# Different cation-protonation patterns in molecular salts of unsymmetrical dimethyhydrazine: $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2} \cdot \mathrm{Br}$ and $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2} \cdot \mathrm{H}_{2} \mathrm{PO}_{3}$ 

Judita Katinaite and William T. A. Harrison*

Department of Chemistry, University of Aberdeen, Meston Walk, Aberdeen AB24 3UE, Scotland. *Correspondence e-mail: w.harrison@abdn.ac.uk

We describe the syntheses and crystal structures of two molecular salts containing the 1,1-dimethylhydrazinium cation, namely 1,1-dimethylhydrazin-1ium bromide, $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{Br}^{-}$, (I), and 2,2-dimethylhydrazin-1-ium dihydrogen phosphite, $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{H}_{2} \mathrm{PO}_{3}{ }^{-}$, (II). In (I), the cation is protonated at the methylated N atom and $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds generate [010] chains in the crystal. In (II), the cation is protonated at the terminal N atom and cation-toanion $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and anion-to-anion $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds generate (001) sheets.

## 1. Chemical context

Unsymmetrical dimethylhydrazine (1,1-dimethylhydrazine; $\mathrm{C}_{2} \mathrm{H}_{8} \mathrm{~N}_{2}$; UDMH) is a colourless liquid at room temperature and pressure with a strong and unpleasant ammonia-like or fishy smell. The best known application of this compound is the fuel (reducing agent) in hypergolic rocket fuels (Edwards, 2003), where it can be used alone or mixed with hydrazine: the latter formulation (trade name 'Aerozine 50') was used by the Apollo lunar modules to begin their homeward journeys from the moon.

Chemically, both nitrogen atoms in UDMH bear lone pairs of electrons, which can act as weak bases to accept protons and therefore result in the formation of molecular salts when reacted with acids. The first crystal structure of a UDMH salt was reported by Klapötke et al. (1999), who prepared 1,1dimetylhydrazinium azide as a possible high-energy-density material with military applications; the methylated UDMH nitrogen atom is protonated and the components are linked by strong $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds in the crystal. However, this salt exhibited pronounced hygroscopic behaviour and had a low melting point of 311 K , which deemed it unsuitable for such uses. The nitrate salt of UDMH, which may be a decomposition product of hypergolic fuels, was prepared soon afterwards by the same workers (De Bonn et al., 2001) by a low-temperature, non-aqueous synthesis: anhydrous nitric acid and UDMH were separately dissolved in dichloromethane at 195 K and the solutions mixed at the same temperature. The resulting hygroscopic salt, 1,1-dimethylhydrazinium nitrate, is protonated at the methylated nitrogen atom and features $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds in its crystal structure.
Merkoulov et al. (2005) synthesized 1,1-dimethylhydrazinium chloride by reacting liquid UDMH with HCl dissolved in diethyl ether: its crystal structure consists of two
independent cations and two chloride anions in the asymmetric unit. The cation is protonated at the methylated nitrogen atom and a dense network of strong $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds helps to consolidate the packing in the crystal. A salt with a more complicated counterion was synthesised by Mu et al. (2011): the addition of liquid UDMH to a solution of picric acid in ethanol at room temperature yielded 1,1-dimethylhydrazinium picrate. As before, the UDMH protonates at the methylated nitrogen atom and cation-to-anion $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds help to establish the packing.

(I)

(II)

As an extension of these studies, we now describe the syntheses and crystal structures of 1,1-dimethylhydrazin-1-ium bromide, $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{Br}^{-}$(I) and 2,2-dimethylhydrazin-1-ium dihydrogen phosphite, $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{H}_{2} \mathrm{PO}_{3}{ }^{-}$(II).

## 2. Structural commentary

Compound (I) crystallizes in space group $I 2 / a$ (non-standard setting of $C 2 / c$ ) with one cation and one bromide anion in the asymmetric unit (Fig. 1). The cation is protonated at the central N2 atom, as seen in previous UDMH salts referred to above. The $\mathrm{N} 1-\mathrm{N} 2$ bond length $[1.4478(19) \AA$ ] is slightly shorter than the $\mathrm{C}-\mathrm{N}$ bond lengths $[1.482(2)$ and 1.485 (2) $\AA$ ]. N 2 is displaced from $\mathrm{N} 1, \mathrm{C} 1$ and C 2 by 0.4834 (16) $\AA$ and the $\mathrm{C}-\mathrm{N}-\mathrm{C}$ bond angle $\left[111.38(14)^{\circ}\right]$ is

The molecular structure of (I), showing $50 \%$ displacement ellipsoids. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bond is indicated by a double-dashed line (Table 1 ).

