Abstract

This thesis studies the $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $\tilde{\ell}^\pm \tilde{\ell}^\mp$ production processes in an upgraded LHC environment at $\sqrt{\hat{s}} = 14$ TeV. The Super Razor variables will be employed to obtain kinematic information and separate these Supersymmetric production processes from Standard Model background with identical final state topology. The analysis will be done using Monte Carlo generated data of events where truth-level information will be smeared to simulate the Phase-I and Phase-II ATLAS detector.

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Contents

1	Introduction	1
2	Standard Model and Supersymmetry	3
2.1	Standard Model	3
2.1.1	Feynman Diagrams	4
2.1.2	The Hierarchy Problem	5
2.1.3	Dark Matter	6
2.2	Supersymmetry	7
2.2.1	R-Parity	7
2.3	Production processes	8
2.3.1	Di-leptonic decays	9
2.3.2	SM Background	9
3	Experimental apparatus	13
3.1	The Large Hadron Collider	13
3.2	ATLAS	13
3.2.1	Object Definition	14
3.3	Physics with the upgraded ATLAS detector	15
4	Kinematic Variables	19
4.1	Razor	20
4.2	Super Razor	21
4.2.1	Mass variables	22
4.2.2	Angular variables	24
5	Event Generation, Simulation and Analysis Tools	25
5.1	Monte Carlo Generation and Analysis	25
5.2	MET Smearing	26
5.3	Event reconstruction	27

6	Results and Interpretation	29
6.1	Event Selection	29
6.2	Di-slepton production	29
6.2.1	Analysis for Phase-I: 300fb^{-1} with $\langle \mu \rangle = 60$	29
6.2.2	Analysis for Phase-II: 3000fb^{-1} with $\langle \mu \rangle = 140$	39
6.3	Di-Chargino production	49
6.3.1	Analysis for Phase-I: 300fb^{-1} with $\langle \mu \rangle = 60$	49
6.3.2	Analysis for Phase-II: 3000fb^{-1} with $\langle \mu \rangle = 140$	58
7	Conclusion	69
A	Cross sections and Filter efficiencies	71
