Near Earth Asteroid (NEA) Scout Overview

The Near Earth Asteroid Scout Will

- Image/characterize a NEA during a slow flyby
- Demonstrate a low cost asteroid reconnaissance capability

Key Spacecraft & Mission Parameters

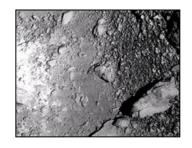

- 6U cubesat (20 cm X 10 cm X 30 cm)
- ~86 m² solar sail propulsion system
- Manifested for launch on the Space Launch System (EM-1/2018)
- Up to 2.5 year mission duration
- < 1 AU maximum distance from Earth

Leverages: Combined experiences of MSFC (PM, SE, Solar Sail, AMT, G&C, and Mission Operations) and JPL (Flight System Bus, Instrument, Science) with support from GSFC, JSC, and LaRC

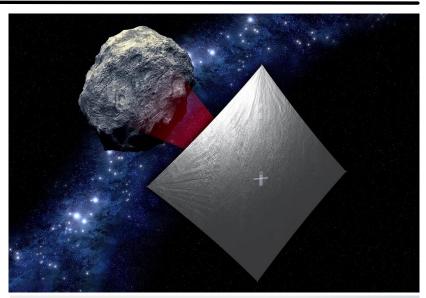

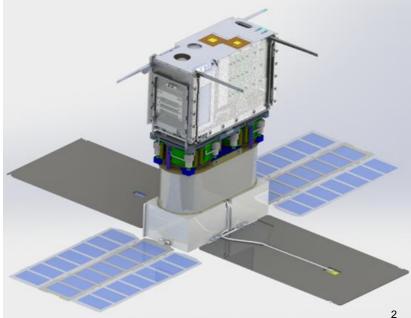

Target Reconnaissance with medium field imaging Shape, spin, and local

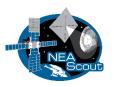

environment

Close Proximity Imaging Local scale morphology, terrain properties, landing site survey

