Organized by : Department of Chemical Engineering Faculty of Industrial Technology Institut Teknologi Bandung

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

PREFACE

This BioEnChe-STKSR2013 proceeding contains of the collections of research works presented in International Conference of Bio Energy Chemicals and Materials 2013 (BioEnChe 2013) that was held in Institut Teknologi Bandung. The conference is in conjunction with annual Chemical Engineering Seminar of Soehadi Reksowardjojo (Seminar Teknik Kimia Soehadi Reksowardojo, STKSR 2013).

The international conference provides an opportunity to publicize research works which done or in ongoing ones in many research institution. As the use of fossil base energy and other derivate become harmful for human life, the uses of renewable resource become more interest in our daily life. Therefore, the science and technology for utilization of those resources become enhanced to get more effective and efficient process to produce their products.

We have expectation in this occasion is not only a good place to exchange and discuss the progress of their research in bioenergy, biochemical and biomaterials, but also a venue to collect and to disseminate the most updated technologies and the researches of regional issue and public interest in order to contribute to the community and to draw support from the industrial and the governmental sectors. As this conference has main theme of biorenewable resources utilization for bioenergy, biochemical and material, hopefully this conference will contribute to enhance the utilization of renewable resources for many uses.

We would like to grateful to all participants and sponsors who has contributed to the conference, to the organizing committee for their commitment in their busy days so that the conference is possible to be held and conducted successfully.

Thank you,

moleraro

Dr. Tirto Prakoso, MEng. Conference Chairman

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

BOOK I

BIODIESEL

CODE	TITLE	AUTHORS	
BD.03	The Effect of Pre-Washing Step Using CaO in Biodiesel Dry Washing using Rice Husk Ash Adsorbent	Ade Kurniawan, Indra Perdana, Arief Budiman	51
BD.04	Kinetic Study Of Ultrasound Assisted Transesterification From Waste Cooking Oil	Haris Nu'man Aulia, Widayat, Setia Budi Sasongko	63
BD.05	Synthesis of biodiesel using carbon based-solid catalyst	Febri Raharningrum, Yano Suryapradana, Arif Hidayat, Arief Budiman	77
BD.07	Biodiesel from Low-cost Feedstock and Renewable Resource	Putri Restu Dewati, Dyah Retno Sawitri, Ade Kurniawan, Arief Budiman	85
BD.09	A Kinetics Study of Fatty Acid Esterification over Sulfated Zeolite-Zirconium Catalyst for Biodiesel Production	Ratna Dewi Kusumaningtyas, Masduki, Arif Hidayat, Rochmadi, Suryo Purwono, Arief Budiman	97
BD.13	Kinetics of Palm Oil Transesterificataion Using Double Promoted Catalyst CaO/KI/g- Al2O3 in Refluxed Methanol	Nyoman Puspa Asri, Kusno Budikaryono, Suprapto, Achmad Roesyadi	113
BD.17	Studies of FAME Production and Fractionation from Coconut Oil	J.P. Sitompul, R. Muhtadi, Rinjani, H. Shudri, D. Lestari, Dinarti, R.W. Kurnianto, H.W. Lee, T.H. Soerawidjaja	129
BD.19	Utilization of Palm Oil Mill Effluent for <i>Chlorella vulgaris</i> Cultivation Medium under Mixotrophic Condition as Feedstock of Biofuel	M. M. Azimatun-Nur, and H. Hadiyanto	141
BD.20	Biodiesel Production From Rubber Seeds (Hevea brasiliensis) with In Situ and Acid Catalyst Method by Using Ultrasonic Assisted	Widayat, Agam Duma Kalista Wibowo, M Sigit Samsena, Louis Adi Wiguno	153
BD.21	EN14105 Modification Mothod for Determination of Free Glycerol and Mono-Di-Triglyceride Content in Biodiesel	Joelianingsih, Imansyah Indra, and Is Sulistyati	169

