Running title:

Regulatory approval of new medical devices

23 Contributors:

24 HJM and CJP had equal contribution, and act as guarantors. They were involved in the study
25 conception, acquisition of data, analysis of data, and drafting the manuscript. AHH, and APM
26 were involved in the study conception, acquisition of data, analysis of data, and critical revision
27 of the manuscript. DN, GZY and AD were involved in the study conception and critical revision
28 of the manuscript.

29 Funding:

30 H.J. Marcus was supported by an Imperial College Wellcome Trust Clinical Fellowship, and C.J.
31 Payne was supported by a Wates Foundation Fellowship. A Creative Commons Attribution (CC
32 BY 4.0) is required.

33 Competing interests:

34 All authors have completed the ICMJE uniform disclosure form at
35 www.icmje.org/coi_disclosure.pdf and declare: H.J. Marcus was supported by an Imperial
36 College Wellcome Trust Clinical Fellowship, and C.J. Payne was supported by a Wates
37 Foundation Fellowship; no financial relationships with any organisations that might have an
38 interest in the submitted work in the previous three years; no other relationships or activities that
39 could appear to have influenced the submitted work.

40 Ethical approval:

41 Ethical approval was not required as this study involved information freely available in the
42 public domain.

43 Data sharing:

44 No additional data available.

45 Transparency:

46 The lead authors (the manuscript's guarantors) affirm that the manuscript is an honest, accurate,
47 and transparent account of the study being reported; that no important aspects of the study have
48 been omitted; and that any discrepancies from the study as planned have been explained.

REGULATORY APPROVAL OF NEW MEDICAL DEVICES:**A CROSS SECTIONAL STUDY****ABSTRACT**

Objective: To investigate the regulatory approval of new medical devices.

Design: Cross sectional study of new medical devices reported in the biomedical literature.

Data sources: The PubMed database was searched to identify clinical studies of new medical devices. We searched between the 1st January 2000 and 31st December 2004 to allow time for regulatory approval.

Eligibility criteria for selecting studies: Articles were included if they reported a clinical study of a new medical device and there was no evidence of a previous clinical study in the literature. We defined a medical device according to the FDA as an “instrument, apparatus, implement, machine, contrivance, implant, in vitro reagent, or other similar or related article...”

Main outcome measures: For each clinical study we determined the type of device, target specialty, involvement of academia, and involvement of industry. The FDA medical databases were then searched for clearance or approval relevant to the device.

Results: 5,574 titles and abstracts were screened, 493 full-text articles assessed for eligibility, and 218 clinical studies of new medical devices included. In all, 99/218 (45.4%) of the devices described in clinical studies ultimately received regulatory clearance or approval. These included 510(k) clearance for devices determined to be substantially equivalent to another legally marketed device (78/99; 78.8%), premarket approval (PMA) for high-risk devices (17/99; 17.2%), and others (4/99; 4.0%). Of these, 43 devices (43/99; 43.4%) were actually cleared or approved before a clinical study was published.

Conclusions: We identified a multitude of new medical devices in clinical studies, almost half of which received regulatory clearance or approval. The 510(k) pathway was most commonly used, and clearance often preceded the first published clinical study.

WHAT THIS PAPER ADDS

89 What is already known about the subject:

- 90 – New medical devices have distinct regulatory approval pathways

91 What this study adds:

- 92 – Almost half of the new medical devices described in the literature ultimately receive
93 regulatory clearance or approval
- 94 – The 510(k) pathway is most commonly used, and clearance often precedes the first
95 published clinical study

9
10
11 99 **INTRODUCTION**

12
13
14 100 The introduction of new medical devices is fundamental to the advancement of healthcare.
15 101 Historically, such devices have been adopted with little scientific evidence to support their use.¹
16 102 Although many have greatly improved clinical outcomes, not all devices are beneficial and some
17 103 may be harmful. To this end, most jurisdictions have developed regulatory bodies such as the
18 104 Food and Drug Administration (FDA) that ensure the safety and effectiveness of new medical
19 105 devices.² These regulatory bodies must also act in an efficient and timely manner such that
20 106 patients are not deprived from beneficial innovations.