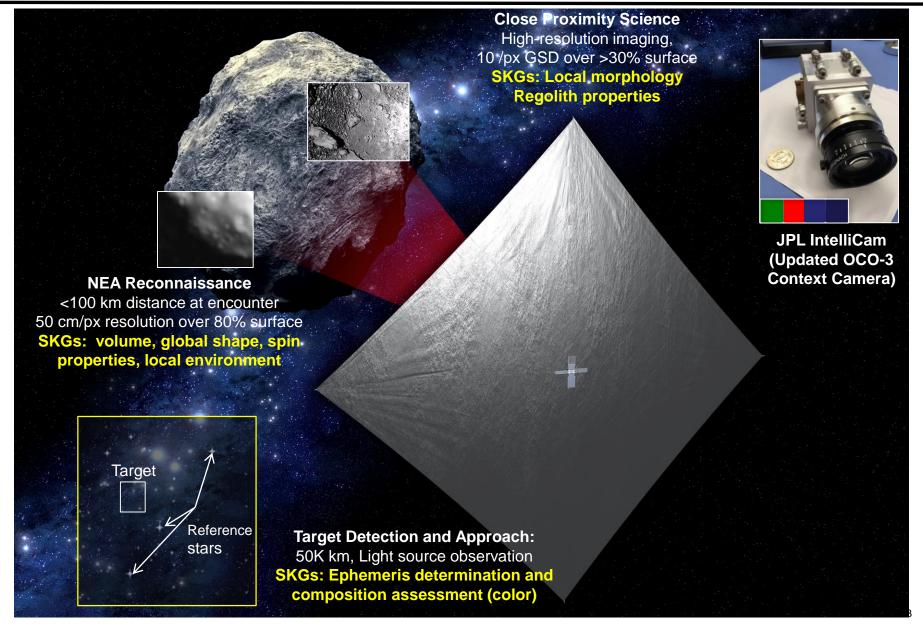

NEA Scout Science

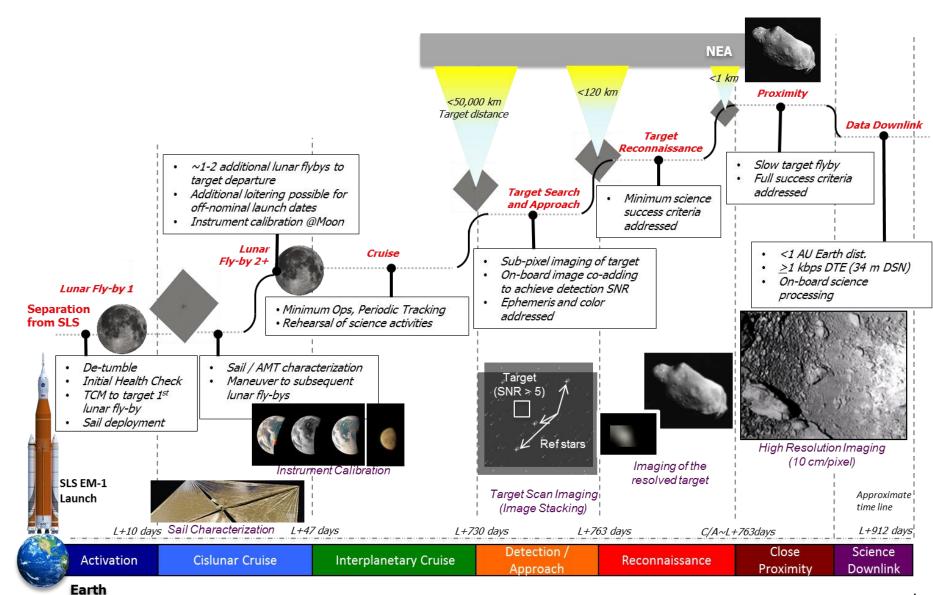

Mission ConOps

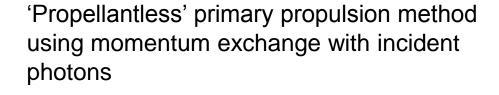

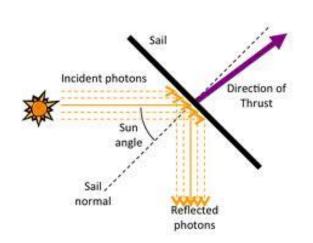

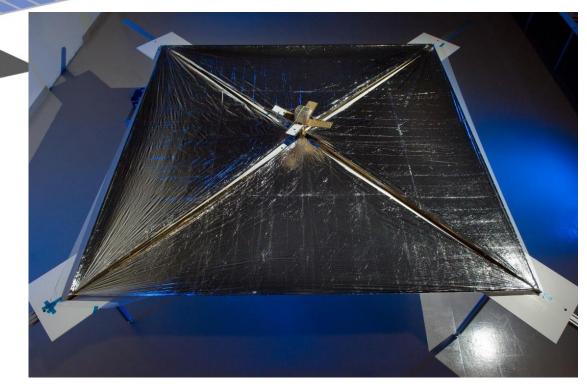

NEA Scout Solar Sail Technology

Leverages MSFC NanoSail-D (2010) and collaborate arrangements with the Planetary Society and University of Surrey

