Robert W. Mayer
Utilization Supervisor
Division of Forestry
Indiana Department of Natural Resources

INTRODUCTION

The Department of Forestry and Natural Resources, Purdue University in cooperation with the Indiana Agricultural Statistics Service has conducted a formal survey of Indiana sawmills and veneer mills since at least 1957. The primary data collected is the price paid for logs delivered to the mills. From 1957 to 1976 the results were published as an Extension Circular. From 1977 to 1989 the results were published in the Indiana Forest Products Marketing and Wood Utilization Report. This is the second year that the results have been published as a Purdue Agricultural Experiment Station Bulletin.

METHODOLOGY

The questionnaire was mailed in early May to the 240 mills listed in the data base as buying logs. A follow-up questionnaire was mailed out six weeks later. During the first week of July selected mills were contacted by phone in an attempt to increase the response. No attempt was made to sample non-respondents. Therefore, it must be assumed that the response is biased. The standard errors should be used for year-to-year comparisons only.

The data base used for the survey is the comprehensive mill listing being jointly maintained by Purdue's Department of Forestry and Natural Resources (William L. Hoover) and the Indiana Division of Forestry (Robert W. Mayer). A major revision is currently underway in conjunction with the timber drain study being conducted by the Indiana Division of Forestry in cooperation with the Forest Survey Unit, U.S. Forest Service, St. Paul, MN. It is hoped that by maintaining a common data base accuracy can be increased and the total work load reduced.

A total of 67 mills returned the questionnaire. Thirteen of those returned contained no data. Thus, the overall response rate was 28 percent (67/240). The largest number of responses (23) was obtained from mills sawing primarily grade lumber, Table 1. Compared to the 1990 survey the number of mills reporting sawlog prices for the major species increased from about 20 to about 30, depending on the species. Thus, it can be assumed that the mean sawlogs prices reported in Table 2 reflect actual market conditions.

Much less confidence should be given to the average veneer log prices reported in Table 4. The veneer industry in Indiana continues to change. The major change is the conversion of several of the traditional mills to custom slicing only. Four of the 17 face mills slice logs on a contract basis for veneer marketing firms. Thus, the total number of mills that could be expected to provide data has declined. Since only delivered mill prices are reported, prices paid for veneer logs bought for the log export market are not reflected in the survey results.

Table 1. Mills by type included in data base and response to 1991 price survey by type of mill.

| | Mills Responding | | |
|----------------------|------------------|-----------------------------|--------------------------------|
| | Total | Questionnaires With Data | Questionnaires Without Data |
| Sawmills (SIC 2421) | 281 | 46 | 13 |
| Custom | 48 ¹ | 3 | 2 ² |
| Grade | 98 | 23 | 5 |
| Pallet | 46 | 8 | 1 |
| Other | 89 | 12 | 5 |
| Veneer (SIC 2435) | 19 | 7 | 0 |
| Custom slice | 4 | 1 | 0 |
| Rotary | 2 | 0 | 0 |
| Slice | 13 | 6 | 0 |
| Cooperage (SIC 2429) | 3 | 1 | 0 |
| Piling (SIC 2499) | 1 | 0 | 0 |
| Paper (SIC 2631) | 1 | 0 | 0 |
| Total | 305 | 54 | 13 |

¹ Most custom mills didn't receive the questionnaire since they are listed as not buying logs in data base.

² Mills out of business.

The responses were analyzed using a PC-based SPSS package. The responses were screened for obvious errors. In addition, any response that was obviously out of range was discarded. For example, if the responses for a category included one or more mills reporting prices of \$40, \$50, \$60, \$70, \$80, and one mill reporting \$240, the \$240 response was discarded.

The median price is the reported price that divides the histogram of the distribution of prices into two equal halves. The median and mean would have the same value if the distribution was an exact bell-shaped normal curve. The standard error of the mean (s.e.) is a measure of the variability of the responses. It indicates the amount by which the mean would vary if a different set of mills had responded to the survey. Note that the standard error is relatively small for those species/grade categories for which ten or more mills responded, but is high for categories for which only a few mills responded.

