Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. Insecta Mundi publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

Insecta Mundi is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology.

Abstract. In recent years, populations of the Asian citrus psyllid, *Diaphorina citri* Kuwayama (Hemiptera: Liviidae), have increased in rural citrus orchards and urban backyard gardens. In order to find biological control options for *D. citri*, a search for natural enemies was conducted in the department of Valle del Cauca, Colombia. The collections were carried out in citrus orchards in rural areas and house gardens and street trees in urban areas. Natural enemies were collected from *D. citri* found on *Citrus* spp. and *Murraya paniculata* (L.) Jack (Rutaceae). A total of 16 species of natural enemies of *D. citri* distributed in six families in five orders are reported from Colombia. Herein we provide an updated list of 95 species of arthropod (arachnids and insects) natural enemies of *D. citri* distributed in nine orders and 23 families recorded worldwide.

Key words. Arthropods, Asian citrus psyllid, biological control, insects, mites, parasitoids, predators, spiders.

Resumen. En los últimos años, las poblaciones del psílido asiático de los cítricos, *Diaphorina citri* Kuwayama (Hemiptera: Liviidae), han aumentado en huertos cítricos en zonas rurales y jardines de traspatio en zonas urbanas. Con el fin de encontrar opciones de control biológico de *D. citri*, se realizó una búsqueda de enemigos naturales en el departamento de Valle del Cauca, Colombia. Las recolectas se llevaron a cabo en huertos de cítricos en zonas rurales y jardines de casas y árboles en zonas urbanas. Los enemigos naturales de *D. citri* se recolectaron sobre *Citrus* spp. y *Murraya paniculata* (L.) Jack (Rutaceae). Un total de 16 especies de enemigos naturales de *D. citri* distribuidos en seis familias en cinco órdenes se reportan para Colombia. Proveemos un listado actualizado de 95 artrópodos (arácnidos e insectos) enemigos naturales de *D. citri* distribuidos en nueve órdenes y 23 familias registrados en el mundo.

Palabras clave. Ácaros, arañas, artrópodos, control biológico, Psílido asiático de los cítricos, insectos, parasitoides, depredadores.

Introduction

The citrus industry in Colombia plays a major role in the country's agricultural economic sector and is a valuable source of employment; with 62,409 hectares of planted area and an average yield of 10.9 t/ha (DANE 2010). In particular, the department of Valle del Cauca has one of the highest citrus productions in Colombia, with 22.6% (MADR 2010). The citrus industry, like other agricultural activities are affected by the proliferation of insect pests and diseases that limit their yield. One of the most important problems to the citrus industry at the global level is the plant disease known as citrus greening or Huanglongbing (HLB) (Halbert and Manjunath 2004). In the New World, this disease is caused by the bacteria *Candidatus Liberibacter asiaticus* and *Candidatus Liberibacter americanus* that block the plant vascular bundles leading to the dieback of the plant (Laflèche and Bové 1970). Huanglongbing is probably the most serious disease of citrus, even more serious than Citrus tristeza virus, representing a dangerous threat for regions still free of the disease (Bové 2006). The main vector of the bacterium that causes HLB is called *Diaphorina citri* Kuwayama, 1908 (Hemiptera: Liviidae) (Mead and Fasulo 2011). *Diaphorina citri* has a broad distribution and an extensive list of host plants in about 25 genera of Rutaceae (Halbert and Manjunath 2004). Currently, Huanglongbing has not been diagnosed in Colombia (Ángel et al. 2014), but the insect vector, *D. citri* has been reported since 2007 (ICA, 2010) as well as its parasitoid *Tamarixia radiata* (Waterston, 1922) (Hymenoptera: Eulophidae) (Ebratt et al. 2011a; Kondo et al. 2012). Recently, a new species of *Candidatus Liberibacter* bacteria *C. L. caribbeanus* was reported from Colombia (Manjunath et al. 2015); however, its association with HLB is unknown.