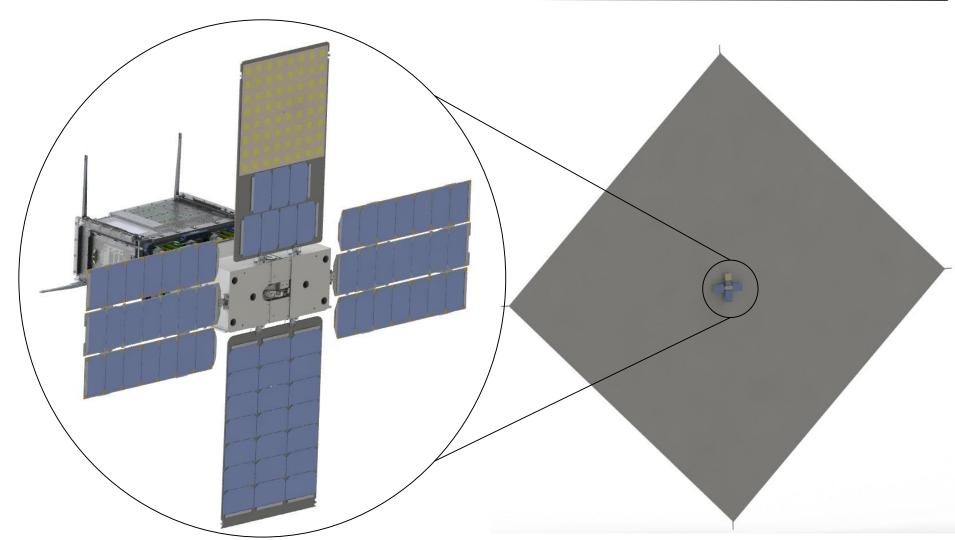

Flight System Configuration – Deployed

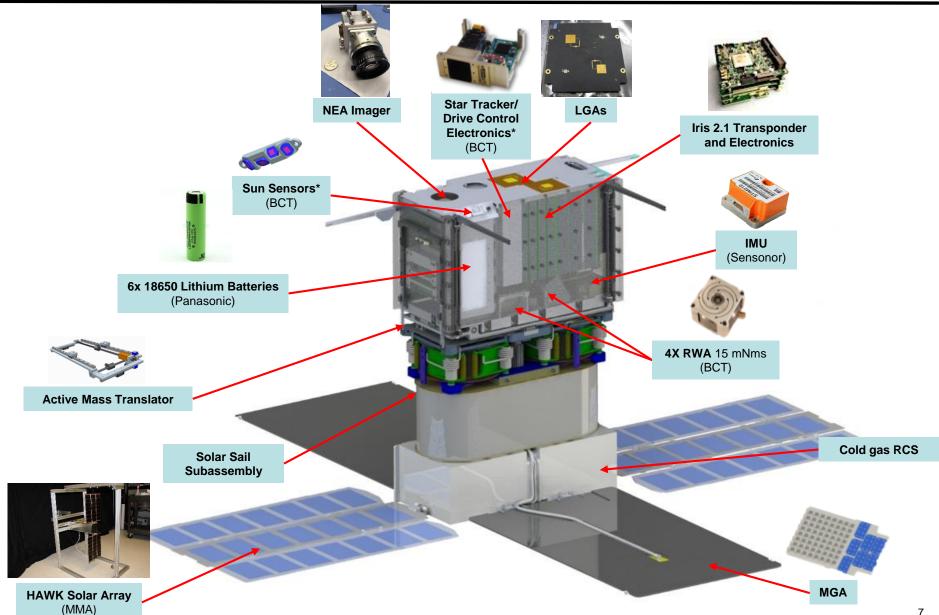

Flight System Overview

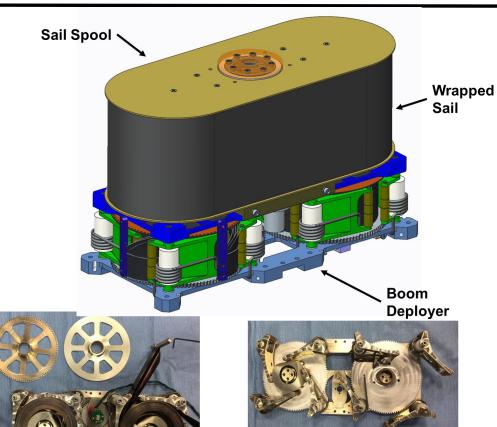

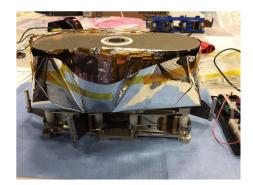

Solar Sail Mission Implementation Challenges

- Solar Sail transient deployment event and ground testing
- Persistent generation of strong disturbance torques with limited expendable propellant
- Need for robust ADCS to enable trajectory, Earthpointing slews, and NEA detection/SKG science objectives
- Predictable thrust modeling