21
22
23 107 The process by which new high-risk medical devices find their way from bench-to-bedside is
24 108 well established: (1) the development of the device resulting in a first-in-human study, (2) the
25 109 evaluation of the device in clinical trials, culminating in a regulatory approval for use, and (3) the
26 110 adoption of the device.³ While high-risk devices warrant considerable scientific evidence for
27 111 their safety and effectiveness prior to regulatory approval, the pathway for lower risk devices is
28 112 less stringent, allowing for their more rapid approval.⁴⁻⁶

29
30
31 113 The aim of this study was to investigate the use of these distinct regulatory approval pathways
32 114 for new medical devices.

33
34
35 115 **METHODS**

36
37
38 116 We performed a cross sectional study of new medical devices reported in the literature. We
39 117 determined whether or not these devices received regulatory approval, and the relative
40 118 contributions of academia and industry in this process. We identified clinical studies of devices
41 119 before searching for evidence of regulatory approval, allowing us to capture those devices that
42 120 failed to receive approval.

43
44
45 121 We defined a medical device according to the US Food and Drug Administration (FDA) as an
46 122 “instrument, apparatus, implement, machine, contrivance, implant, in vitro reagent, or other

1
2
3 123 similar or related article..." We considered a device as new if there was no evidence of a previous
4
5 124 clinical study in the literature.
6

7
8 125 For each article reporting a clinical study of a new medical device, we defined academia and
9
10 126 industry as involved with the development of the device if a relationship was described in the
11
12 127 article. We considered a device as having regulatory approval if an entry could be found on the
13
14 128 FDA medical device databases.
15

16 129 Patient involvement:
17

18 130 No patients were involved in setting the research question or the outcome measures, nor were
19
20 131 they involved in developing plans for design or implementation of the study. No patients were
21
22 132 asked to advise on interpretation or writing up of results. There are no plans to disseminate the
23
24 133 results of the research to study participants or the relevant patient community.
25

26 134 Search strategy:
27

28
29 135 The PubMed database (NCBI, Maryland, USA) was searched using the Boolean term: (device
30
31 136 OR instrument OR apparatus OR implant OR "in vitro reagent" OR system) AND ("first in man"
32
33 137 OR "first in human" OR "first experience" OR "first clinical" OR "early clinical" OR "early
34
35 138 experience" OR "early human" OR "initial experience" OR "initial clinical" OR "initial human"
36
37 139 OR "preliminary clinical" OR "preliminary experience" OR "preliminary human" OR "Phase 1"
38
39 140 OR "Phase I"). This search term was selected on the basis of efficiency and being able to identify
40
41 141 the most relevant studies. We searched between the 1st January 2000 and 31st December 2004 to
42
43 142 allow time for regulatory approval as previous studies have suggested a long lag between device
44
45 143 development and subsequent regulatory approval.^{7 8}
46

47 144 We included articles that reported a clinical study of a new medical device. We excluded articles
48
49 145 if they only reported a laboratory study of a device because very few such devices ultimately
50
51 146 result in a clinical study.⁹ We also excluded articles if they reported on the novel use of an
52
53 147 existing device, as we expected that most such devices would already have received regulatory
54
55 148 approval.
56

57 149 We estimated based on a pilot study (between 1st January 2000 and 31st July 2000) that this
58
59 150 search strategy would select sufficient articles to allow for meaningful analysis.
60

Regulatory approval of new medical devices

1
2
3 151 Titles and abstracts were initially screened to identify relevant articles (HJM and CJP, checked
4
5 152 by AHH and APM). Articles were excluded if the title or abstract explicitly stated that: the
6
7 153 article was not original research, related to drug development, related to an existing medical
8
9 154 device, or was a laboratory study. Full articles were subsequently obtained and further assessed
10
11 155 for eligibility. In each instance, we reviewed the reference list and searched the PubMed database
12
13 156 using the device name to ensure that we did not miss a related previous clinical study (that would
14
15 157 result in their exclusion). Discrepancies were resolved by consensus.

16
17 158 Medical devices:

18
19 159 For each clinical study of a new medical device we determined the type of device, the target
20
21 160 specialty, the involvement of academia, and the involvement of industry (HJM and CJP, checked
22
23 161 by AHH and APM). The types of device were based on the FDA definition and the target
24
25 162 specialties were drawn from the FDA databases. We considered academia and industry to be
26
27 163 involved in the development of a device if relevant author affiliation, financial support, or
28
29 164 provision of technology was described in the author affiliations, main text, or acknowledgements
30
31 165 of the article. Discrepancies were resolved by consensus.