Vector control is a critical factor in the prevention, containment and management of HLB (Kondo et al. 2012). Despite the importance of *D. citri* as a vector of HLB, very few studies on natural enemies of this psyllid have been carried out in Colombia, with the exception of those that report the presence of the ectoparasitoid *T. radiata* which is considered a potential effective parasitoid in Colombia in various regions of mainland Colombia (Ebratt et al. 2011a; Kondo et al. 2012), and a recent report of the dragonfly *Erpetogomphus sabaeleticus* Williamson (Odonata: Anisoptera: Gomphidae) feeding on an adult of *D. citri* (Kondo et al. 2015). Kondo et al. (2015) presented a list of more than 63 arthropod (insects and spiders) species distributed in seven orders and 17 families as natural enemies of *D. citri* in the world. In anticipating the arrival of HLB, identifying natural enemies of the insect vector could help minimize the environmental impact that could cause the heavy use of synthetic chemical insecticides to control this insect vector.

The objective of this study is to report natural enemies of *D. citri* of the Class Insecta collected in the department of Valle del Cauca, Colombia and to provide an updated checklist of arthropod natural enemies (insects, mites and spiders) worldwide.

Materials and Methods

In order to find biological control options for the Asian citrus psyllid, *D. citri*, a search was made for natural enemies of nymphs and adult psyllids in the department of Valle del Cauca, Colombia. Field collections were made in garden plants, trees in urban areas and farms planted with *Citrus* spp. and *Murraya paniculata* (L.) Jack (Rutaceae).

Natural enemies were collected using small brushes and put into 70% alcohol. For the identification of coccinellids (Coleoptera), extraction of genitalia and species identifications were carried out by the second author (G. González). The genitalia of the coccinellids were extracted by macerating the abdomens in 10% KOH solution inside a glass tube submerged in hot water for 20–30 minutes, and later washed with distilled water. Components of the genitalia were separated under the microscope using insect pins and slide-mounted in glycerin on glass slides in order to study the important morphological features. For subsequent storage, the genitalia were put into micro vials filled with glycerin and attached to the insect pin of the specimen from which they were extracted. Both male and female specimens were dissected. The wasp (Hymenoptera) was identified using the keys by Fernandez and Sharkey (2006). The chrysopids (Neuroptera) were collected in the larval stage while feeding on nymphs of *D. citri*; these were fed sufficient *D. citri* nymphs and raised to the adult stage in the laboratory in order to enable

their identification. For the chrysopids, species identification by examination of genitalia was carried out by the third author (C. Tauber). The abdomens of representative male and female specimens from each species were snipped from the specimens with surgical scissors. Soft tissue in the abdomens was cleared in 10% KOH solution inside a Stender dish submerged in hot water for several hours. Subsequently, the male genitalia were everted with a fine syringe, whereas the female genitalia were left in place in the abdomen; then the abdomens were rinsed with distilled water and transferred to glycerine containing Chlorazol Black stain. The abdomens remained in the stain for varying times depending on the degree of sclerotization of the specimen. Stained abdomens were examined in glycerine on slides and stored in microvials containing glycerin and attached to the insect pin of the specimen from which they were removed. The chrysopids were identified primarily with keys by Adams and Penny (1985) and Freitas et al. (2009). The syrphid species (Diptera) were originally identified by the fourth author (Y.C. Guzman) using the illustrated key to genera of Syrphidae of Marinoni et al. (2007). Then the fifth author (A.F. Vinasco) further identified the specimens based on external morphological characters, e.g., coloration patterns of the abdomen and chaetotaxy of the thorax using the keys by Thompson (2006). The assassin bug (Hemiptera: Reduviidae) was identified by the sixth author (D. Forero) based on coloration and other external features using the taxonomic treatment of Hart (1972).