SAWLOG PRICES

The mean and median prices paid for sawlogs are reported in Table 2. Delivered logs prices declined from May 1990 to May 1991. The declines were substantially greater than those for the 1989 to 1990 period. The biggest percentage declines occurred for the premium species sold primarily for domestic furniture and millwork production, and for export. This species include ash, cherry, and all the oaks. Price increases occurred for a few of the species not traditionally sold for furniture production, including basswood, cottonwood, and soft maple. Soft maple was surprisingly strong.

The changes in log prices were consistent with activity in lumber prices, Table 3. Ash prices, Figure 1, peaked in 1989 and appear to be leveling off this summer. Black cherry prices continued to strengthen over the summer for FAS with the straight load premium¹ added, Figure 2. The lower grades are still in surplus. The price for the best grade of red oak, FAS, started a 14 year climb in 1973, Figure 3. Prices for the common grades have been less cyclical since 1988. FAS prices were in a free-fall from the spring of 1990 until June of this year. White oak prices, Figure 4, remained flat over the last 18 months, except for No. 2A.

Lumber prices have been steady over the last year for most of the other species: hard maple, Figure 5, soft maple, Figure 6, sycamore, Figure 7, and cottonwood, Figure 8. Rising soft maple log prices in the face of steady lumber prices indicate that Indiana mills are picking up a greater portion of the national soft maple market. Yellow poplar (tulipwood) lumber prices, Figure 9, have leveled off this summer after falling since the spring of 1990. This market should strengthen as housing starts and rehabilitations increase, increasing the demand for millwork.

1. The prices quoted in the Hardwood Market Report are for loads of lumber of mixed grades, usually as the lumber comes from the mill. Buyers who want loads of only the top grade, FAS, pay a premium over the mixed grade price. This compensates the seller for having to market straight loads of lower grade lumber.

Table 2. Prices paid for delivered sawlogs by Indiana sawmills, May 1991 and May 1990.

veneER LOG PRICES

Because veneer log prices were solicited only from veneer mills and their response was low, the veneer log prices must be interpreted carefully. The price reported for any species, grade, and size category with less than five responses is essentially meaningless. Therefore, this year's results are meaningful only for the prime grade of the smaller log sizes of walnut and the oaks. Comparison of 1991 prices with 1990 prices are also of limited value where the 1990 sample was less than five.

The reported black walnut veneer log prices, Table 4, were down for the larger high quality logs. Prices were much stronger for the smaller lower grade logs. The demand for walnut veneer remains strong within its market niche, but the furniture makers are having to make-do with the affordable quality available from the smaller lower grade logs. Increased efficiency in edge gluing of veneer is critical in keeping the product affordable.

White oak prices were off across-the-board. Veneer quality white oak logs still sell at a substantial premium to white oak sawlogs. The "glory days" of white oak appear to be over, however. Red oak veneer log prices fell by more than 25 percent for the prime grade. There appears to be very little, if, any difference between the price of lower grade red oak veneer log and the best sawlog grade.

Veneer Log Grades

The standards for defining the "prime" and "select" veneer log grades are determined by each mill responding to the survey. This has been the practice since the survey was started in 1954. It is consistent with the industry practice of not adopting a common veneer log grading system. Each veneer mill has developed a proprietary grading scheme to meets its unique needs.

The prime grade should be interpreted to represent a log containing no noticeable defects such as knots, adventitious buds, splits, end checks, crook, and sweep. This grade does not take into account the many subtle factors that can significantly increase the value of a veneer log, such as geographical source of the tree, soil in which the tree was grown, growth rate, bark texture, among others.

The select grade should be interpreted as a log better than a prime grade sawlogs, but containing at least one significant defect.

CUSTOM COSTS AND MISCELLANEOUS PRODUCTS

Costs reported for custom activities, Table 5, continue to be highly variable, but within the same range as last year. Logging costs appear to have declined, but since only three mills reported this cost in 1990, there is little basis for comparison. The average hauling cost is just over \$1.00 per MBF per mile. This cost hasn't changed substantially since the last oil "crisis."