32
33 166 Regulatory approvals:

34
35 167 For each new medical device we searched the FDA databases for a relevant regulatory clearance
36
37 168 or approval. The FDA recognises several types of regulatory pathway depending on the nature of
38
39 169 the device. Premarket notification [510(k)] is the regulatory pathway if the device is
40
41 170 “substantially equivalent” to a predicate device, and does not necessarily require clinical data.
42
43 171 Premarket approval (PMA) is the regulatory pathway if the device is “not substantially
44
45 172 equivalent”, and requires reasonable evidence of safety and effectiveness. Other regulatory
46
47 173 pathways include humanitarian device exemption (HDE) if the device is for use in patients with
48
49 174 rare diseases or conditions. We searched the FDA 510(k), PMA, and HDE databases using the
50
51 175 device name, applicant name, and relevant keywords (HJM and CJP, checked by AHH and
52
53 176 APM). We also searched GoogleTM (Google Inc., California, USA) for devices that may have
54
55 177 been discontinued, withdrawn, or recalled. Search results were not limited to a date range,
56
57 178 allowing for the identification of regulatory clearance or approval before the first published
58
59
60

1
2
3 179 clinical study. All the searches were performed in August 2015, allowing a minimum of 10 years
4
5 180 from publication to regulatory clearance or approval. Discrepancies were resolved by consensus.
6
7

8 181 Statistical analysis:

9
10 182 We used the Chi-square test to compare differences in regulatory clearance or approval between
11
12 183 the following groups: devices developed by industry alone versus academia alone; devices
13
14 184 developed by both industry and academia versus academia alone; and devices developed by both
15
16 185 industry and academia versus industry alone. First, we compared the proportion of devices
17
18 186 receiving any regulatory clearance or approval (versus no clearance or approval). Second, we
19
20 187 compared the proportion of devices receiving 510(k) clearance (versus any other approval). We
21
22 188 considered differences to be statistically significant if P was less than 0.05. All statistical
23
24 189 analyses were performed using SPSS 22.0 (IBM, New York, USA).

25 190 **RESULTS**

26
27
28 191 Search strategy:

29
30
31 192 In all, 5,574 titles and abstracts were screened, 493 full-text articles assessed for eligibility, and
32
33 193 218 clinical studies of new medical devices included (Figure 1). The corresponding authors
34
35 194 originated from 28 countries, but the majority were located in the USA (70/218; 32.1%) and
36
37 195 Germany (43/218; 19.7%).

38
39 196 Medical devices:

40
41 197 Most of the medical devices reported were instruments (86/218; 39.4%) or implants (79/218;
42
43 198 36.2%) (Table 1). Devices were developed by industry alone (140/218; 64.2%), academia alone
44
45 199 (46/218; 21.1%), or both (32/218; 14.7%).

46
47 200 Regulatory approvals:

48
49
50 201 Of the 218 devices described in clinical studies, 99 (45.4%) ultimately received regulatory
51
52 202 clearance or approval (Table 2). These included 510(k) clearance (78/99; 78.8%), PMA, (17/99;
53
54 203 17.2%), and HDA (4/99; 4.0%).
55
56
57
58
59
60

Regulatory approval of new medical devices

204 Regulatory clearance or approval was granted between April 1997 and September 2014. The
205 median lag between publication of the clinical study and regulatory clearance or approval was 2
206 months (interquartile range -10.8 months to 26.3 months). Of these, 43 devices (43/99; 43.4%)
207 were actually cleared or approved before a clinical study was published; the median lag in these
208 devices was -12.5 months (interquartile range -23.3 months to -6.3 months).

209 Published clinical studies of devices that received regulatory clearance or approval were mostly
210 case series' comprising Level 4 evidence (89/99; 89.9%).

211 Statistical analysis:

212 Devices were more likely to receive regulatory clearance or approval if developed by industry
213 alone compared to academia alone (57.9% vs. 10.9%; $p < 0.001$), or by both industry and
214 academia compared to academia alone (40.6% vs. 10.9%; $p = 0.003$). There was no significant
215 difference in clearance or approval between devices developed by industry alone compared to
216 both industry and academia (57.9% vs. 40.6%; $p = 0.114$).

