Missouri 2004 Soybean Performance Tests

This report is a contribution of the Department of Agronomy, University of Missouri Agricultural Experiment Station. The work was supported by fees from companies and organizations submitting varieties for evaluation. Soybeans were first included in the University of Missouri's variety testing program in 1973. The number of entries in the program has increased from 51 in 1973 to 376 in 2004. The large number of varieties available makes selection of a superior variety difficult. To select intelligently, producers need a reliable, unbiased, up-to-date source of information that will permit valid comparisons among available varieties. The objective of the University of Missouri's performance testing program is to provide this information. The tests are conducted under as uniform conditions as possible. Small plots are used to reduce the chance of soil and climatic variations occurring between the variety plots. Results obtained should aid the individual grower in judging the relative merits of the commercial soybean varieties available in Missouri today.

Comparing Varieties

The performance of a variety cannot be measured with absolute precision. Uncontrollable variability is involved in the determination of each yield average. This variability sometimes occurs because the soil is not uniform, but many other conditions may also contribute. Because variability exists in all field experimentation, statistics are used as a tool to assist in making decisions. The statistical tool used in these tests is the test of least significant difference (LSD). The LSD is quite simple to apply. When two entries are compared and the difference between them is greater than the LSD, the entries are judged to be significantly different. Differences smaller than the LSD may have occurred by chance and are judged to be not significant.

Variety performance may seem inconsistent across locations and from year to year because of differences in rainfall, temperature, soil fertility, diseases, insects, and other factors. To obtain an improved estimate of relative variety performance, readers should consider results from more than one location or year. In this publication, the authors have tried to facilitate comparisons across years and locations.

In each test, the "top yielding" varieties in each maturity group have been identified. These varieties are those that did not yield significantly less than the highest yielding variety in the same maturity group. They are denoted in the tables by an asterisk (*) next to their yields. Thus, by going down a column, readers can readily identify the highest yielding varieties. By going across the page, readers can evaluate the relative performance of a variety during several years or at several locations. From the standpoint of yield, the most desirable varieties will be those which rank among the "top yielding" varieties (that is, have an asterisk) the greatest number of times.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a soybean variety. Standability, maturity, herbicide tolerance and disease resistance are among the characteristics that deserve careful consideration. Several diseases prevalent in Missouri can be devastating to susceptible varieties. Lodging may reduce yields and slow harvest. Poor seed quality is often associated with varieties which mature while temperatures are still high. Late maturing varieties are occasionally killed by frost. Selection of varieties from several maturity groups can be helpful in spreading out harvest dates. Therefore, information presented on disease reaction, lodging, herbicide tolerance, and maturity should also be considered when selecting a variety.

The Missouri Agricultural Experiment Station does not recommend specific varieties. Farmers growing a new variety for the first time should consider all available information and then grow a small acreage to determine adaptability. This should be the practice for all new varieties regardless of origin.

The Authors

William J. Wiebold is an Associate Professor of Agronomy and State Extension Specialist; Howard L. Mason is a Senior Research Specialist; Delbert Knerr, Richard W. Hasty, Eddie G. Adams, David M. Schwab, and Scotty L. Smothers are Research Specialists; Travis Belt is a Research Associate in Agronomy; and Bruce Burdick is the Superintendent of the Hundley-Whaley Research Center.

The authors recognize and express their appreciation to the following individuals for their part in making the 2004 soybean tests possible: Steve Cunningham, Craig; Bruce Burdick, Superintendent, Hundley-Whaley Research Center, Albany; Ron and Bud Beetsma, Mooresville; Bill Cason, Macon; Roger Tiemann, LaGrange; John Williams, Henrietta; Ryland Utlaut, Grand Pass; Tim Reinbott, Superintendent, Bradford Research and Extension Center, Columbia; Roy Cope, Truxton; Bob Burkemper, Annada; Doug Roth, Harrisonville; Darrel Tenholder, Adrian; Kurt Gretzinger, Urich; Steve Cubbage, Nevada; Wally Norton, Lamar; Glenn Nothdurft, Oran; John Pounder, East Prairie; Tom Jennings, Morehouse; and Jake Fisher, Superintendent, Delta Research Center, Portageville.

Experimental Procedures for Soybean Tests

Test Descriptions:

Glyphosate Resistant Soybean Test: This test includes glyphosate resistant varieties and receives a post emergence application of glyphosate.

Non-Glyphosate / Special Traits Soybean Test: This test is a combination of the non-glyphosate soybean test and the special traits soybean test. Examples of soybean lines with special traits include: tofu, natto, food grade, isoflavone, high oil, fatty acid profile, and high protein. Three high yield check varieties were included in these tests for comparison.

Entries: All producers of soybean varieties were eligible to enter the 2004 soybean evaluation tests. Participation was voluntary and the test coordinators exercised no control over which, or how many varieties were entered. To help finance the evaluation program, the participants paid \$100 per location for each variety entered.