The price paid for pallet lumber logs, Table 6, was essentially unchanged. An expected continuation of the current strong market for railroad ties should hold up the price for lower quality timber. Bark prices remain strong for mills located within a reasonable haul distance of urban landscape markets, or a wood-residue fired boiler.

Handle logs, Table 7, were down about the same amount as sawlogs. The slight premium over sawlog prices remains, however. There is a slight premium for hard maple handle logs, but none for hickory.

INDIANA TIMBER PRICE INDEX -- UPDATE

The delivered log prices collected in the Indiana Forest Products Price Survey are used to calculate the delivered log value of typical stands of timber. This provides trend-line data that can be used to monitor long-term price trends for timber. The species and log quality distribution used to calculate the weighted averages were reported in Indiana Forest Products Marketing and Wood Utilization Report, Bulletin No. 189, June 16, 1987, p. 13.

The actual price, Table 8, is a weighted average of the delivered log prices reported in the price survey. The price index is the series of actual prices divided by the price in 1957, the base year. The real price is the actual price deflated by the producer price index for all commodities with 1982 as the base year. Thus, the real price series represents the purchasing power of dollars based on a 1982 market basket of industrial goods.

Average Stand

The value of the logs in an average stand of timber declined from \$291 per MBF in 1990 to \$270 per MBF in 1991, a 7.2 percent drop. After adjusting for inflation the decline over the last year was 7.8 percent. If the change in real prices from 1957 to 1991 had been constant from year to year, that is, a straight line, the yearly change would have averaged 0.9 percent. This trend is unchanged from last year, but the index was below the trend line in 1991 for the first time since 1986, Figure 10.

Quality Stand

The value of the logs in a high quality stand of timber decreased from \$420 per MBF in 1990 to \$381 per MBF in 1991, a 9.1 percent decline. After adjusting for inflation the decrease was from \$361 per MBF to \$326 per MBF, a 9.7 percent decline. If the change in real prices from 1957 to 1990 had been constant from year to year, that is, a straight line, the yearly change would have averaged 1.4 percent. This is the same trend as last year, but the index also fell below the trend line in 1991, Figure 11.

IMPLICATIONS

Like any other manufacturing industry, Indiana's lumber and wood products industry is constantly changing. Over the last several years sawmills have been caught in a classical cost squeeze. What mills get for their product, lumber prices, have declined more than the cost of their primary input, sawlogs. This drives marginal producers out of business. Nevertheless, total lumber output continues to increase as mills that want to stay competitive increase efficiency with improved conversion technology and the use of Statistical Process Control (SPC) technology in monitoring sawing performance. An increasing number of mills are also capturing additional value by drying and in some cases surfacing their product.

The number of mills in Indiana has declined over the last year. The estimated number of sawmills for the 1962 to 1988 period is shown in Figure 12. The factors determining the number of mills at which the industry stabilizes in the long-run will be timber availability of course, and the cost of hauling logs. The high cost of procuring and hauling hardwood logs generally limits the capacity of mills to the volume of timber available within a 100 mile haul.

The expansion of lumber production by Indiana's industry is based primarily on the increased inventory of timber. At this time it's unclear whether or not the resource base can support the current level of production. The long-term upward trend in timber prices is a clear indication that the harvest is increasing faster than increase in inventory. The drain study now under way will help to clarify this issue.

Advise to Timber Sellers

The natural tendency during a period of falling timber prices is for landowners to stay out of the market. At this point in the cycle, however, timber owners should note that the price of lumber of the premium species has stabilized and that the price of the other species has been stable for over a year. Thus, as mills build up log supplies for the winter, buyers will be looking at stable lumber prices. Owners of lower quality stands of timber should be especially willing to offer their product for sale.

The economic numbers coming out of Washington make the vigor of the ongoing recovery unclear. The big unknown appears to be the extent to which additional restructuring of the major manufacturing industries is necessary. The computer industry is currently in the news. Additional cuts by the U.S.-based auto industry may also be necessary. These adjustments are expected to dampen the rate of recovery, not turn the economy back down. As a result, there appears to be little reason to expect significant upward pressure on hardwood lumber prices. Timber owners with high quality stands will find receptive buyers with a favorable outlook on product prices.