217 There was no significant difference in the proportion of 510(k) clearance and other approvals
218 that were awarded to industry alone, industry and academia, or academia alone ($p > 0.1$ in all
219 cases).

220 DISCUSSION

221 Principal findings:

222 We identified a multitude of new medical devices in clinical studies, almost half of which
223 received regulatory approval. The 510(k) pathway was most commonly used, and devices often
224 received regulatory clearance before the first published clinical study. The corollary is that many
225 devices cleared for use in patients had no clinical data accessible in the literature to support their
226 use. Published clinical studies were mostly case series' comprising Level 4 evidence. Without
227 high quality clinical data available, informed shared decision-making on the use of new medical
228 devices is difficult if not impossible.

229 The 510(k) pathway is a fast-track system that allows the regulatory approval of a device that is
230 "substantially equivalent" to a predicate device. A device is considered substantially equivalent

1
2
3 231 if: (1) it has the same intended use as the predicate device and (2) it has the same technological
4
5 232 characteristics or, if it has different technological characteristics, information is provided that
6
7 233 demonstrates that it is at least as safe and effective as the predicate device. Clinical studies are
8
9 234 therefore not usually required.

10
11 235 The introduction of a device after it has been cleared through the 510(k) pathway is usually
12
13 236 unstructured and variable.² A device may be introduced in the form of a research study but, more
14
15 237 frequently, may be published as a non-comparative trial without special institutional board
16
17 238 review. Although many such devices are safe and effective, the dangers of this process are
18
19 239 obvious and have been reported.¹⁰⁻¹³ The Balliol Collaboration has proposed the IDEAL model
20
21 240 for safe innovation to address this shortfall, the central tenet being that innovation and evaluation
22
23 241 can and should proceed together in an ordered and logical manner.^{2 14-18} Moreover, the FDA has
24
25 242 recognised the need for reform and has announced a new vision for post market surveillance of
26
27 243 new devices.¹⁹

28 244 Industry was found to have a role in the development and regulatory approval of the majority of
29
30 245 devices identified. For devices developed in academia collaboration with industry was associated
31
32 246 with greater regulatory approval. Interestingly, the proportion of 510(k), PMA and other
33
34 247 approvals that were awarded to industry and academia were comparable, suggesting that the
35
36 248 greater regulatory approvals of devices developed by industry did not simply reflect a propensity
37
38 249 for less disruptive and lower risk innovations. This finding supports efforts such as the Medical
39
40 250 Device Innovation Consortium (MDIC) that facilitate collaboration among academia and
41
42 251 industry in order to foster technology transfer.²⁰ Collaboration between academia and industry
43
44 252 may also contribute to improved surveillance of devices after they receive regulatory approval.

45 253 Comparison with other studies:

46
47 254 In keeping with the present study, several other groups have also found limited publically
48
49 255 available evidence to support the regulatory clearance and approval of new devices. Zuckerman
50
51 256 et al evaluated the types of scientific evidence used to support devices cleared using the 510(k)
52
53 257 pathway.⁵ Of the 50 devices included, 8 had data to support the claim they were substantially
54
55 258 equivalent to a predicate device, and only 3 had data on safety or effectiveness. Chang et al
56
57 259 found that even devices approved using the PMA pathway, which require considerably more
58
59
60

Regulatory approval of new medical devices

1
2
3 260 scientific evidence, often had no published clinical trials.²¹ When trials are published,
4
5 261 comparators are often absent, and details may differ substantially from the data submitted to the
6
7 262 FDA.^{21 22}
8

9
10 263 In a previous study we investigated the translation of new devices from the laboratory to first-in-
11 264 human studies⁹. In contrast to the present study we found that clinical rather than industry
12
13 265 collaboration was the most important predictor of success; devices developed with clinical
14
15 266 collaboration were over six times more likely to lead to a first-in-human study than those
16
17 267 without. It is likely that this incongruity is the result of the varying role of clinical and industry
18
19 268 collaboration through the device development pathway; early clinical studies may be more
20 269 reliant on clinicians, and later regulatory approval more reliant on industry.
21

22
23 270 Limitations:

24
25 271 We recognise several limitations to this study. We restricted our analysis to clinical studies of
26
27 272 new medical devices reported in the biomedical literature. It is likely that the publication
28
29 273 practices of academia and industry vary. We speculate that academia may be more motivated to
30
31 274 publish early clinical studies.
32

33 275 Our analysis may also have favoured more novel devices, which clinicians might have thought
34
35 276 warranted publication in the biomedical literature. The proportion of devices cleared through the
36
37 277 510(k) pathway was therefore likely to be an underestimate.
38

39 278 We determined whether a device had regulatory approval using only the FDA medical device
40
41 279 databases. The proportion of medical devices receiving regulatory approval was therefore also
42
43 280 undoubtedly an underestimate, in particular it is likely that licenses were granted from the
44
45 281 European Union which does not require any evidence of clinical value.¹¹ The reason for selecting
46
47 282 the FDA, rather than other licensing authorities, was because the FDA provides public databases
48
49 283 and search engines that allowed for a systematic search strategy, the FDA acts as the central
50
51 284 body for all medical devices receiving regulatory approval in the USA, and the USA represents
52
53 285 the largest medical device market in the world. We hypothesise that most of the manufacturers of
54
55 286 devices that received regulatory approval from another jurisdiction would have ultimately sought
56
57 287 and obtained FDA approval within the timeframe of this study if they were successful.
58
59
60

1
2
3 288 We evaluated the contributions of academia and industry in the development of a device if a
4
5 289 relationship was described in the author affiliations, main text, or acknowledgements of the first
6
7 290 published clinical study. We acknowledge that our cross-sectional study design does not capture
8
9 291 potential interactions between academia and industry during the early device development phase,
10
11 292 such as the creation of spinout companies, or the licensing of intellectual property to industry.
12
13 293 This study does not identify why industry was superior in obtaining regulatory approval
14
15 294 compared to academia alone. One possible explanation is that the profit-seeking motive of
16
17 295 industry hones their choice as to which devices are pursued.

18 296 Conclusions:

19
20
21 297 The optimal framework for the regulatory approval of medical innovations remains unclear. This
22
23 298 study suggests that many new devices do receive regulatory approval, but often lack clinical trial
24
25 299 data supporting their safety and effectiveness.

26
27 300 The IDEAL model makes several proposals for the staged introduction of innovations in surgery
28
29 301 (and other disciplines that offer complex interventions), including randomised controlled trials to
30
31 302 assess safety and effectiveness. At present, few relevant randomised controlled trials are
32
33 303 published, and fewer still meet current quality standards for optimal reporting. Changes in the
34
35 304 regulatory approval of devices that would require trials for proof of safety and effectiveness
36
37 305 might promote adherence to the IDEAL model.

Confidential: For Review Only

SUPPLEMENT

Table 1. Devices identified that received regulatory approval. * The Oxford 2011 Levels of Evidence

Device	Article title	Journal	Year	Evidence	Level of evidence*
Talent abdominal stent graft system	Early experience with the Talent stent-graft system for endoluminal repair of abdominal aortic aneurysms.	Tex Heart Inst J	2000	Case series (n > 120)	Level 4
Cryogen cryosurgical system	Endometrial cryoablation with ultrasound visualization in women undergoing hysterectomy.	J Am Assoc Gynecol Laparosc	2000	Case series (n = 10)	Level 4
Debakey VAD	First clinical experience with the DeBakey VAD continuous-axial-flow pump for bridge to transplantation.	Circulation	2000	Case series (n = 2)	Level 4

Regulatory approval of new medical devices

Siemens magnetom 0.2T concerto	Interventional MRI-guided brain biopsies using inductively coupled surface coils.	Magn Reson Med	2000	Case series (n = 26)	Level 4
Plateletworks	Clinical evaluation of a new, point-of-care hemocytometer.	Crit Care Med	2000	Cross sectional study (n = 345)	Level 2
SMART nitinol stent system	Endovascular stenting for carotid artery stenosis: preliminary experience using the shape-memory- alloy-recoverable-technology (SMART) stent.	AJNR Am J Neuroradiol	2000	Case series (n = 4)	Level 4
HomMed sentry, Model 1 sentry	Emergence of electronic home monitoring in chronic heart failure: rationale, feasibility, and early results with the HomMed Sentry-Observer system.	Congest Heart Fail	2000	Non-randomised controlled cohort study (n = 53)	Level 3