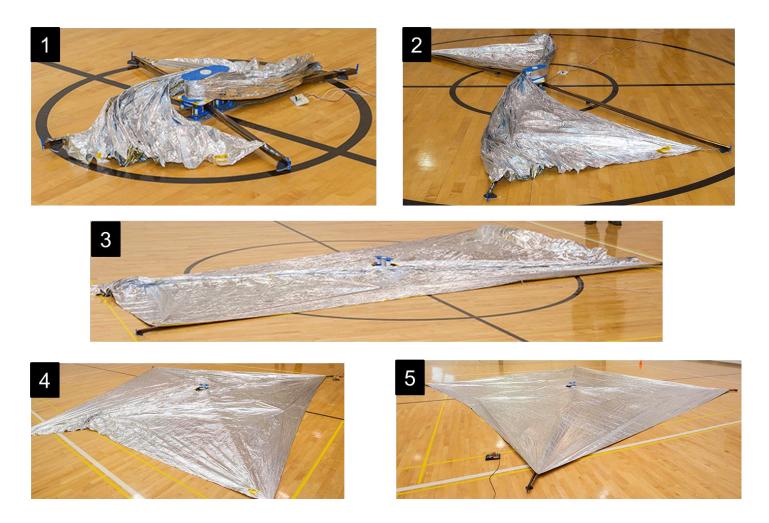

Transient Solar Sail Deployment – Shape Phases

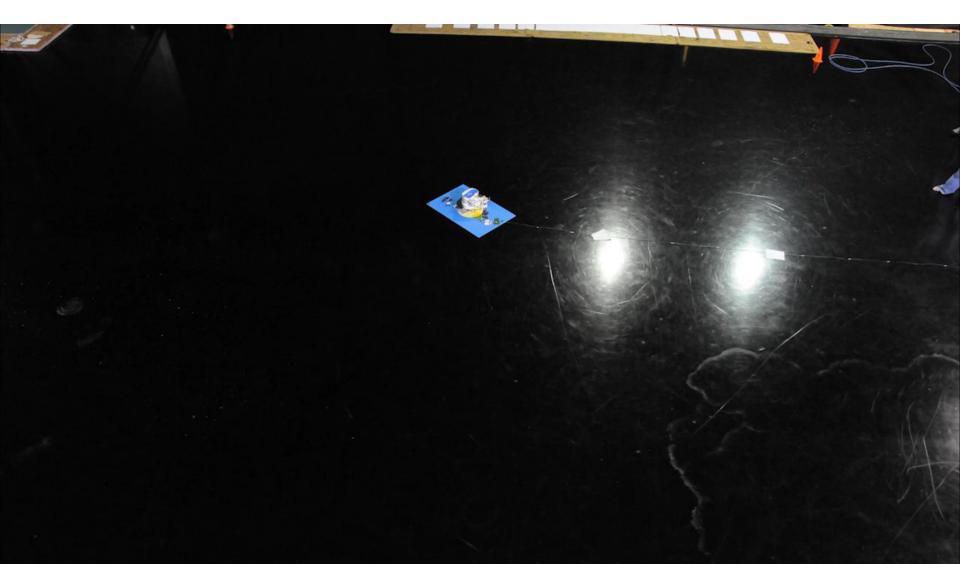

Single sail membrane drives initial 'bow tie' effect: Booms are do not maintain 90deg relative orientation (less predictable induced disturbance force) and direct sunlight on booms drive significant thermal deflections

1st Full Scale Solar Sail Ground Deployment

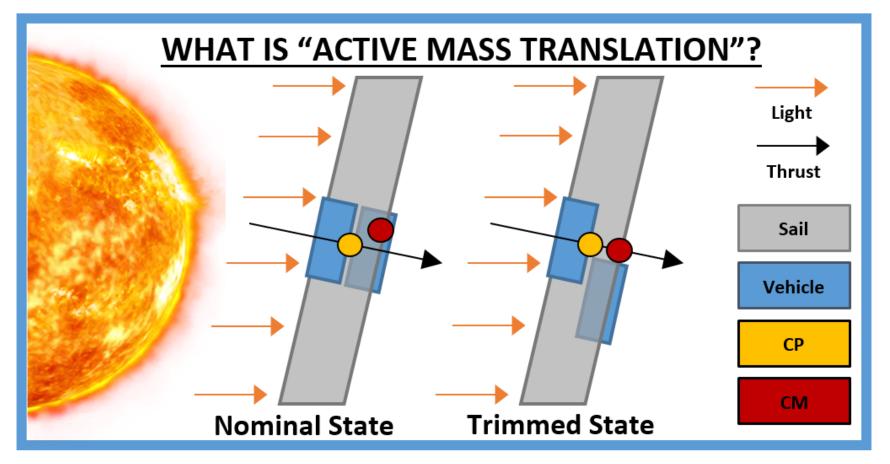

Disturbance Torques: Active Mass Translator (AMT)

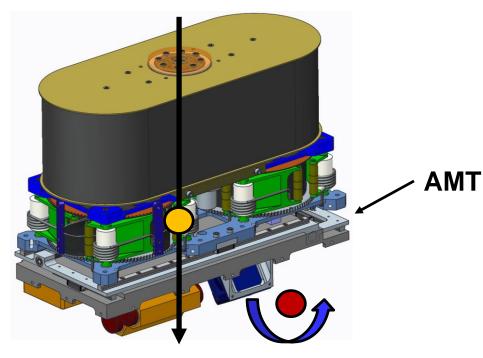

Relative adjustment of part of the spacecraft relative to the other to alter the inertial properties of the vehicle and align the Solar Sail Center-of-Pressure (CP) and Center-of-Mass (CM)