Plot Management: All tests were planted and harvested with commercial equipment modified for small plot work. Row spacing for soybean tests in the North, Central and Southwest Regions was 15 inches. Row spacing for soybean tests in the Southeast Region was 30 inches. Seeding rate for the 15 inch row spacing was 151,300 seeds and 174,200 seeds/Acre for the 30 inch row spacing. Fertilizer was applied at each location at the discretion of the farmer or the station manager. Weed control was achieved with Roundup herbicide for the Glyphosate Resistant tests and various other herbicides for the Non-Glyphosate/Special Traits tests and additional hand weeding was done as required. Management details varied from location to location and are specified in the regional crop management summaries.

Data Recorded: Maturity group classification is provided by the entry sponsor. Maturity data is recorded when approximately 75 percent of the pods have turned color. Lodging and height are determined immediately before harvest. A scale of 1 to 5 is used to score lodging. Interpretation of the scale is as follows: 1 = all plants erect, 3 = all plants leaning moderately or 20 to 50% down, 5 = all plants down.

Data on maturity, plant height, lodging and yield are given for each entry and location. Yield is measured in bushels (60 pounds) per acre at a moisture content of 13.0 percent. An electronic moisture tester is used for all moisture readings.

All soybean locations were tested for the presence of SCN eggs in the soil prior to planting. Every effort was made to locate the test sites in fields of low to moderate levels of SCN. These numbers are given in the heading information of each table.

Accessibility of Data: The results of the 2004 Crop performance tests are also available online at

<http://agebb.missouri.edu/cropperf/vartest>. If you need assistance in accessing the system; call 573-882-4827 for help.

Field Plot Design. Statistical designs used to analyze the field data included randomized lattice with 3 replications and randomized complete block with 4 replications, depending on the size of the test. Individual plots were four rows wide. When row spacing was 15 inch, row length was 25 feet. Row length was 20 feet when row spacing was 30 inches. All four rows of each plot were harvested for the 15 inch row spacing test and only the center two rows of each plot were harvested for the 30 inch row spacing to determine yield.

Locations: On the basis of geographical characteristics, the state was divided into regions. Glyphosate Resistant and Non-Glyphosate Resistant/Special Traits soybean varieties were evaluated at twenty locations in all regions of the state. Test locations are shown on the adjacent map.

North Missouri

1. Steve Cunningham farm, Craig (Holt Co.)
2. Hundley-Whaley Research Center, Albany (Gentry Co.)
3. Beetsma farm, Mooresville (Livingston Co.)
4. Bill Cason farm, Macon (Macon Co.)
5. Roger Tiemann farm, LaGrange (Lewis Co.)

Central Missouri

6. John Williams farm, Henrietta (Ray Co.)
7. Ryland Utlauf farm, Grand Pass (Saline Co.)
8. Bradford Research & Ext. Ctr. Columbia (Boone Co.)
9. Roy Cope farm, Truxton (Montgomery Co.)
10. Bob Burkemper farm, Annada (Pike Co.)

Southwest Missouri

11. Roth farm, Harrisonville (Cass Co.)
12. Darrel Tenholder farm, Adrian (Bates Co.)
13. Kurt Gretzinger farm, Urich (Henry Co.)
14. Steve Cubbage farm, Nevada (Vernon Co.)
15. Wally Norton farm, Lamar (Barton Co.)

Southeast Missouri

16. Glenn Nothdruft farm, Oran (Scott Co.)
17. John Pounder farm, East Prairie (Mississippi Co..)
18. Tom Jennings farm, Morehouse (Stoddard Co.)
19. Delta Research Center-Loam, Portageville (Pemiscot Co.)
20. Delta Research Center-Clay, Portageville (Pemiscot Co.)

North Region Crop Management Summary

There are five locations in the northern region of Missouri for glyphosate resistant and non-glyphosate resistant / special trait soybean tests. They are located in counties where a significant number of acres of soybean are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary from location to location, but tend to reflect those followed by farmers in the area.

Planting dates ranged from May 11 to June 28 with soil conditions being very good at all locations. Planting of the Macon site was delayed until June 28 by excessive rainfall. This, along with heavy rains after planting, resulted in very poor stands. The Macon location was discarded. The Albany non-glyphosate / special trait test sustained substantial damage from herbicide drift from an adjacent field. That test was discarded as well. Yields at the other north locations were normal or above normal although some disease pressure was present.

Climatological information for the growing season for North Missouri (May 1 – September 30) is summarized below.

Average temperature = 68.7 degrees, 1.9 degrees below normal

Average precipitation = 22.2", 1.6" above normal

Central Region Crop Management Summary

There are five locations in the central region of Missouri for glyphosate resistant and non-glyphosate resistant / special trait soybean tests. They are located in counties where a significant number of acres of soybean are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary from location to location, but tend to reflect those followed by farmers in the area.

Planting dates ranged from April 28 to June 3 with soil conditions being very good at all locations. Yields at all five of the central locations were normal or above normal although there was some disease pressure present.

Climatological information for the growing season for Central Missouri (May 1 – September 30) is summarized below.