Smith & Nephew HandPort system	Hand-assisted laparoscopic surgery (HALS) with the HandPort system: initial experience with 68 patients.	Ann Surg	2000	Case series (n = 68)	Level 4
EBI Omega 21 system	Biomechanical evaluation and preliminary clinical experience with an expansive pedicle screw design.	J Spinal Disord	2000	Case series (n = 14)	Level 4
MR elastography	High-resolution tensor MR elastography for breast tumour detection.	Phys Med Biol	2000	Case series	Level 4

Gore helex™ septal occluder	Helex Septal Occluder for Closure of Atrial Septal Defects.	Curr Interv Cardiol Rep	2000	Case series (n = 28)	Level 4
Atlantis anterior cervical plate system	The management of one-level anterior cervical corpectomy with fusion using Atlantis hybrid plates: preliminary experience.	J Spinal Disord	2000	Case series (n = 8)	Level 4
P.D. access (percutaneous doppler) vascular access device	Gaining vascular access in pediatric patients: use of the P.D. access Doppler needle.	Catheter Cardiovasc Interv	2000	Case series (n = 39)	Level 4
Photon DR implantable cardioverter defibrillator (ICD)	Initial clinical experience with a dual chamber rate responsive implantable cardioverter defibrillator.	Pacing Clin Electrophysiol	2000	Case series (n = 57)	Level 4

7

Regulatory approval of new medical devices

Aescula LV model 1055K	Initial clinical experience with a new self-retaining left ventricular lead for permanent left ventricular pacing.	Pacing Clin Electrophysiol	2000	Case series (n = 13)	Level 4
Vasca LifeSite Hemodialysis Access System	Initial clinical results with the LifeSite Hemodialysis Access System.	Kidney Int	2000	Case series (n = 23)	Level 4
Omniport	Laparoscopic hand-assisted surgery for hepatic and pancreatic disease.	Surg Endosc	2000	Case series (n = 14)	Level 4
Ophthalmic medical laser system	Laser trabeculodissection with a photopolishing scanning excimer laser.	Ophthalmic Surg Lasers	2000	Case series (n = 8)	Level 4
SimpliCT	Potential of a new laser target system for percutaneous CT-guided nerve blocks: technical note.	Neuroradiology	2000	Case series (n = 8)	Level 4

Easytrak coronary venous steroid-eluding single-electrode	Transvenous left ventricular lead implantation with the EASYTRAK lead system: the European experience.	Am J Cardiol	2000	Case series (n = 186)	Level 4
Medtronic AVE solstice temporary occlusion balloon system	Balloon-assisted coil placement in wide-necked cerebral aneurysms: preliminary clinical experience.	Neurol Med Chir (Tokyo)	2000	Case series (n = 7)	Level 4
Leksell gamma knife target system, model 24001	First clinical experience with the automatic positioning system and Leksell gamma knife Model C. Technical note.	J Neurosurg	2000	Case series (n = 50)	Level 4

Niti-s stent & introducer, model eoxxxx	Polyurethane-covered self-expandable nitinol stent for malignant biliary obstruction: preliminary results.	Cardiovasc Intervent Radiol	2002	Case series (n = 10)	Level 4
Artificial cervical disc	Preliminary clinical experience with the Bryan Cervical Disc Prosthesis.	Neurosurgery	2002	Case series (n = 60)	Level 4
The auto suture MIBB system	Stereotactic breast biopsy with an 8-gauge, directional, vacuum-assisted probe: initial experience.	Eur Radiol	2002	Case series (n = 138)	Level 4
Biorigid nail femur (BNF)	["Biorigid" interlocking after unreamed intramedullary nailing of tibial shaft fractures].	Unfallchirurg	2002	Case series (n = 76)	Level 4

18

Regulatory approval of new medical devices

Macropore hydrosorb spine system	Resorbable polymer implants in unilateral transforaminal lumbar interbody fusion.	J Neurosurg	2002	Case series (n = 60)	Level 4
Boston scientific filterwire ex embolic	Initial clinical experience with distal protection using the FilterWire in patients undergoing coronary artery and saphenous vein graft percutaneous intervention.	Catheter Cardiovasc Interv	2002	Case series (n = 35)	Level 4
Storz millennium microsurgical system high speed vitrectomy system	Initial experience using the transconjunctival sutureless vitrectomy system for vitreoretinal surgery.	Ophthalmology	2002	Case series (n = 33)	Level 4

