Population projections for Derbyshire County Council

Cathie Marsh Centre for Census and Survey Research, University of Manchester
Ludi Simpson, 14th January 2005.

This document is 'Derbs pop report 14Jan2005.doc'.

To fulfil the first part of CCSR's commission for demographic projections for Derbyshire CC, its Districts and Derby UA, this document provides a report of population projections, summarising the main features of the projections and the differences between alternative projections.

Accompanying this document are:

- Excel files of all the input assumptions and output results, in POPGROUP software format. The inputs and outputs of the several projections that have been supplied are summarised in the file 'Summ_ComparisonDerbsJan09.xls'.
- A technical report detailing the methods used and how to install the projections for Derbyshire County Council to replicate and extend the work in-house, using their copy of POPGROUP software ('Derbs pop technical 14Jan2005.doc').

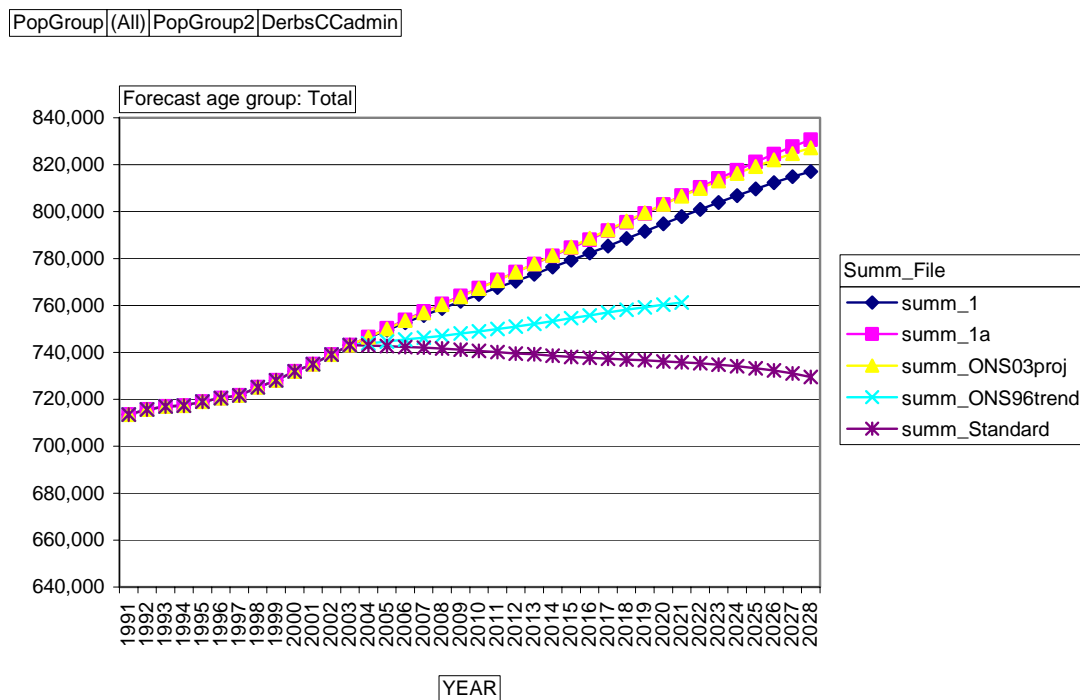

The remaining work will involve projections of population for electoral wards, and of the labour force and of households for Districts (the latter dependent on release by the Office of the Deputy Prime Minister of data consistent with their own 2003-based headship rate projections).

Projections prepared by CCSR

Five projections have been prepared. Each follows the population estimates prepared by the Office for National Statistics from 1991 to 2003. They differ in their subsequent development, as follows:

<i>Standard</i>	National fertility and mortality rates, with zero impact of migration.
<i>ONS96trend</i>	Births, deaths, and migration as projected by Government in their 1996-based projection for Derbyshire County, released in 1998.
<i>ONS03proj</i>	Births, deaths and migration as projected by Government in their 2003-based projection for Derbyshire County, released in 2004.
<i>1</i>	Fertility, mortality and migration rates computed by CCSR based on the average of the last five year's experience.
<i>1a</i>	Fertility, mortality and migration rates computed by CCSR based on the last five year's experience, with migration weighted towards the most recent experience which has been a higher net in-migration.

The chart below shows the total population projected by each of the five sets of assumptions (in this case excluding Derby UA). In the future, Derbyshire County Council will collect further data to develop their preferred population projection. Our recommendation is to develop forecast *1a*, through an understanding of the likely future trends of migration both with the rest of the UK and with overseas.