Figure 2
The molecular structure of (II), showing $50 \%$ displacement ellipsoids. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond is indicated by a double-dashed line (Table 2).
slightly greater than the $\mathrm{C}-\mathrm{N}-\mathrm{N}$ angles [108.93 (12) and $\left.108.97(14)^{\circ}\right]$. The H atoms attached to N 1 point away from the carbon atoms $[\mathrm{C} 1-\mathrm{N} 2-\mathrm{N} 1-\mathrm{H} 2 n=-175.7$ (2); $\mathrm{C} 2-$ $\left.\mathrm{N} 2-\mathrm{N} 1-\mathrm{H} 1 n=178.0(2)^{\circ}\right]$ and the $\mathrm{N} 2-\mathrm{H} 3 n$ bond bisects the $\mathrm{N} 1 \mathrm{H}_{2}$ group [ $\mathrm{H} 3 n-\mathrm{N} 2-\mathrm{N} 1-\mathrm{H} 1 n=61(2)^{\circ}$ ].

Compound (II) crystallizes in space group $\mathrm{Pna}_{1}$ with one cation and one dihydrogen phosphite anion in the asymmetric unit (Fig. 2). In this case, the cation is protonated at the terminal N atom rather than the central N atom, which has not been seen previously in UDMH salts. The $\mathrm{N} 1-\mathrm{N} 2$ bond length is 1.454 (3) $\AA$ and the $\mathrm{C}-\mathrm{N}$ bond lengths are 1.462 (3) and 1.463 (3) $\AA$. The geometry about N 2 is pyramidal and this atom is displaced from $\mathrm{N} 1, \mathrm{C} 1$ and C 2 by 0.504 (2) $\AA$. The bond angles about N 2 show the same trend as those in (I): $\mathrm{C}-$ $\mathrm{N}-\mathrm{C}=110.69$ (18); $\mathrm{C}-\mathrm{N}-\mathrm{N}=107.62$ (17) and 107.94 (18) ${ }^{\circ}$. Two of the H atoms attached to N 1 have almost the same locations as the corresponding atoms in (I), whereas the third bisects the $\mathrm{C} 1-\mathrm{N} 2-\mathrm{C} 2$ grouping $[\mathrm{C} 1-\mathrm{N} 2-\mathrm{N} 1-\mathrm{H} 3 n=$ $\left.-62^{\circ}\right]$. In the anion, the $\mathrm{P} 1-\mathrm{O} 3$ bond length of 1.5638 (16) $\AA$ is typical (Harrison, 2003) for the protonated O atom in a dihydrogen phosphite group whereas P1-O1 [1.4982 (15) Å] and $\mathrm{P} 1-\mathrm{O} 2$ [1.5003 (16) $\AA$ ] are almost the same length, indicating the expected delocalization (resonance) of the negative charge over these two O atoms. The $\mathrm{O}-\mathrm{P}-\mathrm{O}$ bond angle for the unprotonated oxygen atoms [116.76(9) ${ }^{\circ}$ ] is significantly larger than the $\mathrm{O}-\mathrm{P}-\mathrm{OH}$ angles [106.37 (9) and $\left.111.46(9)^{\circ}\right]$, as seen previously for similar species (Harrison, 2003). P1 is displaced from its attached O atoms by 0.4510 (13) A.

## 3. Supramolecular features

In the crystal of (I), $\mathrm{N}-\mathrm{H} \cdots$ Br hydrogen bonds (Table 1) link the components into [010] chains (Fig. 3): each $\mathrm{Br}^{-}$ion accepts three $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ bonds and alternating, centrosymmetric $R_{4}^{2}(8)$ and $R_{4}^{2}(10)$ loops occur within the chain. The N 2 bond is significantly shorter than the N1 bonds, which may be due to the positive charge residing on N 2 : this was also observed in the structure of the nitrate salt (de Bonn et al., 2001). There

Symmetry codes: (i) $x+\frac{1}{2},-y+\frac{1}{2}, z$; (ii) $x, y+1, z$.
are also several weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ contacts (Table 1) in (I); the weak and strong interactions result in each bromide ion accepting a total of seven hydrogen bonds (Fig. 4).

The crystal structure of (II) appears to correlate with the novel protonation pattern of the $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+}$cation: the three H atoms attached to N 1 each partake in a strong, near-linear $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond to nearby $\mathrm{H}_{2} \mathrm{PO}_{3}{ }^{-}$anions (Table 2). The anions are linked into [100] chains by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with adjacent anions in the chain related by $a$ glide symmetry. Together, these interactions generate (001) sheets (Fig. 5) As usual (Harrison, 2001), the $\mathrm{P}-\mathrm{H}$ grouping of the anion does not participate in hydrogen bonds and the H atom points into the inter-layer region.

## 4. Database survey

A search of the Cambridge Structural Database (CSD; Groom et al., 2016) revealed the crystal structures of the four UDMH

Figure 3
Partial packing diagram for (I), showing the formation of [010] chains linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds. C-bound H atoms are omitted for clarity. Symmetry codes as in Table 1.

