

8th International Conference on Physical and Numerical Simulation of Materials Processing (ICPNS)

14–17 October 2016

Seattle, Washington | Hosted by Purdue University

### SESSION 3: DEFORMING AND RECRYSTALLIZATION, SALON C

Co-Chairs: Lin Hua, Wuhan University of Technology; Kexing Song, Henan University of Science and Technology; Mei Zhang, Shanghai University; Baohui Tian, Bohler Special Steel

SATURDAY, OCTOBER 15, 2016

## Hot deformation behavior and Hansel–Spittel constitutive model of Cr5 alloy for heavy backup roll

Xuewen Chen, Henan University of Science and Technology; Xiang Ma, SINTEF Materials and Chemistry; Huijun Zhou, Henan University of Science and Technology

### ABSTRACT

The heavy backup roll is a key component in large steel rolling production line, as it supports the work roll to prevent any excessive deflection. The backup rolls are traditionally produced by large-scale forging process. To accurately describe the high-temperature flow behavior of a newly developed roll material Cr5 alloy for numerical forging simulation, a thermal simulation testing machine, Gleeble-1500D, is used in this work. The isothermal compression experiments are carried out to study the flow behavior of Cr5 alloy at temperature range of 900–1200°C, and strain rate range of 0.005–5 s<sup>-1</sup>. Hansel–Spittel model is thus used to establish the constitutive equation of the material under hot deformation. The accuracy of the constitutive equation is analyzed by using correlation coefficient  $r$ . The validation shows that this equation can accurately predict the thermal deformation behavior Cr5 alloy.

**KEYWORDS:** Cr5 alloy steel, hot deformation, Hansel–Spittel model, dynamic recrystallization
