ( 40 mL ). The layers were separated, the aqueous phase was extracted with EtOAc $(2 \times 20 \mathrm{~mL})$ and the combined organic phase was washed with sat. aq. $\mathrm{NaCl}(25 \mathrm{~mL})$, dried and evaporated. The residual oil ( 5.62 g ) was dissolved in hot EtOAc ( 5 mL ) and the solution diluted with hot hexane $(15 \mathrm{~mL})$. On cooling, the solution provided a portion of unreacted $19(460 \mathrm{mg}, 12 \%)$ as colourless needles, m.p. $121-123^{\circ} \mathrm{C}$. Evaporation of the mother liquors gave a pale yellow oil which was purified by flash chromatography ( h $10 \mathrm{~cm}, \mathrm{~d} 4.5 \mathrm{~cm}$; hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 2$ ), giving the title compound $20(4.32 \mathrm{~g}, 80 \%)$ as a colourless viscous oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2973, $1690,1439,1390,1364,1272,1250,1155,1103,1024,892,745$, 696; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.31(1 \mathrm{H}, \mathrm{dd}, J 1,8 \mathrm{~Hz}, \mathrm{ArH}), 7.28-$ $7.17(10 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.04(1 \mathrm{H}, \mathrm{brt}, J 7 \mathrm{~Hz}, \mathrm{ArH}), 6.92(1 \mathrm{H}, \mathrm{dd}, J$ $1.5,8 \mathrm{~Hz}, \mathrm{ArH}), 6.87(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{ArH}), 6.66\left(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CHPh}_{2}\right), 4.57$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 1.35\left(9 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{3}\right) ; \delta_{\mathrm{C}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 156.2$ (C), 139.8 (C), 137.5 (C), $132.0(\mathrm{CH}), 128.9(\mathrm{CH}), 128.4(\mathrm{CH})$, $128.1(\mathrm{CH}), 127.7(\mathrm{CH}), 127.4(\mathrm{CH}), 126.7(\mathrm{CH}), 122.0(\mathrm{C}), 80.6$ (C), $64.0(\mathrm{CH}), 49.0\left(\mathrm{CH}_{2}\right), 28.3\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 476\left(\mathrm{MNa}^{+}\right.$, $100 \%$ ), $474\left(M \mathrm{H}^{+}, 95\right)$ (Found: $M \mathrm{Na}^{+} 474.1054 ; \mathrm{C}_{25} \mathrm{H}_{26} \mathrm{BrNNaO}_{2}$ requires 474.1040 ); $R_{\mathrm{f}} 0.40$ (hexane-EtOAc, $12: 1$ ), 0.35 (hexane$\mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 2$ ).