Figure 4
The environment of the bromide ion in the crystal of (I). [Symmetry codes: (i) $\frac{1}{2}-x, \frac{3}{2}-y, \frac{1}{2}-z$; (ii) $\frac{1}{2}-x, \frac{1}{2}-y, \frac{1}{2}-z$; (iii) $-x, \frac{1}{2}+y, \frac{1}{2}-y$; (iv) $x, \frac{3}{2}-y, z-\frac{1}{2}$.] Note that each of the five cations has a different bonding mode: $\eta^{1} \mathrm{~N} 1, \mathrm{~N} 2$ and C 1 and $\eta^{2} \mathrm{~N} 1+\mathrm{C} 1$ and $\mathrm{C} 1+\mathrm{C} 2$.
derivatives cited above: refcodes for the azide, nitrate, chloride and picrate salts are CORRUW, IBOLOA, FOHLUK and AZUXID, respectively.

## 5. Synthesis and crystallization

Caution! UDMH is toxic, potentially carcinogenic and may form explosive mixtures with oxidizing agents: all appropriate

Computer programs: CrystalClear (Rigaku, 2012), SHELXS97 (Sheldrick, 2008), SHELXL2014 (Sheldrick, 2015), ORTEP-3 for Windows (Farrugia, 2012) and publCIF (Westrip, 2010).
safety measures must be put in place when handling this compound.

To prepare (I), aqueous solutions of UDMH ( $10 \mathrm{ml}, 1.0 \mathrm{M}$ ) and hydrobromic acid ( $10 \mathrm{ml}, 1.0 \mathrm{M}$ ) were mixed at room temperature to yield a colourless solution and colourless rods (to $\sim 1 \mathrm{~mm}$ in length) of (I) grew as the solvent evaporated in a watch glass. These crystals are extremely hygroscopic and should be immediately transferred to a desiccator for storage: if left in air, they absorb enough water to completely dissolve within an hour or two.

To prepare (II), aqueous solutions of UDMH ( $10 \mathrm{ml}, 1.0 \mathrm{M}$ ) and phosphorus acid $(10 \mathrm{ml}, 1.0 \mathrm{M})$ were mixed at room temperature to yield a colourless solution and yellowish slabs of (II) grew as the increasingly viscous solvent slowly evaporated over several days in a watch glass. These crystals are hygroscopic and should be stored in a desiccator. IR: $2383 \mathrm{~cm}^{-1}$ ( $\mathrm{P}-\mathrm{H}$ stretch).

The IR spectra of UDMH, (I) and (II) are available as supporting information.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The N-bound H atoms in (I) were located in difference maps and their positions freely refined;
those in (II) were relocated to idealized locations and refined as riding atoms. The O -bound H atom in (II) was located in a difference map and refined as riding, in its as-found relative position. The methyl H atoms were geometrically placed ( $\mathrm{C}-$ $\mathrm{H}=0.98 \AA$ ): the $-\mathrm{CH}_{3}$ groups were allowed to rotate, but not to tip, to best fit the electron density. The constraint $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\text {eq }}$ (carrier) or $1.5 U_{\text {eq }}$ (methyl carrier) was applied in all cases.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Symmetry codes: (i) $-x+1 / 2,-y+1 / 2,-z+1 / 2$; (ii) $-x+1 / 2,-y+3 / 2,-z+1 / 2$; (iii) $-x, y-1 / 2,-z+1 / 2$; (iv) $x,-y+3 / 2, z+1 / 2$.
(II) 2,2-Dimethylhydrazin-1-ium dihydrogen phosphite

## Crystal data

$\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{H}_{2} \mathrm{PO}_{3}{ }^{-}$
$M_{r}=142.10$
Orthorhombic, $\mathrm{Pna2}_{1}$
$a=8.0690$ (2) Å
$b=6.9970(2) \AA$
$c=11.7001(6) \AA$
$V=660.57(4) \AA^{3}$
$Z=4$
$F(000)=304$

## Data collection

$\underset{\text { diffractometer }}{\text { Rigaku Mercury CCD }}$
$\omega$ scans
5347 measured reflections
1395 independent reflections
1365 reflections with $I>2 \sigma(I)$

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.025$
$w R\left(F^{2}\right)=0.065$
$S=1.09$
1395 reflections
77 parameters
1 restraint
$D_{\mathrm{x}}=1.429 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.71073 \AA$
Cell parameters from 4031 reflections
$\theta=3.4-27.5^{\circ}$
$\mu=0.35 \mathrm{~mm}^{-1}$
$T=100 \mathrm{~K}$
Plate, yellow
$0.18 \times 0.18 \times 0.02 \mathrm{~mm}$
$R_{\text {int }}=0.023$
$\theta_{\text {max }}=27.5^{\circ}, \theta_{\text {min }}=3.4^{\circ}$
$h=-8 \rightarrow 10$
$k=-8 \rightarrow 9$
$l=-15 \rightarrow 13$

Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: mixed
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0374 P)^{2}+0.203 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.24 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.28$ e $\AA^{-3}$

Absolute structure: Refined as an inversion twin.
Absolute structure parameter: 0.15 (14)

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refined as a 2-component inversion twin.
