Edited by W. T. A. Harrison, University of Aberdeen, Scotland

In the title one-dimensional coordination polymer,  $[\text{Sn}(\text{CH}_3)_3(\text{C}_8\text{H}_6\text{NO}_4)]_n$ , the  $\text{Sn}^{\text{IV}}$  atom is coordinated by three methyl C atoms and two carboxylate O atoms (one symmetry generated), resulting in an almost regular  $\text{SnC}_3\text{O}_2$  trigonal pyramid. The C atoms occupy the equatorial sites and the O atoms occupy the axial sites. In the ligand, the dihedral angles between the benzene ring and the pendant acetate and nitro groups are  $57.7(1)$  and  $36.9(3)^\circ$ , respectively. The bridging ligand leads to [010] chains in the crystal, with adjacent metal atoms related by a  $2_1$  screw axis. A weak  $\pi$ - $\pi$  interaction exists between the centroids of symmetry-related benzene rings at a distance of  $3.9131(19)$  Å.

**Keywords:** crystal structure; one-dimensional coordination polymer; tri-methyltin(IV) complex;  $\pi$ - $\pi$  interaction.

**CCDC reference:** 1046314

## Crystal structure of *catena*-poly[[trimethyltin(IV)]- $\mu$ -2-(2-nitrophenyl)acetato- $\kappa^2$ O:O']

Muhammad Danish, Muhammad Nawaz Tahir, Sana Iftikhar, Muhammad Asam Raza and Muhammad Ashfaq

### S1. Comment

The tin complex (I), (Fig. 1) is in continuation of synthesizing various metal complexes with (2-nitrophenyl)acetic acid. In this context, we have reported the cobalt complex namely "Tetraaquabis((2-nitrophenyl)acetato-O) cobalt(II)" (Danish *et al.*, 2015).

The crystal structures of *catena*-Poly[[trimethyltin(IV)]- $\mu$ -2-(2-chlorophenyl) acetato] (Wen *et al.*, 2009), *catena*-[bis-( $\mu$ -2-(2-fluorophenyl)-2-methylprop-2-enoato)-hexamethyl-di-tin] (Tariq *et al.*, 2013), *catena*-poly[[trimethyltin(IV)]- $\mu$ -2-(3-thienyl)acetato] (Yang *et al.*, 2009), *catena*-(( $\mu$ -2-(3-benzoylphenyl)propanoato)-) trimethyl-tin(iv)) (Tahir *et al.*, 1997a), {2-[(2,3-Dimethylphenyl)amino] benzoato-*O:O'*} trimethyltin(IV) (Tahir *et al.*, 1997b) have been published which are related to the title compound due to coordination around the tin.

The Sn atom has a distorted trigonal bipyramidal geometry. The basal plane consists of three methyl groups and the apical position are occupied by the O-atoms of two carboxylate ligands. The Sn atom is 0.1082 (20) Å out of the equatorial plane towards the more strongly bound O1 atom. The Sn—O bond lengths are significantly different [Sn1—O1 2.197 (2) and Sn1—O2 2.359 (2) Å]. In the asymmetric unit the acetato moiety *A* (O1/C4/C5/O2), benzene ring *B* (C6—C11) are planar with r.m.s. deviation of 0.0020 and 0.0059 Å, respectively. The dihedral angle between *A/B* is 57.727 (115)°. The nitro group is oriented at a dihedral angle of 36.896 (298)° with the benzene ring. The molecules form one-dimensional polymeric chains (Fig. 2) running along the crystallographic *b*-axis. There exist a  $\pi$ - $\pi$  interaction between  $Cg1 \cdots Cg1^i$  [ $i = 1 - x, -y, -z$ ] at a distance of 3.9131 (19) Å, where *Cg1* is the centroid of benzene ring.

### S2. Experimental

The silver salt (1.44 g, 0.01 *M*) of 2-nitrophenyl acetic acid was suspended in 50 ml chloroform in a round bottom flask equipped with condenser and magnetic stirrer. Trimethyltin chloride (0.995 g, 0.01 *M*) in 5 ml of chloroform was added under inert atmosphere and reflux the reaction mixture for 4 h. The reaction mixture was allowed to cool to room temperature and stayed overnight then filtered. The residue was washed with chloroform and collected. It was concentrated on rotary evaporated and kept for crystallization. Colourless prisms were obtained after a week.

### S3. Refinement

The H atoms were positioned geometrically (C—H = 0.93—0.97 Å) and refined as riding with  $U_{iso}(H) = xU_{eq}(C)$ , where  $x = 1.5$  for methyl and  $x = 1.2$  for other H-atoms.

*Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.025$	H-atom parameters constrained
$wR(F^2) = 0.057$	$w = 1/[\sigma^2(F_o^2) + (0.0174P)^2 + 4.9157P]$
$S = 1.10$	where $P = (F_o^2 + 2F_c^2)/3$
3070 reflections	$(\Delta/\sigma)_{\text{max}} = 0.002$
157 parameters	$\Delta\rho_{\text{max}} = 0.74 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.53 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