## $\boldsymbol{t}$-Butyl 5-phenyl-5H-dibenz[c,e]azepine-6(7H)-carboxylate 21

A 100 mL round-bottomed flask was charged with $\mathbf{2 0}$ ( 1.415 g , 3.13 mmol ), anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}(648 \mathrm{mg}, 4.69 \mathrm{mmol})$, tricyclohexylphosphonium tetrafluoroborate ( $115 \mathrm{mg}, 0.31 \mathrm{mmol}$ ), pivalic acid $(96 \mathrm{mg}, 0.94 \mathrm{mmol})$ and $\mathrm{Pd}(\mathrm{OAc})_{2}(35 \mathrm{mg}, 0.155 \mathrm{mmol})$ and a stirrer bar. The flask was purged with nitrogen for 20 min , DMA ( 30 mL ) was added, and the stirred mixture was heated to $130{ }^{\circ} \mathrm{C}$ (bath temperature). The reaction mixture became yelloworange as the bath temperature approached $130^{\circ} \mathrm{C}$. After 72 h at $130^{\circ} \mathrm{C}$ the DMA was evaporated in vacuo and the black residue was digested with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL})$ and filtered. The filtrate was concentrated and the residual oil purified by chromatography (h 6 $\mathrm{cm}, \mathrm{d} 4.5 \mathrm{~cm} ; \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ), which gave the title compound $21(833 \mathrm{mg}$, $72 \%$ ) as a pale yellow solid after trituration with ether/hexane (1:1). Crystallisation from ethanol gave the analytical sample as colourless cubes, m.p. $169-171^{\circ} \mathrm{C}$ (Found: C, 80.95; H, 6.84; N, 3.78. $\mathrm{C}_{25} \mathrm{H}_{25} \mathrm{NO}_{2}$ requires C, $80.83 ; \mathrm{H}, 6.78 ; \mathrm{N}, 3.77 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ (film) 2973, 1684, 1397, 1361, 1168, 1157, 1129, 1117, 903, 870, $745,735,697,637,599 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)($ mixture of rotamers a and b , ratio $=c a .3: 2) 7.58(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{ArH}), 7.51-7.30(4 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}), 7.21(1 \mathrm{H}, \mathrm{t}, J 7.3 \mathrm{~Hz}, \mathrm{ArH}), 7.14(1 \mathrm{H}, \mathrm{t}, J 7.3 \mathrm{~Hz}, \mathrm{ArH})$,
7.05 ( $1 \mathrm{H}, \mathrm{dd}, J 1.0,7.5 \mathrm{~Hz}, \mathrm{ArH}), 6.89-6.83$ ( $3 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ), 6.54 $6.59(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 6.44(0.4 \mathrm{H}$, br s, $5-\mathrm{H}$, rotamer b), $6.24(0.6 \mathrm{H}$, br s, $5-\mathrm{H}$, rotamer a), $5.21(0.6 \mathrm{H}$, br s, $7-\mathrm{H}$, rotamer a), $5.04(0.4$ H , br s, $7-\mathrm{H}$, rotamer b), $3.91(0.6 \mathrm{H}$, br s, $7-\mathrm{H}$, rotamer a), 3.89 ( 0.4 H , br s, $7-\mathrm{H}$, rotamer b), 1.58 ( 3.5 H , br s, $\mathrm{CMe}_{3}$, rotamer b), $1.38\left(5.5 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CMe}_{3}\right.$, rotamer a); $\delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ (major and minor rotamers, pairings tentative) $154.5(\mathrm{C}), 142.5$ (br, C, major), 141.8 (br, C, minor), 140.8 (br, C), 140.0 (C), 138.3 (C), 134.7 (br, C, major), 134.5 (br, C, minor), 131.1 (br, CH), 129.9 (br, CH), $129.3(\mathrm{CH}), 128.7(\mathrm{CH}), 128.3(\mathrm{CH}), 128.1(\mathrm{CH}), 127.9$ $(\mathrm{CH}), 127.7(\mathrm{CH}), 127.1(\mathrm{CH}), 125.5(\mathrm{CH}), 125.4(\mathrm{CH}), 80.3(\mathrm{C})$, 64.5 (br, CH , major), 62.9 (br, CH , minor), 48.0 (br, $\mathrm{CH}_{2}$, minor), 47.0 (br, $\mathrm{CH}_{2}$, major), $28.5\left(\mathrm{CH}_{3}\right) ; m / z\left(\mathrm{ES}^{+}\right) 394\left(M \mathrm{Na}^{+}, 100 \%\right)$; $R_{\mathrm{f}} 0.27$ (hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 2$ ).

## 6,7-Dihydro-5-phenyl-5H-dibenz[c,e]azepine 22

To a solution of ( $\pm$ )-21 ( $371.5 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in THF ( 3 mL ) was added $85 \%$ aq. phosphoric $\operatorname{acid}^{17}(2.0 \mathrm{~mL}, 29 \mathrm{mmol})$ at room temperature. The mixture was vigorously stirred at room temperature for 72 h , then diluted with water $(10 \mathrm{~mL})$, cooled to $0^{\circ} \mathrm{C}$ and basified to pH 11 by the dropwise addition of 10 M aq. $\mathrm{KOH}(\geq 9 \mathrm{~mL}$ ). After warming to room temperature, the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 10 \mathrm{~mL})$. The combined organic extract was washed with brine ( 20 mL ), dried and concentrated under reduced pressure to give the title compound ( $\pm$ )-22 ( $261 \mathrm{mg}, 96 \%$ ) as a cream solid which formed white needles, m.p. $117-118{ }^{\circ} \mathrm{C}(\mathrm{EtOH})$ (Found: C, 88.47; H, 6.39; N, 5.13. $\mathrm{C}_{20} \mathrm{H}_{17} \mathrm{~N}$ requires C, 88.52; $\mathrm{H}, 6.31 ; \mathrm{N}, 5.16 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ (film) $3313 \mathrm{w}, 3055$, 1492, 1476, 1442, 1291, 1265, 1216, 1190, 1103, 1071, $1029,1006,926,877,846,749,711,697,633 ; \delta_{\text {н }}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 7.59 ( $1 \mathrm{H}, \mathrm{dd}, J 1.5,7.5 \mathrm{~Hz}, \mathrm{ArH}), 7.53-7.28$ ( $10 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ), 7.25 $(1 \mathrm{H}, \mathrm{dt}, J 1.5,7.5 \mathrm{~Hz}, \mathrm{ArH}), 6.83-6.80(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.87(1 \mathrm{H}$, s, $5-\mathrm{H}), 3.89(1 \mathrm{H}, \mathrm{d}, J 13.6,7-\mathrm{H}), 3.66(1 \mathrm{H}, \mathrm{d}, J 13.6,7-\mathrm{H}), 2.43(1$ $\mathrm{H}, \mathrm{brs}, \mathrm{NH}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 141.9(\mathrm{C}), 141.1(\mathrm{C}), 141.0(\mathrm{C})$, 139.5 (C), 137.4 (C), $128.6(\mathrm{CH}), 128.4(\mathrm{CH}), 128.30(\mathrm{CH}), 128.28$ $(\mathrm{CH}), 128.1(\mathrm{CH}), 128.01(\mathrm{CH}), 127.96(\mathrm{CH}), 127.85(\mathrm{CH}), 127.82$ $(\mathrm{CH}), 127.6(\mathrm{CH}), 127.4(\mathrm{CH}), 60.2(\mathrm{CH}), 49.7\left(\mathrm{CH}_{2}\right) ; \mathrm{m} / \mathrm{z}\left(\mathrm{ES}^{+}\right)$ $272\left(\mathrm{MH}^{+}, 100 \%\right) ; R_{\mathrm{f}} 0.01$ (hexane-EtOAc, 3:1), 0.73 (EtOAc$\left.\mathrm{MeOH} / \mathrm{Et}_{3} \mathrm{~N}, 80: 20: 1\right)$.