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

CODE	TITLE	AUTHORS	
BD.23	Experiment on Hydroxy (HHO) Gas Addition on Performance and Exhaust Gas Emissions of a Compression Ignition Engine Fuelled with Rubber Seed Methyl Ester	Iman K. Reksowardojo, Ratnak Sok, Tirto Prakoso, Toshio Shudo, Wiranto Arismunandar, Sovanna Pan	181

BIOETHANOL

CODE	TITLE	AUTHORS	
BE.02	Bioethanol Production Comparison of Elephant Grass and Liquid Waste Plant Wheat Boga Sari	Ni Ketut Sari, C. Pujiastuti, I Nyoman Abdi	191
BEP.01	Analysis on Chemical Components of Woods to Predict Ethanol Production Values	Wahyu Dwianto, Fitria, Ika Wahyuni, Danang Sudarwoko Adi, Rumi Kaida, Takahisa Hayashi	209

BIOMASS GASIFICATION

CODE	TITLE	AUTHORS	
BMG.01/ BMGP.01	IMPLEMENTATION OF BIOMASS GASIFICATION TECHNOLOGY IN NATURAL RUBBER PROCESSING SECTOR	Didin Suwardin	217
BMG.04	Design, Simulation and Experiments of Circulating Fluidized Bed Reactor for Biomass Gasification	Dr. Haifa Wahyu, Ir. Imam Djunaedi, Ir. M. Affendi, Ir. Sugiyatno, MT	227
BMG.05	Scaling-up and Implementation of Circulating Fluidized Bed Gasifier for Biomass Gasification in Siak Region	Dr. Haifa Wahyu	243

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

BIOHYDROGEN

CODE	TITLE	AUTHORS	
BH.01	Effect of Agitation Condition on BioHydrogen Production in Stirred Tank Reactor	Tantular Nurtono, Christina Wahyu Kartikowati, Wa Ode Cakranirwana, Widiyastuti, Sugeng Winardi	255
BH.02	Dynamic Separation of Hydrogen from Producer Gas Using Pd-Ag Membrane	Yogi Wibisono Budhi, Rusdi, Irwan Noezar, Allan A.B. Padama, and Hideaki Kasai	265

BIOHYROCARBON

CODE	TITLE	AUTHORS	
BHC.02	Synthesis Bioaviation Turbine Jet Fuel from Ozonolysis of Jathropha curcas Oil Methyl Ester	Irwan Kurnia, and Tirto Prakoso	281
BHC.03	Electrochemical Hydrogenation of Terpene Hydrocarbons	Tedi Hudaya, Antonius Rionardi, Tatang Hernas Soerawidjaja	293

BIOMASS TO LIQUIFACTION

CODE	TITLE	AUTHORS	
BL.02	Preparation of fermentable sugars from coconut coir dust lignocelluloses by pretreatment of ionic liquid 1,3- methylmethylimidazolium dimethyl phosphate	Hanny F. Sangian, Junaidy Kristian, Sukma Rahma, Silvya Yusnica Agnesty, Setyo Gunawan, Arief Widjaja	303
BL.03	Degradation of Chitosan by Ultrasonication and Hydrothermal in The Presence of Acetic Acid as Degradation Agent	S.R.Juliastuti, E.Savitri, F.Kurniawansyah, Sumarno and A. Roesyadi	325
BL.04	Effect of oxalic acid catalyst on hydrolysis of cellulose in NaCl ionic liquid	N.E. Mayangsari and Sumarno	337
BL.05	PRETREATMENT OF SEAWEED WASTE BIOMASS USING IONIC LIQUIDS TO ENHANCE ENZYMATIC SACCHARIFICATION	Uju, Masahiro Goto and Noriho Kamiya	347

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

BOOK II

CODE	TITLE	AUTHORS	
BM.04	Microbial Nanomagnetic Particle Production: Effects of Carbon and Iron Sources	M.T.A.P. Kresnowati, Andy Wiranata Wijaya, and Andry	353
BM.05	Production of Natural Composite with Alkaline Treatment Using Empty Fruit Bunch Ash Extract Solution	Helena Rouhillahi, Zulfansyah, Hari Rionaldo, Warman Fatra	363