Eg-3630ur, ultrasund video gastroscope	Initial experience with an electronic radial array echoendoscope: randomized comparison with a mechanical sector scanning echoendoscope in humans.	Gastrointest Endosc	2002	Cross sectional study (n = 14)	Level 2
Bodyfix	A novel vacuum device for extremity immobilisation during digital angiography: preliminary clinical experiences.	Eur Radiol	2002	Non randomised controlled cohort (n = 100)	Level 3
Setpoint endovascular temperature management system	Initial experience with a novel heat-exchanging catheter in neurosurgical patients.	Anesth Analg	2002	Case series (n = 8)	Level 4
HTS coil	Superconducting RF coils for clinical MR imaging at low field.	Acad Radiol	2003	Cross sectional study	Level 2

20

Regulatory approval of new medical devices

Safe-cross deflecting catheter, model c114nd1	Initial experience and safety in the treatment of chronic total coronary occlusions with a new optical coherent reflectometry-guided radiofrequency ablation guidewire.	Am J Cardiol	2003	Case series (n = 13)	Level 4
Tissuelink monopolar floating ball	Early experience employing a linear hepatic parenchyma coagulation device.	J Hepatobiliary Pancreat Surg	2003	Case series (n = 7)	Level 4
Endoscopic plication system	Endoscopic full-thickness plication: the device, technique, pre-clinical and early clinical experience.	Gastrointest Endosc Clin N Am	2003	Case series (n = 6)	Level 4

Surgical sealant	Feasibility study of NeoMend, a percutaneous arterial closure device that uses a nonthrombogenic bioadhesive.	AJR Am J Roentgenol	2003	Case series (n = 26)	Level 4
Daum-lectric MRI drilling machine	Magnetic resonance-guided transcortical biopsy of bone marrow lesions using a magnetic resonance imaging-compatible piezoelectric power drill: preliminary experience.	Invest Radiol	2003	Case series (n = 17)	Level 4
Spy intra-operative imaging system: sp2000	Preliminary experience with a novel intraoperative fluorescence imaging technique to evaluate the patency of bypass grafts in total arterial revascularization.	Ann Thorac Surg	2003	Case series (n = 84)	Level 4

Regulatory approval of new medical devices

CV232 sre pre-rolled acrylic intraocular lens	Deep sclerectomy with a nonabsorbable implant (T-Flux): preliminary results.	Can J Ophthalmol	2003	Case control study (n = 25)	Level 4
Reform peripheral catheter system, model 02200; reform peripheral catheter, model 02406	Initial experience with a new 8 French-compatible directional atherectomy catheter: immediate and mid-term results.	Catheter Cardiovasc Interv	2003	Case series (n = 77)	Level 4
Surgifrost 10 cm cryosurgical device plus frostbyte clamp and cryosurgical console	Intraoperative left atrial ablation (for atrial fibrillation) using a new argon cryocatheter: early clinical experience.	Ann Thorac Surg	2003	Case series (n = 28)	Level 4
Attain 6218a-am amplatz guide catheter for left-heart delivery	New catheter design for cannulation of the anomalous right coronary artery arising from the left sinus of valsalva.	Catheter Cardiovasc Interv	2003	Case series (n = 5)	Level 4

Regulatory approval of new medical devices

1 2 3 4 5 6 7 8 9 10	Neuroform™ microdelivery stent system	Preliminary experience using the Neuroform stent for the treatment of cerebral aneurysms.	Neurosurgery	2004	Case series (n = 18)	Level 4
11 12 13 14 15 16 17 18 19 20	Trellis infusion system (10cm infusion length); trellis infusion system (20cm infusion length)	Clinical and economic evaluation of the trellis thrombectomy device for arterial occlusions: preliminary analysis.	J Vasc Surg	2004	Case series (n = 26)	Level 4
21 22 23 24 25 26 27 28	ATS 3f aortic bioprosthesis	Early clinical experience with a new tubular equine pericardial stentless aortic valve.	Heart Surg Forum	2004	Case series (n = 24)	Level 4
29 30 31 32 33 34 35 36 37 38	Portaclamp	Early experience with a new aortic clamping system designed for port access cardiac surgery: the PortaClamp.	Heart Surg Forum	2004	Case series (n = 20)	Level 4