Exploring the results for service implications

Each projection is made for single years of age. The output files and reporting facilities of POPGROUP allow Derbyshire County Council to examine the service implications of each projection. The output files and their functions are as follows:

- fore* Detailed projected population by sex and single year of age, each year since 1991.
- summ* Summary of population, births, deaths, UK and overseas migration, each year since 1991, suitable for printing on a single page.
- comp* Detail of population, births, deaths, UK and overseas migration, each year since 1991.
- fore-reports* Reporting facility allowing tabular display of results for specified age groups, time series charts, and population pyramids.

All output is on Excel sheets and can therefore be further manipulated and displayed by Derbyshire County Council, and copied to other software for reporting purposes.

Note that each District including Derby UA is included on all files, and the total is the Derbyshire geographic county. Tabular statistics for the Derbyshire County Council administrative area excluding Derby UA can be created with the Reporter, and by manipulating Excel in the Fore, Summ, and Comp files. The comparison of forecasts in 'Summ_ComparisonDerbsJan09.xls' contains values for the County Council Area.

Notes on each forecast

In addition to these notes, the 'Notes' sheet on each POPGROUP input workbook describes the source of each assumption made. The technical report reproduces this documentation.

Standard National fertility and mortality rates, with zero impact of migration.

National fertility and mortality rates are used, with no migration from mid-2003. Prior to mid-2003, the population is constrained to the ONS mid-year estimates.

Migration has a very significant impact on each of Derbyshire's District populations. Because Derbyshire's experience is quite different from the national, the standard forecast is only useful to highlight that local information is needed to monitor and project the local population.

ONS96trend Births, deaths, and migration as projected by Government in their 1996-based projection for Derbyshire, released in 1998.

Prior to mid-2003, the population is constrained to the ONS mid-year estimates. The data supplied by ONS have inconsistencies, in that their components of change each year do not match the total population change projected for the year. For that reason the trend in this projection is only an indication of the 1996-based population trend. This forecast is provided for background context and is not recommended for use.

ONS03proj Births, deaths and migration as projected by Government in their 2003-based projection for Derbyshire, released in 2004.

Prior to mid-2003, the population is constrained to the ONS mid-year estimates. This projection provides a comparison for the subsequent projections and those that can be developed in-house by Derbyshire County Council.

The replication of the ONS 2003-based projections is based on the births, deaths and migration flows provided by ONS. There is a slight discrepancy between those components each year and the resulting ONS population projections, amounting to 400 by the end of the projection in 2028. ONS suggest that this is due to rounding of individual components of change before release.

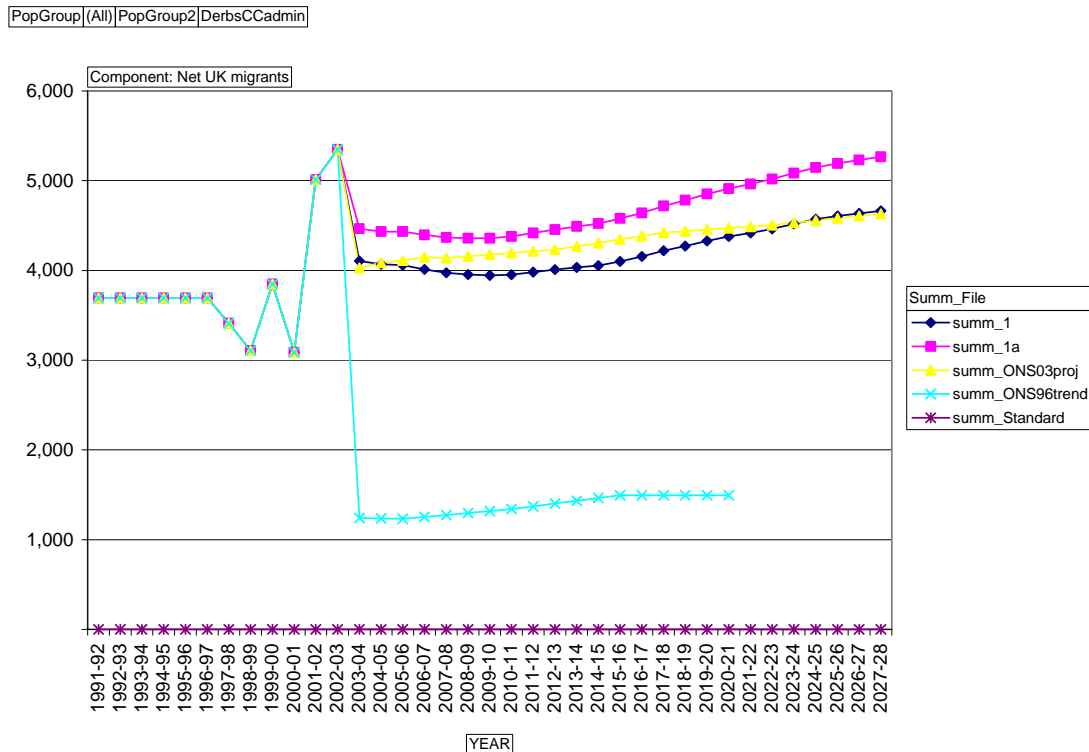

1 and 1a Fertility, mortality and migration rates computed by CCSR based on the average of the last five year's experience.