Utilization of Palm Oil Mill Effluent for *Chlorella vulgaris* Cultivation Medium under Mixotrophic Condition as Feedstock of Biofuel

M.M. Azimatun-Nur^{1,2} & H.Hadiyanto¹

¹ Center of Biomass and Renewable Energy Diponegoro University Jl.Prof Soedarto S.H. Tembalang, Semarang 50275 Indonesia ²Master Degree of Chemical Engineering Diponegoro University Jl. Prof Soedarto, S.H Tembalang Semarang Email: hady.hadiyanto@gmail.com

Abstract. Indonesia is largest palm oil producer in the world. Increasing of palm oil influence palm oil mill effluent (POME) production. Several researcher reported that POME is a potential medium for microalgae to grow. Microalgae cultivated in mixotrophic condition has received attention as according to higher biomass and lipid productivity to provide biofuel feedstock. The aim of this research is to study growth of *Chlorella vulgaris* cultured in POME medium using different organic carbon source under mixotrophic condition. Carbon source (glucose, glycerol, and acetic acid) was added in 0-1.2gr/l concentration in 40% and 100% POME. Biomass was harvested using autoflocculation method, and dry biomass was extracted using ultrasound method to obtain lipid content. Our result revealed that *C. vulgaris* could grow on mixotrophic condition in POME medium and produce higher biomass and lipid content rather than autotrophic condition. Concentration of organic source also influenced in growth rate and biomass production. This provides a promising process to utilize POME and produce biomass as feedstock of biofuel from microalgae.

Keywords: biofuel feedstock; Chlorella vulgaris; Mixotrophic cultivation; POME.

1 Introduction

Indonesia is the largest producer of coconut palm in the world. In 2008, Indonesia produced 44% coconut palm of shared demand from around the world and from 2005 to 2008 the production rose up to 8.88% [1]. Moreover, the production is still increasing as predicted from 2010 to 2014, it will grow in about 5.22% per annum (Table 1).

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

Table 1 Commodities of Indonesia agriculture 2010-2014 [2]							
Commodities		Growth					
Commountes	2011	2012	2013	/annum			
Coconut Palm	24.429	25.046	27.046	5.22%			
Rubber	2.711	2.741	2.771	1.10%			
Coconut	3.290	3.317	3.348	0.86%			

About 1 ton fresh fruit bunch (FFB) can be converted to 0.66 ton as palm oil mill effluent [3]. Almost of POME in Indonesia is treated by using open anaerobic pond to reduce COD and BOD content.

One of potential source of biofuel is microalgae [4]. Several kind of microalgae can produce high biomass and accumulate high lipid in rapid time, and grow in non-arable land, even in wastewater.

Digested POME contains rich nutrient such as nitrogen and phosphorus that highly potential fertilizer for microalgae growth [5,6,7]. This medium could decrease fertilizer cost for microalgae cultivation, since cost of nitrogen and phosphorus fertilizer have almost doubled every year [8]. However, POME has high turbidity and dark color. This could be potential to inhibit light intensity and form mixotrophic condition.

Several microalgae can grow well in autotrophic condition, while the others grow in heterotrophic condition. Autotrophic condition is occured when microalgae utilize inorganic carbon source and light in photosynthetic reaction. In heterotrophic condition, microalgae utilize organic carbon source as energy source to form biomass, without light energy. However a mixing of these condition is called mixotrophic, when microalgae utilize organic and inorganic carbon source and light as energy to grow in a complex reaction [9,10]. Microalgae cultivated under mixotrophic condition utilize lower energy but accumulate higher biomass productivity [9,10,11].