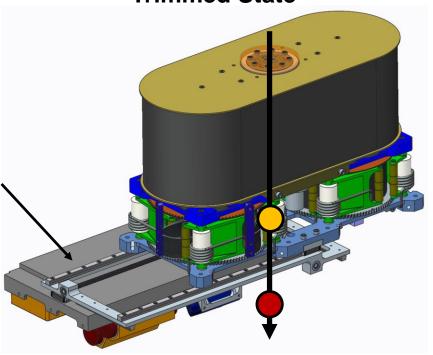

Disturbance Torques: Active Mass Translator (AMT)

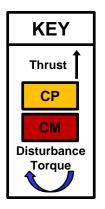

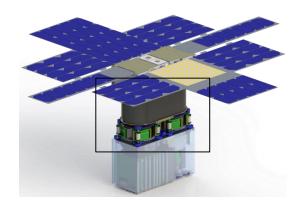

Trimmed State

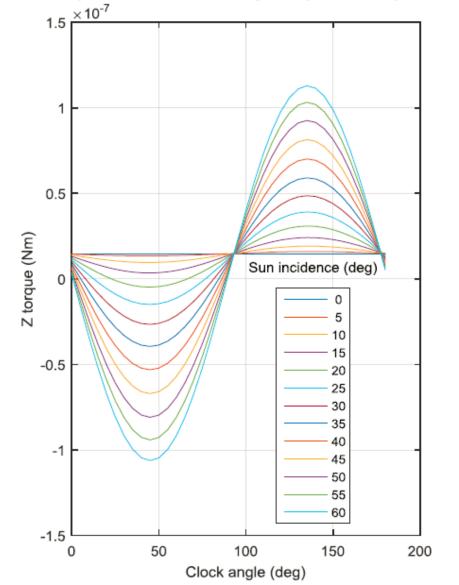

ADCS: Z-Momentum Build-up

- AMT does not completely eliminate 'windmill' torque about sail normal
- Generated torque varies with roll ('clock') angle and solar angle of incidence (AOI)
- <20deg AOI, RCS must be used for Z-momentum desaturation
- >20deg AOI, clock angle can be adjusted to manage or minimize accumulation of Zmomentum
- Underscores importance of characterization period early in the mission

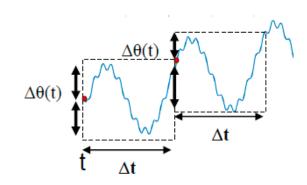

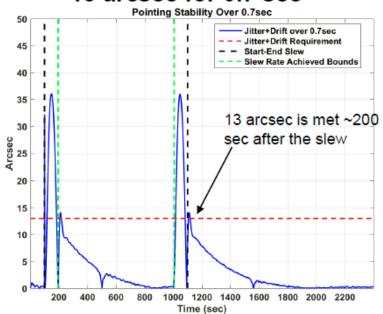

ADCS: Pointing Stability

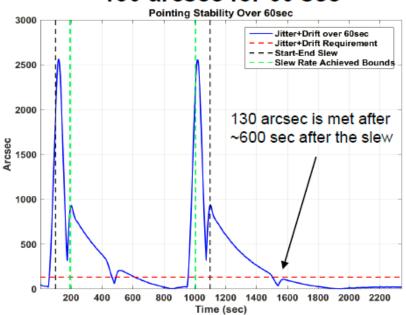

- Pointing Stability Requirements
 - Jitter + Drift < 13 arcsec for 0.7 sec
 - Jitter + Drift < 130 arcsec for 60 sec
- Drift+Jitter amplitudes: maximum control error during an exposure time ∆t, during and after a slew at maximum slew rate of 0.1 deg/sec