Forecasts *1* and *1a* are recommended for use and development by Derbyshire County Council. They differ only in their treatment of migration within the UK after 2003, for which Forecast *1a* gives more weight to recent experience of lower gain from migration within the UK.

- For years from 1991 up to the most recent ONS population estimates, mid-2003:
 - Consistency with the ONS estimate at each single year of age and sex.
 - Recorded values for births, deaths.
 - Recorded values of migrants within the UK from mid-1997.

- Estimated values of migrants within the UK before mid-1997, taken as the average of the years 1997-98 to 2001-02.
- Estimated values of overseas migration 1991-2003, based on the residual population change between ONS population estimates after births, deaths and UK migration. Note that the migration estimates are only accurate when taken together, ie in their net impact, which is determined by the ONS mid-year estimates.
- For the projection beyond the most recent ONS population estimate:
 - Fertility and mortality which follow the Government expected trends (by age and sex), but incorporate a local differential, based on the last five year's Total Fertility Rate and Standardised Mortality Ratios for each District, compared to England.
 - Migration with overseas implied by constant age-sex counts based on recent experience (1998-99 to 2002-03).
 - Migration within the UK implied by constant age-sex rates, based on the past five years (1998-99 to mid-2003).
 - Forecast *I*: five years equally weighted
 - Forecast *Ia*: weights as follows:
 - 1998-99 0.1
 - 1999-00 0.1
 - 2000-01 0.2
 - 2001-02 0.3
 - 2002-03 0.3

The chart below shows the UK net migration for the Derbyshire CC area estimated and projected by the forecasts, showing the change in the past five years and the difference in projected migration.

Further charts provided in file 'Summ_ComparisonDerbsJan09.xls' compare the projections for a variety of demographic indicators.

The tables overleaf summarise the forecasts ONS03PROJ and 1a, and are taken from the output 'summ' file of each forecast.

Note on comparisons between ONS03PROJ and 1a

The Council may wish to explore some of the differences between the projections, in order to come to its own favoured assumptions. The methods used by ONS have not been released in detail, and thus reasons for differences are not always available.

Fertility is higher in the ONS projections, for each District, than past figures would indicate. Projection 1a uses the mean of the past five years' experience.

The number of very elderly is lower in the ONS projections. This may be due to slightly different age structures of mortality or of migration. Projection 1a uses one District differential for mortality applied to all ages and both sexes.

Projection 1a suggests a more divergent experience for the Districts than does ONS. South Derbyshire, the fastest growing District in both projections, is expected to grow from 85 thousand to 122 thousand in projection 1a and to 111 thousand by ONS. North East Derbyshire, showing the least growth in both projections, is expected to fall slightly in total population by the end of projection 1a.

Neither of the projections takes explicit account of the impact of planned house-building. Both contain an implicit assumption that the past impact of housing developments will continue in the future. When ODPM provide updated projections of household headship rates, the implications of planned land release and house-building can be explored with the POPGROUP and HOUSEGROUP software.

Scenario *Ia*

'Retired' refers to age 60 for females and age 65 for males

All population figures have been rounded independently to the nearest 50. 0 signifies less than 25

TFR: Total fertility rate, the average completed family size

SMR: Standardised Mortality Ratio (100 = Standard, ASMR: The values are for 2003-2004 taken from the 2002-based GAD projections.)

This report was compiled from a forecast produced on 09/01/2005 using POPGROUP software developed by Bradford Council, the University of Manchester and Andelin Associates

'Retired' refers to age 60 for females and age 65 for males

All population figures have been rounded independently to the nearest 50. 0 signifies less than 25

TFR: Total fertility rate, the average completed family size

SMR: Standardised Mortality Ratio (100 = Standard, ASMR: The values are for 2003-2004 taken from the 2002-based GAD projections.)

This report was compiled from a forecast produced on 03/01/2005 using POPGROUP software developed by Bradford Council, the University of Manchester and Andelin Associates
