THE AUTHORS

Harry C. Minor is an Associate Professor of Agronomy and State Extension Specialist, Carl G. Morris and Howard L. Mason are Senior Research Specialists, and Delbert R. Knerr, David B. Thomas and C. Stephen Lankheit are Research Specialists.

ACKNOWLEDGEMENTS

The authors recognize and express their appreciation to the following individuals for their part in making the 1994 grain sorghum performance trials possible: E.L. Reed and Gerald Stevens, Chillicothe; Kenny Tevis, Hughesville; Richard Primus, Martinsburg; Kurt Gretzinger, Urich; Wally Norton, Lamar; Glenn Nothdurft, Oran; and Tony Jones, New Madrid.

MISSOURI CROP PERFORMANCE

1994

GRAIN SORGHUM

This report is a contribution of the Department of Agronomy, Plant Science Unit, University of Missouri Agricultural Experiment Station. The work received significant support through fees paid by the companies submitting hybrids for evaluation.

The University of Missouri began its performance testing program for grain sorghum hybrids in 1958. The number of commercial entries in the program increased from 40 in 1958 to 134 in 1982. There were 82 hybrids in the program in 1994.

The large number of commercial hybrids available makes selection of a superior hybrid difficult. To select intelligently, producers need a reliable, unbiased, up-to-date source of information that will permit valid comparisons among available hybrids. The objective of the University of Missouri's performance testing program is to provide this information. The tests are conducted under as uniform conditions as possible. Small plots are used to reduce the chance of soil and climatic variations occurring from one plot to another. Results obtained should aid the individual grower in judging the relative merits of many of the commercial grain sorghum hybrids available in Missouri today.

COMPARING HYBRIDS

The performance of a hybrid cannot be measured with absolute precision. Uncontrollable variability is involved in the determination of each yield average. This variability sometimes occurs because the soil is not uniform, but many other conditions may contribute to it. Because variability exists in all field experimentation, statistics are used as a tool to assist in making decisions. The statistical tool used in these trials is the test of least significant difference (L.S.D.). The L.S.D. is quite simple to apply. When two entries are compared and the difference between them is greater than the L.S.D., the entries are judged to be significantly different. Differences smaller than the L.S.D. may have occurred by chance and are judged to be not significant.

Hybrid performance may seem inconsistent from location to location and from year to year because of differences in rainfall, temperature, soil fertility, diseases, insects, and other factors. To obtain an improved estimate of relative hybrid performance, results from more than one location or year should be considered. In this publication, the authors have tried to facilitate comparisons across years and locations.

In each trial, the "top yielding" hybrids have been identified. These hybrids are those that did not yield significantly less than the highest yielding hybrid in the test. They are denoted in the tables by an asterisk (*) next to their yields. Thus, by going down a column, readers can readily identify the highest yielding hybrids in a trial. By going across, readers can evaluate the relative performance of a hybrid during several years or at several locations. From the standpoint of yield, the most desirable hybrids will be those that are among the "top yielding" hybrids (that is, those that have an asterisk) the greatest number of times.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a grain sorghum hybrid. Moisture content at harvest, stalk strength and resistance to insects and diseases are among the hybrid characteristics that deserve careful consideration. High moisture content at harvest, whether due to later maturity or slow dry-down, may indicate an increased drying requirement. Poor stalk strength or susceptibility to pests may decrease harvestable yield because of lodging or stand loss. Therefore, when selecting a hybrid, producers should also consider the data presented on agronomic characteristics other than yield.

The Missouri Agricultural Experiment Station does not recommend specific hybrids. Farmers growing a new hybrid for the first time should consider the information contained in this report and then grow a small acreage to determine adaptability. This should be the practice for all new hybrids regardless of origin.

EXPERIMENTAL PROCEDURES

Entries. All producers of hybrid seed were eligible to enter hybrids in the 1994 evaluation trials. Participation was voluntary. The testing coordinator exercised no control over which hybrid or how many hybrids were entered. However, to help finance the evaluation program, a fee of \$90 per location was charged for each hybrid entered by the seed producer.

Locations. On the basis of geographical characteristics, the state is divided into regions. Grain sorghum hybrid evaluation trials are located in the north-central, southwestern and southeastern regions of the state. In 1994, the locations for these trials were on (1) the E.L. Reed farm near Chillicothe in Livingston County, (2) the Richard Primus farm near Martinsburg in Audrain County, (3) the Kenny Tevis farm near Hughesville in Pettis County, (4) the Kurt Gretzinger farm near Urich in Clinton County, (5) the Wally Norton farm near Lamar in Barton County, (6) the Glenn Nothdurft farm near Oran in Scott County and (7) the Tony Jones farm near New Madrid in New Madrid County. Trial locations are shown on the adjacent map.

Field Plot Design. Each test was arranged in a lattice field plot design with three replications. All plots were four rows wide and 20 feet long. The between-row spacing was 30 inches at all locations. Only the center two rows were harvested to determine yield.

