Thesis summary

Background

The premarket assessment of medical devices by an independent regulator is necessary to ensure that devices are safe and effective before they are made available to consumers in Australia. This responsibility is further necessitated by the practice of direct-toconsumer advertising (DtCA), whereby devices can be promoted to, and accessed by consumers without the involvement of a registered healthcare practitioner. An increase in the number of complaints against medical device advertising in Australia has raised questions around the effectiveness of the current regulations at ensuring that devices and their advertising material are adequately supported by evidence.

Aims

The aim of this thesis is to explore the relationship between scientific evidence and DtCA in the policy context of medical device regulation in Australia. This aim is investigated using a case study of three emerging breast cancer imaging devices: digital infrared thermal imaging (DITI), electronic impedance scanning (EIS) and electronic palpation imaging (EPI). In this thesis, the evidence supporting the safety and effectiveness of these devices is evaluated, the nature and frequency of claims presented in online advertisements for these devices are assessed and compared against the available evidence, and stakeholders are engaged in a discussion around options to reform the regulation of medical devices and medical device advertising.

Methods

A mixed methods approach was undertaken, involving three interrelated studies. The first study presents a systematic review of the available evidence for the safety and effectiveness of DITI, EIS and EPI. Following the systematic review, a quantitative content analysis was used to investigate the evidentiary basis of advertising claims made on websites that promote DITI, EIS and EPI in Australia. Finally, the results of the first two studies were used to inform stakeholder engagement around options to reform the regulation of medical devices and medical device advertising. Thematic analysis was used to synthesise stakeholder preferences in relation to a series of reform options proposed by Australia's principal therapeutic goods regulator, the Therapeutic Goods Administration (TGA).

Results

Study 1

As no direct effectiveness data were identified, the surrogate outcome measure of diagnostic accuracy became the primary focus of the systematic review. Significant heterogeneity was present among all three device classes, limiting the potential for meta-analyses. There was insufficient evidence to support the use of DITI, EIS or EPI for breast cancer screening, and the reported estimates of the sensitivity and specificity in symptomatic populations varied greatly for DITI (Sens 0.25-0.97, Spec 0.12-0.85) and EIS (Sens 0.26-0.98, Spec 0.08-0.81), while only two poor quality studies were identified for EPI.

Study 2

Thirty-nine Australian websites promoting DITI, EIS or EPI were identified. Despite a lack of primary evidence identified in the prior systematic review, the devices were advertised for diagnosis (n = 22 websites), screening (n = 20), prevention (n = 13) and risk factor identification for breast cancer (n = 13). Similarly, advertising claims of diagnostic accuracy (Sens 0.78-0.99, Spec 0.44-0.91) did not reflect the evidence base. Direct comparisons with conventional imaging were highly prominent (n = 31), and one third of websites explicitly promoted their device as a suitable alternative to conventional imaging (n = 12).

Study 3

Sixteen stakeholders representing breast cancer research, patient advocacy and screening provided input into reforms to premarket medical device regulation and advertising proposed by the TGA. Participants highlighted important benefits and limitations of the proposed options. Differences between the TGA's options for reform and stakeholder views indicated a need to update the current model for regulation that allows consumer choice and supports innovation, but within a more tightly regulated, safety-oriented framework.

Conclusion

Online advertising claims made for DITI, EIS and EPI extend the indications and efficacy of these devices beyond the available research evidence. This disconnect suggests the regulatory framework tasked with ensuring the safety and efficacy of these devices and their promotion is in need of reform. Extending the current regulations for advertising preapproval to include medical devices, assessing diagnostic imaging devices for efficacy prior to market, and monitoring the use of a device in practice compared to its approved use on the Australian Register of Therapeutic Goods (ARTG) will help close the gap between DtCA and the evidence for emerging breast imaging devices.

Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

Acknowledgements

A number of people helped guide me through this PhD candidature, offering motivation, guidance, support, and time. To these people I am sincerely grateful, and would like to offer thanks.

First and foremost, my supervisors: Janet Hiller, for generously offering her time, intellect and genuine passion for public health, proving in the process that there are in fact more than 24 hours in a day. Cameron Willis, for providing a truly endless source of motivation and support, and offering guidance and input into every aspect of my role of as a PhD candidate. Caroline Laurence, who joined the panel partway through my candidature, and lent her level-headed pragmatism to anchor the content analysis and stakeholder engagement studies. Linda Mundy, for contributing her vast knowledge of systematic review methodology, and for playing the role of informal editor with so much enthusiasm that I still have nightmares about incorrectly using the letter 'z'.

Tracy Merlin, Jacqueline Street, Liz Buckley, Dagmara Riitano, David Johnson, Danika Hall, Shona Crabb, and Tom Sullivan, for assisting on various projects presented in this thesis, with only free beer, lunch or reciprocity as an incentive.

Adam Elshaug, for providing valuable input into the direction of this thesis during the early stages of conception.

I highly recommend that every commencing PhD candidate find a resident philosopher, like Drew Carter, to bounce ideas off and help guide them through inevitable crises.

Alun Cameron and Wendy Babidge from ASERNIP-s, for understanding the pressures associated with completing a PhD thesis, and for allowing me to work at a reduced capacity while finishing the write up.

My fellow inmates: Tori, Phi, David, Vicki, Icha, Kerri, and Andrew, for helping discuss and empathise with the big and small issues of life as a postgraduate student.

My friends and family, who remained genuinely interested in my thesis topic at every barbeque over the course of my candidature.

And my loving partner, Sharon, who survived 18 months at long-distance, and an equal amount of time dealing with the phrase "not-this-weekend-I'm-still-working-on-my-thesis".