Heredia-Arroyo et al. [12] cultivated *C. vulgaris* under mixotrophic condition using different glucose, glycerol, acetate, and mixture of those organic carbon, and revealed that lipid productivity was high by adding glucose and glycerol. But it still utilize synthetic fertilizer to grow. The purposes of this research is to investigate growth, biomass and lipid accumulation of *Chlorella vulgaris* in Palm Oil Mill Effluent (POME) under mixotrophic condition.

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

2 Experimental Method

2.1 Cultivation Medium

Medium for cultivation is POME collected from PTPN VII 4th aerobic lagoon before released to environment. POME was filtered by using filter cloth to reduce total suspended solid. Medium was cooled for temperature 28^oC. POME in this research contained COD 1620 ppm and N total 284 ppm.

2.2 Culture Chlorella vulgaris

Chlorella vulgaris was purchased from BBPAP Jepara and cultivated in modified medium [13] consist of 40ppm urea, 20ppm TSP, 10ppm ZA, 1ppm FeCl₃ and 25 μ g/l vitamin B12. Medium was used as control variable in autotrophic condition.

2.3 Cultivation Condition

Chlorella vulgaris was cultivated in different carbon source: D-glucose, crude glycerol, and NaHCO₃ with concentration (0,200,400,600,800,1000,1200 g/l). NaHCO₃ is used as sole inorganic carbon source to compare with other organic carbon source. In experiment, microalgae 10% v/v (0,7 OD₆₈₀) and 40% v/v POME wastewater was mixed and diluted using distilled water in 1L glass flask. Medium was conditioned in 3000 lux intensity, pH 6.8-7.2, 26-28^oC temperature, 2ppt salinity, and aerated using aquarium air pump to mix the medium.

2.4 Measurement

The concentration of biomass was measured using spectrophotometer Optima sp-300 at 680nm wavelength for 6 days. The optical density was plotted in dry biomass to make regression between optical density (y) and dry biomass (gr/l) (x).

Specific growth rate (μ) was calculated using equation from Putri et al. [6] in logaritmic growth phase (Eq 1).

$$\mu = \frac{\ln(OD_1) - \ln(OD_0)}{t - t_0} \tag{1}$$

 OD_1 is optical density at last day of cultivation, OD_0 is optical density at first

day of cultivation, t is end time of cultivation (day), and t_0 is beginning time of cultivation (day).

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

2.5 Harvestment

Medium was harvested using flocculation method. NaOH 0.5 M was used to increase the pH until reach 10.5, then the microalgal suspension was intensively mixed (1000 rpm) for 10 min followed by gentler mixing (250 rpm) for an additional 20 min. Subsequently, the suspension was settled for 30 min [14]. Biomass was dried at 55° C tray dryer for 2 hours and the total biomass product was weighed as (X).

2.6 Lipid Extraction

Lipid extraction was applied using ultrasound extraction method [15]. Dry Biomass was extracted using n-hexane (1:10 gr/ml). Mix of dry biomass and n-hexane was placed in ultrasound assisted Branson 2510-DTH 40 kHz for 30 minutes and temperature 35^{0} C. N-hexane containing lipid was separated using whatman filter paper. Solvent was removed by distillation method until no more solvent collected. Dry residue was then extracted again for three replication. Total Lipid was weighed (W_2). Lipid content was calculated as equation 2.

$$L = \frac{W_2}{W_1} \cdot 100\%$$
 (2)

L is lipid content (%), W_1 is total biomas product in dry basis (mg/l), W_2 is total lipid content (mg/l). Lipid productivity (Y,mg/l/day) was calculated using equation 3.

$$Y = \mu . L . W \tag{3}$$

Where Y is lipid productivity in mg/l/day, μ is specific growth rate of cultivation in d⁻¹, L is lipid content (%), and W is total dry biomass content (gr/l).

3 Result and Discussion

3.1 Biomass vs Optical Density

Relationship between DW (dry weight) and OD (optical density) in this research was described in Figure 1. The result was plotted in linear equation y=1.481x + 0.0071 (R²=0.9983).