13 arcsec for 0.7 sec

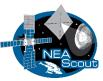

130 arcsec for 60 sec

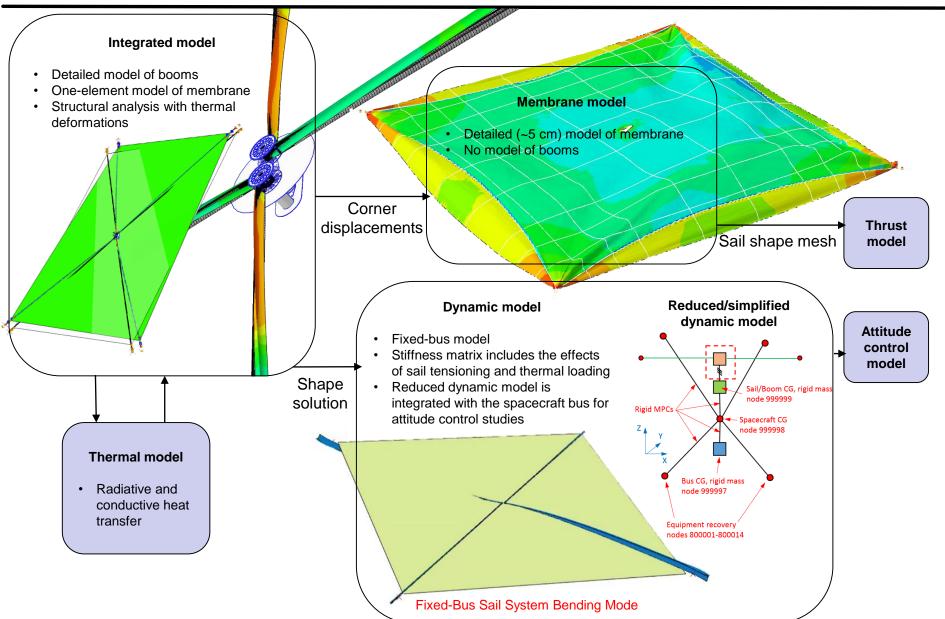

Pointing stability requirements are met after a settling time of:

- ~200 sec for 13 arcsec in 0.7 sec
- ~600 sec for 130 arcsec in 60 sec

Solar Sail Thrust Model and Analysis Flowchart

Summary & Project Status

Summary

- Numerous challenges exist in implementing a Solar Sail mission, particularly within a CubeSat form factor
- Extensive design, analysis, and testing has been performed to-date to address these challenges
- Difficulty in validating analytical models and performing ground (1G) demonstrations given gossamer nature of Solar Sails
- NEA Scout flight on SLS EM-1 flight opportunity (2018) will provide a giant leap forward in clarifying our understanding of Solar Sail modeling and performance

♦ Project Status

- On track for August Design Review with significant flight procurements to follow
- Flight System integration starts June 2017
- Manifested on SLS EM-1 for 2018 deep space flight opportunity
- NEA flyby anticipated in 2021

AMT Design and Breadboarding

- Breadboarding hardware development as proof-of-concept
- EDU hardware in development for environmental testing and wire harness implementation

Thrust Model: Underlying Physics

- Flat Plate optical model published in Wright and cited by McInnes
- Shows tangential and normal components
- ◆ Tangential component important to torque

P = solar pressure

A = area

 \tilde{r} = total reflectivity

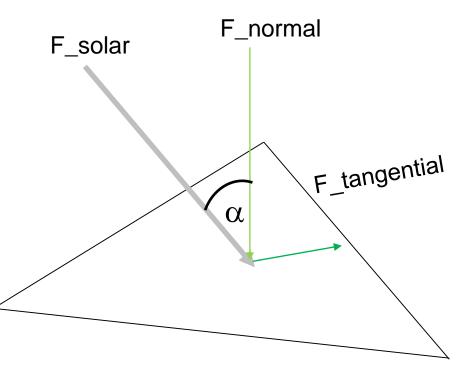

s = fraction of reflection that is specular

 α = sun incidence angle

Bf, Bb = front and back side non-Lambertian

coefficients

ef, eb = front and back side emissivities

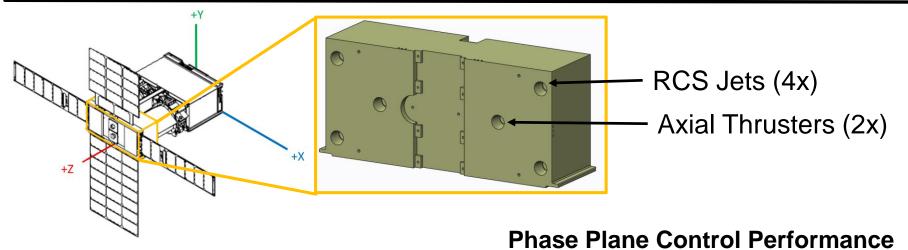

$$f_n = PA\left\{ (1 + \tilde{r}s)\cos^2\alpha + B_f(1 - s)\tilde{r}\cos\alpha + (1 - \tilde{r})\frac{\varepsilon_f B_f - \varepsilon_b B_b}{\varepsilon_f + \varepsilon_b}\cos\alpha \right\}$$
$$f_t = PA(1 - \tilde{r}s)\cos\alpha\sin\alpha t$$