Herein we have updated the list by Kondo et al. (2015) based on newly collected natural enemies of *D. citri*. Many hymenopterous parasitoids have been reported associated with *D. citri*, however, herein we list only primary parasitoids and excluded hyperparasitoids from the list, e.g., *Marietta leopardina* Motschulsky, 1863, reported from Iran by Rakhshani and Saeedifar (2013). Likewise, there are many ant species that have been listed as predators of *D. citri* (e.g., Michaud 2004), however, many of those species were only observed nearby the psyllids or tending them (i.e., feeding on the honeydew). Thus, only those species that show some evidence of predation, i.e., carrying away *D. citri* nymphs, or feeding directly on the psyllid should be considered as natural enemies. Of the eight ant species listed by Michaud (2004) only two showed some evidence of predation, i.e., carrying away *D. citri* nymphs (Kondo et al. 2015).

Depositories. Specimens are deposited at the insect collections of Guillermo González, Santiago, Chile (CPGG); Bohart Museum of Entomology, University of California, Davis, California, USA (BME); and Museo de Entomología, Corporación Colombiana de Investigación Agropecuaria, Centro de Investigación Palmira, Palmira, Valle del Cauca, Colombia (MECP).

Results

A total of 16 species of natural enemies distributed in six families in five orders was identified preying upon *D. citri* in Colombia, i.e., nine ladybeetles: *Azya orbignera* Mulsant, 1850 (Fig. 1A), *Cheiromenes sexmaculata* (Fabricius, 1781) (Fig. 1B), *Chilocorus* cf. *cacti* (L., 1767) (Fig. 1C), *Curinus colombianus* Chapin, 1965 (Fig. 1D), *Cycloneda sanguinea* (L., 1763) (Fig. 1E), *Harmonia axyridis* (Pallas, 1773) (Fig. 1F), *Hippodamia convergens* Guérin-Méneville, 1842 (Fig. 1G), *Olla v-nigrum* (Mulsant, 1866) (Fig. 1H), *Scymnus rubicundus* Erichson, 1847 (Fig. 1I) (Coleoptera: Coccinellidae); two species of hover flies: *Allograpta (Fazia) CR-2 aff. hians* (Enderlein, 1938) (Fig. 1J), *Leucopodella* sp. (Fig. 1K), (Diptera: Syrphidae); the predatory bug *Zelus cf. nugax* Stål, 1862 (Fig. 1L), (Hemiptera: Reduviidae); the paper wasp *Polybia* sp. (Fig. 1M), (Hymenoptera: Vespidae); the ectoparasitoid *T. radiata* (Fig. 1N), (Hymenoptera: Eulophidae); two species of lacewings: *Ceraeochrysa* sp. (Fig. 1O) and *Ceraeochrysa* cf. *clavari* (Navás, 1911) (not illustrated) (Neuroptera: Chrysopidae).

As a result, together with literature records, the total number of arthropod natural enemies of *D. citri* is increased to 95 species distributed in nine orders and 23 families worldwide (Table 1). Most recorded natural enemies of *D. citri* are the ladybeetles (Coleoptera: Coccinellidae) with 38 species (40%), followed by lacewings (Neuroptera: Chrysopidae) with 13 species (14%) and the hoverflies with eight species (10%). In Colombia, the number of natural enemies of *D. citri* is increased to 17 species distributed in seven families in six orders, all in the class Insecta (Table 1).

