ZEP520A Contrast Curves

Abstract

This report documents the contrast curves for the ZEP520A electron beam lithography resist from ZEON Chemicals. Dilution by weight of ZEP520A vs spin speed from 1000 to 6000 rpm was generated in previous work. The aim is to provide an approximate clearing and base dose for the ZEP520A standard process at the Singh Center for Nanotechnology.

Keywords

ZEP520A, contrast curve, o-xylene, room temperature, clearing dose, base dose

Disciplines

Nanoscience and Nanotechnology

Goal:

This report documents the contrast curves for the ZEP520A electron beam lithography resist from ZEON Chemicals. Dilution by weight of ZEP520A vs spin speed from 1000 to 6000 rpm was generated for this work and can be found at http://repository.upenn.edu/scn_protocols/31/. The aim is to provide an approximate clearing and base dose for the ZEP520A standard process at the Singh Center for Nanotechnology.

Materials:

- ZEON Chemicals ZEP520A at various dilutions
- 3" Si wafers
- Two clean beakers large enough to develop a 3" wafer
- O-xylene
- Isopropyl Alcohol (IPA)
- Timer
- TexWipe

Equipment:

- ReynoldsTech Spinner
- Torrey Pines Scientific Hotplate
- Filmetrics F40
- Elionix ELS-7500EX Electron Beam Lithography (EBL) Tool

Protocol:

Spin Coat and Soft Bake

1. Mount wafer and ensure that it is centered on the ReynoldsTech Spinner
2. Spin wafer at a fixed RPM for 60 seconds.
3. Bake wafer at 180 °C for 90 seconds and allow wafer to cool after removal.

Exposure

1. Generate an array of 60 micron by 60 micron square in a dose matrix on a 100 micron pitch.
2. Using the Elionix ELS-7500EX EBL tool, expose the pattern using 100pA with a 30 micron objective lens aperture (OLA, a.k.a. final aperture).

Development at ~20°C

1. Pour o-xylene into the first clean beaker.
2. Pour IPA into the second clean beaker.
3. Set timer to 70 seconds.
4. Drop exposed wafer into bath of o-xylene making sure the wafer is completely submerged, and start the timer. Do not agitate.
5. After 70 seconds submerge the wafer into the IPA bath to stop development.
6. After roughly 30 seconds remove the wafer and place on a TexWipe.
7. Blow dry the wafer with N₂.

Measurement

1. Allow the Filmetrics F40 light to warm up for at least 5 minutes.
2. Click *Baseline...* to calibrate the tool using the SiO₂ and Si standards.
3. Mount wafer and select the *ZEP520A on Si* recipe.
4. Measure the resist thickness at the center of each square.

Results:

Development: 70s O-xylene, 30s IPA Bath Rinse, N₂ Blow Dry

Pads were exposed to 115 $\mu\text{C}/\text{cm}^2$. Data has been truncated for formatting purposes.