Average temperature = 70.1 degrees, 1.6 degrees below normal

Average precipitation = 23.4", 3.6" above normal

** Highest yielding variety in the maturity group.

* Yield not significantly less than the highest yielding variety in the maturity group.

Note: To view seed treatments for these varieties refer to the location table or the characteristics chart.

Southwest Region Crop Management Summary

There are five locations in the southwestern region of Missouri for glyphosate resistant and non-glyphosate resistant / special trait soybean tests. They are located in counties where a significant number of acres of soybean are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary from location to location, but tend to reflect those followed by farmers in the area.

Planting dates were May 7 to June 3 with soil conditions being very good at all locations. Growing season rainfall and temperatures were near normal for the season. The tests at Harrisonville and Urich have not been harvested yet due to excessively wet field conditions. If weather permits, these two locations will be harvested later this fall and results from the tests will be available online at our website. Yields at the other three southwest locations were normal or above normal although some disease and insect pressure was present.

Climatological information for the growing season for Southwest Missouri (May 1 – September 30) is summarized below.

Average temperature = 71.0 degrees, 1.5 degrees below normal

Average precipitation = 22.5", 0.5" above normal

Table 18. Southwest Region Crop Management Summary

Location	Planting date	Harvest date	Fertilizer			Tillage	Herbicide	
			N	P ₂ O ₅	K ₂ O		Pre	Post

Southeast Region Crop Management Summary

There are five locations in the southeastern region of Missouri for glyphosate resistant and non-glyphosate resistant / special trait soybean tests. They are located in counties where a significant number of acres of soybean are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary from location to location, but tend to reflect those followed by farmers in the area.

Planting dates were from April 29 to May 29 at the five locations with soil conditions being very good at all locations. Rainfall was somewhat below normal for southeastern Missouri and temperatures were about normal providing adequate growing conditions for the soybean crop. Yields at the East Prairie location were below normal due to dry conditions but yields at the other locations were normal or above normal for the region.

Climatological information for the growing season for Southeast Missouri (May 1 – September 30) is summarized below.

Average temperature = 74.2 degrees, 0.3 degrees below normal

Average precipitation = 17.4", 1.7" below normal

Maturity group III soybean variety entered in the maturity group IV test.
 -- Data not available.

** Highest yielding variety in the maturity group.

* Yield not significantly less than the highest yielding variety in the maturity group.

+ Seed Treatments: 1= Allegiance (Metalaxyl); 2=Apron Maxx (Mefenoxam, Fludioxonil); 3= Apron XL (Mefenoxam); 4= Molybdenum; 5= Protégé (Azoxystrobin); 6= Rival (Captan, Pentachloronitrobenzene, Thiabendazole); 7= Soygard (Metalaxyl, Azoxystrobin); 8= Vitavax (Carboxin)

TABLE 29. **Glyphosate Resistant Soybean Test**
Southeast Region: East Prairie, MO (Mississippi County)

Soil Type: Canalou Loamy Sand
Soil Test: pH=6.3; OM=1.1%; P=90; K=176

Cyst Nematode Population at Planting: 2655 Eggs/250cc Soil
Rainfall: May = 7.9, June = 1.4, July = 4.5, Aug = 2.8, Sept = 0.3 Total=16.9 in.
Irrigation: None

Maturity group III soybean variety entered in the maturity group IV test.

** Highest yielding variety in the maturity group.

* Yield not significantly less than the highest yielding variety in the maturity group.

Note: To view seed treatments for these varieties refer to the location table or the characteristics chart.

TABLE 34. Non-Glyphosate Resistant / Special Traits Soybean Test
Southeast Region: Oran, MO (Scott County)

Soil Type: Commerce Silt Loam
Soil Test: pH=5.5, OM=1.9%, P=55, K=257

Cyst Nematode Population at Planting: 1492 Eggs/250cc of soil
Rainfall: May= 4.7, June= 1.7, July= 4.9, Aug.= 2.1, Sept.= 0.4 Total=13.8 in.
Irrigation: None

NA – Information Not Available

Seed Treatment: 1= Allegiance (Metalaxyl); 2=Apron Maxx (Mefenoxam, Fludioxonil); 3= Apron XL (Mefenoxam);
4= Molybdenum; 5= Protégé (Azoxystrobin); 6= Rival (Captan, Pentachloronitrobenzene, Thiabendazole));
7= Soygard (Metalaxyl, Azoxystrobin); 8= Vitavax (Carboxin)

Variety/ Brand: V for variety, BR for brand

Maturity Group: Relative Maturity Group

Experimental Variety: Y or N

Phytophthora Field Tolerance: Scale 1-9 (1 = excel, 9 = poor)

Phytophthora Gene: (Rps 1a, Rps 1c, Rps 1k, S = None)

Cyst Nematode Source: Peking, PI88788, Hartwig, or S=Susceptible

Herbicide Resistance: GR (glyphosate), STS, or None

Special Traits: High Oil, Food grade, Protein, Tofu, etc.