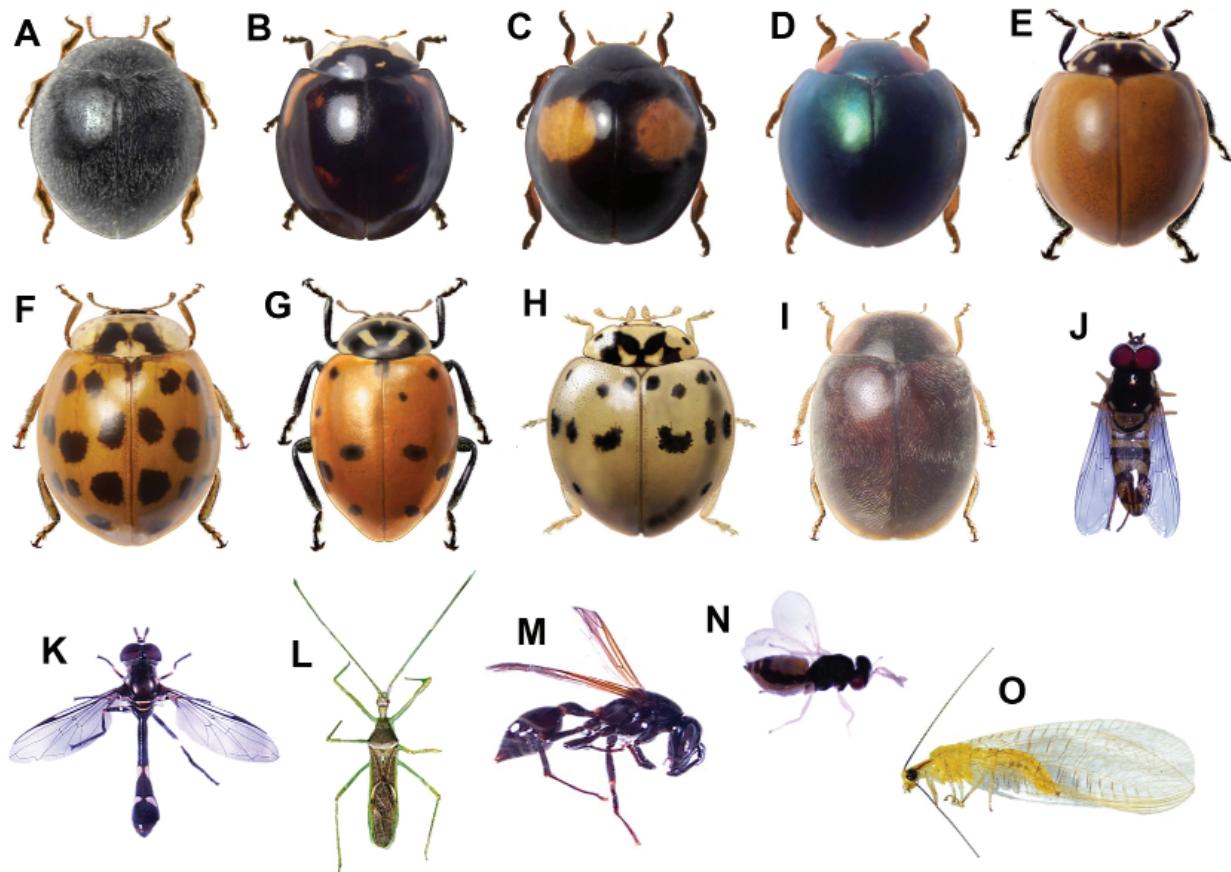

Figure 1. Natural enemies associated with *Diaphorina citri* in Colombia. **Coleoptera: Coccinellidae:** A. *Azia orbignera* Mulsant, B. *Cheilomenes sexmaculata* (Fabricius), C. *Chilocorus cacti* (L.), D. *Curinus colombianus* Chapin, E. *Cycloneda sanguinea* (L.), F. *Harmonia axyridis* (Pallas), G. *Hippodamia convergens* (Guerin-Meneville), H. *Olla v-nigrum* (Mulsant), I. *Scymnus rubicundus* Erichson. **Diptera: Syrphidae:** J. *Allograpta* (Fazia) CR-2 aff. *hians*, K. *Leucopodella* sp. **Hemiptera: Reduviidae:** L. *Zelus* cf. *nugax* Stål, **Hymenoptera: Vespiidae:** M. *Polistes* sp. **Eulophidae:** N. *Tamarixia radiata* (Waterston). **Neuroptera: Chrysopidae:** O. *Ceraeochrysa* sp.

Discussion

A general characteristic of arthropods reported as natural enemies of *D. citri* is that all recorded species are generalist predators, with the exception of the parasitoids *T. radiata* and *Diphoreencyrtus aligarhensis* Shafee, Alam and Agarwal, 1975 (Hymenoptera: Encyrtidae) (Kondo et al. 2015). Hussain and Nath (1927) reported nine species of parasitoids attacking nymphs of *D. citri* in Punjab province, Pakistan, but, according to Hoddle et al. (2014) most of those species are hyperparasitoids or parasitoids of other species of insects and that there are just two species of primary parasitoids of *D. citri* in Punjab Province, namely, *T. radiata* and *D. aligarhensis*.