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

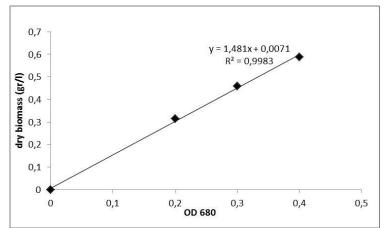

Figure 1 Relationship between OD680 vs dry biomass Chlorella vulgaris

This result was used to simplify measurement of dry biomass in cultivation.

3.2 Growth Rate and Biomass Production

3.2.1 Growth Rate

In D-glucose addition, highest growth rate was recorded from 1000 ppm. In glycerol addition, highest growth rate was recorded from 600 ppm. And by using NaHCO₃, highest growth rate was reached in 200 ppm addition. According to kind of carbon source, higher growth rate was obtained from glucose, followed by glycerol, and NaHCO₃ (Table 1).

				ing annerene	eare on soure	addition	
Courses	Carbon concentration (ppm)						
Source	200	400	600	800	1000	1200	
D-glucose	0.572	0.679	0.935	1.106	1.406	1.356	
Glycerol	0.188	0.251	0.328	0.230	0.181	0.161	
NaHCO ₃	0.317	0.261	0.178	0.146	0.110	0.074	

 Table 2 Growth rate (d-1) in 40% POME using different carbon source addition

Due to different carbon and nitrogen ratio in medium, growth rate of microalgae was changed. Lack of carbon ratio seems to inhibit microalgae to grow. Moreover, 40% POME contains 648 ppm, it provides 243 ppm carbon (taken from 12/32 COD) and gave 2.15 C/N ratio. However optimum microalgae composition approximately 6.22 C/N ratio. It needs more carbon to grow. When more organic carbon source was added, (i.e. glucose 1000 ppm), it seems that medium meet the optimum required C/N ratio, and influenced growth rate.

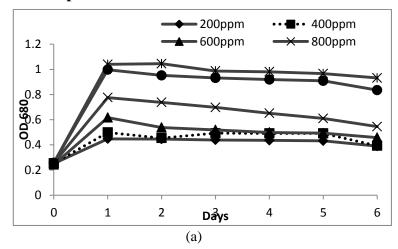

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

However in NaHCO₃ addition, growth rate was lower than other organic source. Microalgae seems not suitable to consume inorganic carbon source in mixotrophic condition. By adding 200 ppm and 400 ppm concentration, growth rate was slightly increased but drop when > 600 ppm was added. It seems that residual organic content in POME (i.e. acetic) was limiting growth of *C.vulgaris* rather than inorganic. When inorganic carbon was added, growth rate became lower due to inhibition factor. In addition, if the condition was changed to autotrophic, control medium, growth rate was recorded up to 0.354/ day, higher than in mixotrophic. This result revealed that inorganic condition is suitable for photosinthetic reaction.

When 1200 ppm of D-glucose was added, growth rate of *C. vulgaris* also decreased. Several researched informed that glucose could inhibit growth of microalgae in high concentration because excess carbon source could become toxic and C/N factor that far from microalgae demand 56/9 ratio [16].

However in glycerol addition, highest growth rate was recorded in 600 ppm. It seems that toxic matter in crude glycerol (i.e. residual methanol, FFA, etc) could inhibit growth of *C. vulgaris*.