Plot Management. The tests were planted and harvested with equipment designed for small-plot work. Fertilizer was applied at each site at the discretion of the farmer. Herbicides and cultivation were used for weed control and plots were hand weeded as necessary. Management details varied from location to location and are specified on individual yield tables.

Data Recorded. Agronomic characteristics were evaluated at harvest. Head compactness was scored on a scale of 1 to 5. A score of 1 indicates the most compact or tight head, while 5 indicates the most lax or loose head. Lodging was determined by counting the number of culms inclined more than 30 degrees from vertical. This value was converted to a percentage of the total number of culms in each plot. Yield was measured in number of bushels per acre at a moisture content of 14.0 percent. An electronic moisture tester was used for all moisture readings. To convert yield to pounds/acre, multiply bushels/acre by 56.

Electronic Accessibility of Data. Results of the Missouri Crop Performance Trials are now available in two forms: this printed Special Report and Missouri's Agricultural Electronic Bulletin Board (AgEBB). Variety test information is accessible from the MAIN MENU of the AgEBB under "CROP PERFORMANCE TESTING". The system number is 314/882-8289. If you need assistance in accessing the system call 314/882-4827 for the system staff's help.

SUMMARY OF RESULTS

Results for each location include data on plant height, head compactness, percent off-type heads, lodging, grain moisture at harvest, and yield adjusted to 14.0 percent moisture.

Significant yield variation was observed among hybrids at each location. Individual hybrid performance across the three north-central, two southwestern and two southeastern locations are summarized in Tables 5, 8, and 11. Average yields and yield ranges for each trial are summarized in Table 1. The spring weather of 1994 was cool and wet causing some emergence problems. Summer rainfall was below normal for the state, while temperatures remained normal. Because environmental conditions influence the performance of hybrid sorghums, the reader is encouraged to give more weight to results from several locations or years than to those from a single test.

TABLE 1. 1994 YIELD SUMMARY

LOCATION	NUMBER OF ENTRIES	IRRI-GATED	YIELD RANGE	(BU/ACRE) AVERAGE	DATA TABLE
Chillicothe	42	No	110-148	130	2
Hughesville	42	No	134-159	146	3
Martinsburg	42	No	86-123	103	4
Urich	48	No	107-142	124	6
Lamar	48	No	103-136	118	7
Oran	55	Yes	134-165	151	9
New Madrid	55	No	103-160	138	10

An indication of hybrid maturity is moisture content of the grain at harvest. Because high moisture at harvest is generally a disadvantage, growers should give preference to hybrids within a yield group with the lowest moisture content.

TABLE 2. Performance of Grain Sorghum Hybrids evaluated near Chillicothe (Livingston County) on the E.L. Reed Farm (Gerald Stevens, operator) during 1994 and near Spickard (Grundy County) on the North Missouri Center during 1992-93.

Planted: 16 May 1994
 Harvested: 21 September 1994

TABLE 6. Performance of Grain Sorghum Hybrids evaluated near Urich (Henry County) on the Kurt Gretzinger Farm during 1994 and near Nevada (Vernon County) on the Gilbert Wilson Farm during 1992-93.

Planted: 18 May 1994
 Harvested: 27 October 1994
 Planted Population: 104,500 seeds/A.
 Row Spacing: 30 inches
 Soil Type: Hartwell Silt Loam
 Soil Test: pH=6.6, OM=2.3%, P=21, K=180

Fertilizer: N=165; P₂O₅=120; K₂O=80 lbs./A
 Herbicide: Ramrod + Atrazine
 Insecticide: None
 Irrigation: 0.00 inches
 Previous Crop: Grain Sorghum

Growing Season Rainfall: May=1.9, June=2.5, July=2.5, Aug.=6.3, Sept.=2.5, TOTAL=15.7"

NS Not significant at the .05 level.

TABLE 8. Performance of Grain Sorghum Hybrids evaluated at two Southwest Missouri locations (Urich and Lamar) during 1994.

Urich
 Planted: 18 May 1994
 Harvested: 27 October 1994
 Planted Pop.: 104,500 seeds/A.
 Row Spacing: 30 inches
 Soil Type: Hartwell Silt Loam

Lamar
 Planted: 18 May 1994
 Harvested: 29 September 1994
 Planted Pop.: 104,500 seeds/A.
 Row Spacing: 30 inches
 Soil Type: Parsons Silt Loam

Growing Season Moisture: 15.7"

Growing Season Moisture: 28.1"

 Row Spacing: 30 inches
 Soil Type: Dubbs Silt Loam
 Soil Test: pH=6.5, OM=1.6%, P=29, K=147

Fertilizer: N=110; P₂O₅=30; K₂O=30 lbs./A
 Herbicide: Ramrod + Atrazine
 Insecticide: None
 Irrigation: 0.00 inches
 Previous Crop: Soybean

Growing Season Rainfall: May=1.8, June=9.7, July=2.3, Aug.=2.2, Sept.=3.2, TOTAL=19.2"