Many species of ants have been listed as predators of *D. citri* (e.g., Michaud 2004), although no observations on predation have been observed. According to Way (1963) *apud* Navarrete et al. (2013), ants which tend Hemiptera may feed on their trophobionts when sources of proteins and lipids are scarce. Navarrete et al. (2013) reported that the presence of the ants *Pheidole megacephala* Fabricius, 1793, *Brachymyrmex patagonicus* Mayr, 1868, and *Solenopsis invicta* Buren, 1972, was positively correlated with higher parasitism rates of *T. radiata* in an ant exclusion experiment conducted in Homestead, Florida (USA). In their study, Navarrete et al. (2013) did not see any aggressive behavior of ants against nymphs of *D. citri*, and the number of *D. citri* nymphs did not show a statistical difference between ant tended and not-tended *D. citri* nymphs, suggesting that the ants did not eat the tended psyllids.

The present study focused on arthropod natural enemies of *D. citri*, however, nymphs and adults of *D. citri* were occasionally found infected by entomopathogenic fungi, thus these organisms appear to have some control on *D. citri* populations in natural conditions. Several species of entomopathogenic fungi have been reported to infect *D. citri* worldwide and may be useful as biopesticides, including *Isaria fumosorosea* Wize (= *Paecilomyces fumosoroseus*), *Hirsutella citriformis* Speare, *Lecanicillium* (= *Verticillium*) *lecanii* Zimm., *Beauveria bassiana* (Bals.) Vuill., *Cladosporium* sp. nr. *oxysporum* Berk. and MA Curtis, *Acrostalagmus aphidum* Oudem, *Paecilomyces javanicus* (Friederichs and Bally) AHS Brown and G Smith, and *Capnodium citri* Berk. and Desm. (Hall, 2012).

Due to the limited scope of this study, we expect that many more natural enemies will be discovered in the future in Colombia and elsewhere. During the present study, several species of assassin bugs in the genus *Zelus* were found feeding on adult *D. citri*, suggesting that this group of hemipterous predators may be important natural enemies of *D. citri* in the studied area (T.K., personal observations). Little is known regarding the extent to which these predators reduce infestations of *D. citri*, but some of these are considered important biological control agents (Hall et al. 2012).

Acknowledgments

Many thanks to Dr. Guanyang Zhang (School of Life Sciences, Arizona State University) for kindly corroborating the identification of the reduviid bug. The authors thank Dr. Lucia Claps (INSUE - Universidad Nacional de Tucumán, Argentina) and Dr. Ana Peronti (UNESP/FCAV - Câmpus de Jaboticabal, São Paulo, Brazil) for kindly reviewing the manuscript. Many thanks to the Editor and Reviewers of Insecta Mundi who helped improved the manuscript.

	* <i>Leucopodella</i> sp.	*Colombia
	<i>Ocyptamus</i> sp.	Cuba (González et al. 2001, 2002, Rodríguez-Toledo et al. 2008)
	<i>Ocyptamus fuscipennis</i> (Say, 1823)	USA (Michaud 2004)
	<i>Pseudodororus clavatus</i> (Fabricius, 1794)	USA (Michaud 2002)
HEMIPTERA		
	Anthocoridae	
	<i>Anthocoris</i> sp.	USA (Michaud 2002)
	<i>Orius</i> sp.	USA (Michaud 2002)
	Geocoridae	
	<i>Geocoris</i> sp.	Taiwan (Chien and Chu 1996)
	Reduviidae	
	<i>Zelus longipes</i> (L., 1767)	Mexico (Miranda-Salcedo and López-Arroyo 2010), USA (Hall et al. 2008, Navarrete et al. 2014)
	* <i>Zelus</i> cf. <i>nugax</i> Stål, 1862	*Colombia
	<i>Zelus</i> sp.	USA (Michaud 2002)
HYMENOPTERA		
	Encyrtidae	
	<i>Diphorencyrtus aligarhensis</i> Shafee, Alam and Agarwal, 1975	Argentina (García-Darderes 2009), China (Yang et al. 2006), India, Filipinas (Aubert 1987), Reunion Island (Aubert and Quilici 1984), USA (Hoy and Nguyen 1998, Michaud