24

1 2 3 4 5 6 7 8 9 10 11 12	Silverhawk peripheral plaque excision system, models 02550,04800, 05200, 02406, 04706, 04300	Early experience with a novel plaque excision system for the treatment of complex coronary lesions.	Catheter Cardiovasc Interv	2004	Case series (n = 10)	Level 4
13 14 15 16 17 18 19 20 21 22 23	Corlink AAD (3.5 to 6.0 m m outer diameter vessels),model 200-064, corlink aad (2.0 to 4.0 mm outer diameter vessels), m	Initial experience of an automated anastomotic distal device in off-pump CABG.	Heart Surg Forum	2004	Case series (n = 14)	Level 4
24 25 26 27 28 29 30 31 32	Abiocor® Implantable Replacement Heart	Initial experience with the AbioCor implantable replacement heart system.	J Thorac Cardiovasc Surg	2004	Case series (n = 7)	Level 4
33 34 35 36 37 38 39 40 41 42	Medamicus flowguard peelable introducer	Preliminary evaluation of a valved introducer sheath for the insertion of tunneled hemodialysis catheters.	Semin Dial	2004	Case series (n = 15)	Level 4

Regulatory approval of new medical devices

Levitronix centrimag extracorporeal blood pumping system, model l-100	The CentriMag: a new optimized centrifugal blood pump with levitating impeller.	Heart Surg Forum	2004	Case series (n = 11)	Level 4
Outback catheter	The outback catheter: a new device for true lumen re-entry after dissection during recanalization of arterial occlusions.	Cardiovasc Intervent Radiol	2004	Case series (n = 10)	Level 4
Gambro prismaflex and gambro prismaflex m60 & m100 sets	First clinical trial for a new CRRT machine: the Prismaflex.	Int J Artif Organs	2004	Case series (n = 13)	Level 4
Impella recover LP 2.5 percutaneous cardiac support system	Initial experience with miniature axial flow ventricular assist devices for postcardiotomy heart failure.	Ann Thorac Surg	2004	Case series (n = 6)	Level 4

Biopsy handy, MRI biopsy handy	A new safe and stable spiral wire needle for thoracoscopic resection of lung nodules.	Chest	2004	Case series (n = 13)	Level 4
Contegra® Pulmonary Valved Conduit, Models 200 (unsupported) and 200S (supported)	Contegra pulmonary valved conduits cause no relevant hemolysis.	J Card Surg	2004	Case series (n = 60)	Level 4
Microcuff pediatric endotracheal tube	Tracheal sealing characteristics of pediatric cuffed tracheal tubes.	Paediatr Anaesth	2004	Randomised trial (n = 80)	Level 2
Cardiovention corx system, model FG 0001	A new cardiopulmonary bypass circuit with reduced foreign surface (CorX): initial clinical experience and implications for anaesthesia management.	Eur J Anaesthesiol	2004	Case series (n = 10)	Level 4

Regulatory approval of new medical devices

ACMI vista CTR bipolar loop electrode	First clinical experience with new transurethral bipolar prostate electroresection system: controlled tissue ablation (coblation technology).	J Endourol	2004	Case series (n = 36)	Level 4
MO.MA ultra proximal cerebral protection device, model mus0130069x6	First clinical experiences with an endovascular clamping system for neuroprotection during carotid stenting.	Eur J Vasc Endovasc Surg	2004	Case series (n = 42)	Level 4
1.5T 32-channel head coil and 3T 32-channel head coil	New partially parallel acquisition technique in cerebral imaging: preliminary findings.	Eur Radiol	2004	Case series (n = 6)	Level 4

7 30 **510(k)** is a premarketing submission to demonstrate that a device is as safe and effective, that is “substantially equivalent”, to a legally
8
9 31 market device.
10

11
12 32 **Premarket Approval (PMA)** contains sufficient valid scientific evidence to provide reasonable assurance that the device is safe and
13
14 33 effective for its intended use or uses.
15
16

17
18 34 **Humanitarian Use Device (HUD)** is similar to PMA, but is exempt from the effectiveness requirements; it is intended for devices
19
20 35 that benefit patients with rare disease.