## Crystal data and structure refinement

$\boldsymbol{t}$-Butyl 5-phenyl-5H-dibenz[ $\mathbf{c}, \boldsymbol{e}]$ azepine- $6(7 \mathrm{H})$-carboxylate 21. CCDC deposition number 793197; Empirical formula $\mathrm{C}_{25} \mathrm{H}_{25} \mathrm{NO}_{2}$; Formula weight 371.46; Temperature 100(2) K; Radiation wavelength $0.71073 \AA$; Crystal system monoclinic, space group $P 2_{1} / c$; Unit cell dimensions $a=9.4053(3) \AA$; $\alpha=90^{\circ} ; b=9.7021(4) \AA$; $\beta=92.978(2)^{\circ} ; \mathrm{c}=21.9587(10) \mathrm{A}^{\circ} ; \gamma=90^{\circ}$; Cell volume 2001.05(14) $\AA^{3} ;$ Z 4; Calculated density $1.233 \mathrm{Mg} \mathrm{m}^{-3}$; Absorption coefficient $0.077 \mathrm{~mm}^{-1} ; F(000) 792$; Crystal size $0.10 \times 0.15 \times$ $0.25 \mathrm{~mm}^{3}$; Data collection method Enraf Nonius FR 590 CCD diffractometer; Theta range for data collection 3.02 to $25.50^{\circ}$; Index ranges $0 \leqslant \mathrm{~h} \leqslant 11,0 \leqslant \mathrm{k} \leqslant 11,-26 \leqslant 1 \leqslant 26$; Reflections collected 14457; Independent reflections $3710[\mathrm{R}($ int $)=0.096]$; Completeness to theta $=25.50^{\circ} 99.7 \%$; Refinement method Full-matrix least-squares on $\mathrm{F}^{2}$; Data/restraints/parameters 3710/0/354; Goodness-of-fit on $\mathrm{F}^{2}$ 1.056; Final $R$ indices [ $I>$ $2 \sigma(I)] R_{1}=0.0861, \mathrm{w} R_{2}=0.1660 ; R$ indices (all data) $R_{1}=0.1888$,
$\mathrm{w} R_{2}=0.2154$; Extinction coefficient $0.0046(12)$; Largest diff. peak and hole 0.411 and -0.405 e. $\AA^{-3}$.

## Molecular mechanics calculations (Fig. 3)

Minimised steric energy (MSE) structures for the $5 S$ stereoisomers of compounds 4, 14, 21 and $\mathbf{2 2}$ were calculated on a Mac Mini 2.6 GHz Intel Core 2 Duo running Linux (Fedora Core 12, x86 64-bit), using MacroModel v. 8.0 (Maestro v. 9.0.211 interface) with the MM3 force field and Monte Carlo conformational search (csearch) method (1000 iterations). The csearch parameters were: no solvent; PRCG method; convergence on gradient; max. number of iterations 3000 ; convergence threshold 0.0200 . For structure graphics see ESI. $\dagger$