3.2.2 Biomass production

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

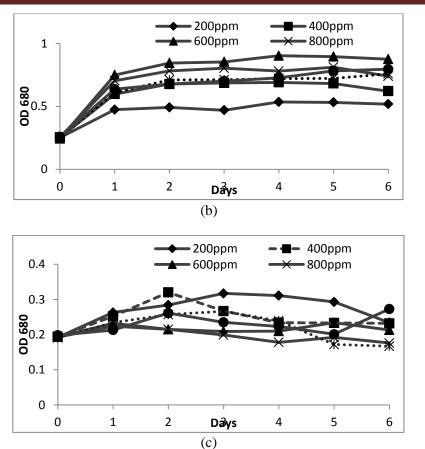

Figure 2 Growth phase of C. vulgaris in 40% POME (a) D-glucose

Microalgae cultivated in D-glucose addition gave high biomass product in day one, and decresase slowly (Figure 2). Highest biomass was produced from 1000 ppm D-glucose addition, in about 1.4 gr/l dry weight, followed by 1200 ppm. While by using glycerol, highest biomass production was recorded from 600 ppm, in about 0,98 gr/l dry weight at 2^{nd} day and drop in 3^{rd} day. This phenomena revealed that D-glucose is easily to be utilized as organic carbon source rather than glycerol in mixotrophic condition [17].

When we use NaHCO₃ as source of carbon in mixotrophic condition, the biomass production is lower in average 0.39 gr/l due to limitation as mentioned in section 3.2.1. However when we use NaHCO₃ in autotrophic condition, biomass production reach 0.7 gr/l dry weight in 5th day due to photosynthetic reaction.

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

3.3 Lipid Content and Lipid Productivity

Highest growth rate from each organic carbon source was extracted. Higher lipid content obtained in D-glucose is higher than glycerol. Medium cointained 1000 ppm D-glucose gave 9,7% lipid content, while medium with 600 ppm glycerol gave 7,2% lipid content.

D-glucose 1000 ppm gave higher carbon content than 600 ppm glycerol. Higher C/N ratio in medium influence lipid content [18]. When nitrogen in medium tend to low, Microalgae tend to accumulate higher lipid due to stress environment. Nitrogen is needed to synthesize protein content in biomass. Lack of ratio of C/N will interupt metabolic reaction of cell, and tend to store energy, forming more lipid.

Medium	Growth rate (d ⁻¹)	Biomass content (g/L)	Lipid content (%)	Lipid productivity (mg/L/d)	Source
Digested Dairy Manure	0.474	1.7	14	11.3	[19]
MSG Wastewater	1.803	1.6	14	44	[20]
Artificial Wastewater	0.663	1.7	33	40	[21]
2 nd Municipal WW	0.458	0.67	31	22.9	[22]
40%POME + D-glu	1.406	1.43	9.7	195.02	This study
40%POME + Gly	0.328	0.98	7.3	23.46	This study

Table 3 Comparison of lipid productivity result

Lipid productivity was also calculated. By using 1000 ppm D-glucose and 600 ppm glycerol, lipid productivity reached 29.33 mg/l/day and 13.48 mg/l/day, respectively.

Several researchers also investigated growth of *Chlorella* under mixotrophic condition (Table 2). Highest lipid productivity was recorded from 40% POME + 1000 ppm D-glucose, followed by MSG wastewater.

Due to high price of D-glucose, it is not preferable to commercial production. By cultivate microalgae in POME wastewater, nitrogen content also decreased due to biomass forming. According to Phang & Ong [23], a theoretical microalgae needs 9% nitrogen to form dry biomass. When POME medium contains 113,4 mg/l total nitrogen, 1,4 gr/l *C. vulgaris* aproximately needs about 126 mg/l taken from medium.

BIODIESEL BD.19

International Seminar on Biorenewable Resources Utilization for Energy and Chemicals 2013 In conjunction with Chemical Engineering Seminar of Soehadi Reksowardojo 2013

4 Conclusion

Research was done by cultivating C.*vulgaris* in 40% POME and use different carbon source. Carbon concentration and kind of carbon source influenced in biomass, growth rate, and lipid accumulation. Addition of 1000 ppm D-glucose in medium gave 195.02 mg/l/day, while by using 600 ppm glycerol gave 23.46 mg/l/day lipid productivity. Mixotrophic condition of microalgae cultivation in POME medium could be alternative method to utilize POME and produce biofuel as renewable energy.

Acknowledgements

This research was part of project utilization of POME for microalgae cultivation to produce bioenergy and feed. This work was partially supported by Sobat Bumi Pertamina foundation.