		2002), Taiwan (Chien and Chu 1996, Chu and Chien 1991), Vietnam (Aubert 1987)
	Eulophidae	
	* <i>Tamarixia radiata</i> (Waterston, 1922)	Argentina (García-Darderes 2009); *Colombia (Ebratt-Ravelo et al. 2011a, b, Kondo et al. 2012, PS), China (Yang et al. 2006), Cuba (Baños-Díaz et al. 2013, González et al. 2001, 2002, Miranda et al. 2011, Rodríguez-Toledo et al. 2008), Guadeloupe (Étienne et al. 2001), Iran (Rakhshani and Saeedifar 2013), USA (Hoy and Nguyen 1998; Michaud 2002, 2004), Mexico (Miranda-Salcedo and López-Arroyo 2010), Taiwan (Chien and Chu 1996; Chu and Chien 1991)
	Formicidae	
	<i>Dorymyrmex bureni</i> (Trager, 1988)	USA (Michaud 2004)
	<i>Pseudomyrmex gracilis</i> (Fabricius, 1804)	USA (Michaud 2004)
	Vespidae	
	<i>Brachygastra mellifica</i> (Say 1837)	Mexico (Reyes-Rosas et al. 2014)
	* <i>Polybia</i> sp.	*Colombia
MANTODEA		
	Family undetermined	
	Species undetermined	China (Yang et al. 2006)
NEUROPTERA		
	Chrysopidae	
	<i>Ceraeochrysa claveri</i> (Navás, 1911)	Mexico (Lozano-Contreras et al. 2012)
	* <i>Ceraeochrysa</i> cf. <i>claveri</i> (Navás, 1991)	*Colombia
	<i>Ceraeochrysa cubana</i> (Hagen, 1861)	Mexico (Lozano-Contreras et al. 2012)
	<i>Ceraeochrysa everes</i> (Banks, 1920)	Mexico (Lozano-Contreras et al. 2012)
	<i>Ceraeochrysa</i> sp. nr. <i>cincta</i> (Schneider, 1851)	Mexico (Lozano-Contreras et al. 2012)
	<i>Ceraeochrysa valida</i> (Banks, 1895)	Mexico (Lozano-Contreras et al. 2012)
	* <i>Ceraeochrysa</i> spp.	*Colombia, Mexico (Rodríguez-Palomera et al. 2012), USA (Michaud 2002, 2004),
	<i>Chrysopa septempunctata</i> Wesmael, 1841	China (Yang et al. 2006)
	<i>Chrysopa</i> spp.	Cuba (González et al. 2001, 2002, Rodríguez-Toledo et al. 2008), Mexico (Lozano-Contreras et al. 2012), USA (Hall et al. 2008)
	<i>Chrysoperla carnea</i> (Stephens, 1836)	Iran (Rakhshani and Saeedifar 2013)

	<i>Chrysoperla rufilabris</i> (Burmeister, 1839)	USA (Michaud 2002, 2004), Mexico (Lozano-Contreras et al. 2012; Miranda-Salcedo and López-Arroyo 2010)
	<i>Chrysoperla</i> spp.	USA (Michaud 2004), Mexico (Lozano-Contreras et al. 2012)
	<i>Mallada boninensis</i> (Okamoto, 1914)	China (Lin et al. 1973, Yang et al. 2006), Taiwan (Chien and Chu 1996)
	Hemerobiidae	
	<i>Micromus posticus</i> (Walker, 1853)	USA (Michaud 2002)
ODONATA		
	Gomphidae	
	<i>Erpetogomphus sabaleticus</i> Williamson, 1918	Colombia (Kondo et al. 2015)
