# Mechanically Induced Cis-to-Trans Isomerization of Carbon-Carbon Double Bond Using Atomic Force Microscopy 

## Supplementary Information

by Milad Radiom, Phally Kong, Plinio Maroni, Mark Schäfer, Andreas F.M. Kilbinger and Michal Borkovec

## Materials and Characterization

All commercially available reagents and solvents (Sigma Aldrich, Acros, ABCR and Fluorochem) were used without further purification. $\mathrm{CDCl}_{3}$ was purchased from Cambridge Isotope Laboratories. Reactions were monitored by TLC, Merck silica gel 60F254 plates. Detection was performed by UV light, $\mathrm{KMnO}_{4}$, ninhydrin or $\mathrm{I}_{2}$ staining reagents. Purifications were performed by flash chromatography on silica gel (technical grade, pore size $60 \AA$, 230-400 mesh, 40-63 $\mu \mathrm{m}$ particle size).

Standard nuclear magnetic resonance spectra as well as two-dimensional spectra were recorded at $300 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right.$ NMR) and $75 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right.$ NMR) on a Bruker Avance III 300. All NMR signals were referenced internally to residual solvent signals. Relative molecular weights and molecular weight distributions were measured by gel permeation chromatography (GPC) equipped with a Viscotek GPCmax VE2oor GPC Solvent/Sample Module, Viscotek UV-Detector 2600, Viscotek VE358o RIDetector, and two Viscotek T60oo M columns ( $7.8 \times 300 \mathrm{~mm}, 10^{3}-10^{7} \mathrm{~g} / \mathrm{mol}$ each). All measurements were carried out at room temperature using THF as the eluent with a flow rate of $1 \mathrm{~mL} / \mathrm{min}$. The system was calibrated with polystyrene standards in a range from $10^{3}$ to $3 \times 10^{6} \mathrm{~g} / \mathrm{mol}$. High resolution mass spectrometry (HRMS) was performed by Bruker FTMS 4.7T BioAPEX II ESI-MS.

Synthesis of monomer 1 , tert-butyl (2-((3aR,4R,7S,7aS)-1,3-dioxo-1,3,3a,4,7,7a-hexahydro-2H-4,7-methanoisoindol-2-yl)ethyl)carbamate

5-Norbornene-2,3-dicarboxylic anhydride ( $2.2 \mathrm{~g}, 13 \mathrm{mmol}$ ) was added dropwise to a flask containing vigorously stirred ethylenediamine ( $7.2 \mathrm{~mL}, 107 \mathrm{mmol}$ ) in toluene ( 45 mL ) at room temperature and connected to a Claisen condenser. The reaction temperature was raised to $110^{\circ} \mathrm{C}$ for 8 h . Toluene and ethylenediamine were then removed by distillation. Purification by column chromatography on silica gel DMC/MeOH 9:1 gave exo-N-(2-aminoethyl)-5-norbornene-2,3-dicarboximide as a white solid ( $1.57 \mathrm{~g}, 7.6 \mathrm{mmol}$ ) with $57 \%$ yield. The analytical data of this amine intermediate were in accordance with reported characterization. ${ }^{\underline{1}}$

To a solution of the above amine ( $1.4 \mathrm{~g}, 6.8 \mathrm{mmol}$ ) in DCM ( 45 ml ) di-tert-butyl-dicarbonate ( $2.97 \mathrm{~g}, 13.6 \mathrm{mmol}$ ) and triethylamine ( $0.88 \mathrm{~g}, 1.22 \mathrm{ml}, 8.7 \mathrm{mmol}$ ) were added. The reaction mixture was allowed to stir overnight. The reaction mixture was then washed with $10 \%$ aqueous citric acid solution ( 130 ml ) and the organic layer separated, dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was removed under reduced pressure. This crude product was subject to column chromatography using 9:0.25 DCM:MeOH as eluent. Fractions containing the desired product were combined and the solvent removed under reduced pressure to afford monomer 1 as a white powder ( $0.81 \mathrm{~g}, 3.26 \mathrm{mmol}$ ) with $39 \%$ yield. ${ }^{2,3}$
${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})=6.27\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.72 \mathrm{~Hz}, 2 \mathrm{Ha}\right), 4.77(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NHBOC}), 3.61\left(\mathrm{t},{ }^{3} \mathrm{~J}=5.50 \mathrm{~Hz}, 2 \mathrm{Hd}\right), 3.33(\mathrm{~m}$, 2 He ), $3.26\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.5 \mathrm{~Hz}, 2 \mathrm{Hb}\right), 2.68\left(\mathrm{~d},{ }^{3} \mathrm{~J}=1.19 \mathrm{~Hz}, 2 \mathrm{Hc}\right), 1.50\left(\mathrm{~d},{ }^{3} \mathrm{~J}=9.84 \mathrm{~Hz}, 1 \mathrm{Hf}\right), 1.40(\mathrm{~s}, 9 \mathrm{H}, \mathrm{tBu}), 1.24\left(\mathrm{~d},{ }^{3} \mathrm{~J}=9.84 \mathrm{~Hz}\right.$, 1Hf ${ }^{\prime}$ ).
${ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})=178.31(\mathrm{CO}) ; 160(\mathrm{NHC}=\mathrm{O}) ; 137.95(\mathrm{C}=\mathrm{C}) ; 79.55\left(\mathrm{O}-\mathrm{C}(\mathrm{CH})_{3}\right) ; 48.03(\mathrm{CO}-\mathrm{CH}) ; 45.29$ $(=\mathrm{CH}-\mathrm{CH}) ; 42.98\left(\mathrm{CH}_{2}\right.$-bridge $) ; 39.29\left(\mathrm{CO}-\mathrm{N}-\mathrm{CH}_{2}\right) ; 38.58\left(\mathrm{CH}_{2} \mathrm{NHCO}\right) ; 28.46(\mathrm{tBu})$.

HRMS: mass calculated 329.1471783, mass found 329.1469080.

Synthesis of monomer 2 , ( $3 \mathrm{aR}, 4 \mathrm{R}, 7 \mathrm{~S}, 7 \mathrm{aS}$ )-2-hexyl-3a,4,7,7a-tetrahydro-1H-4,7-methanoisoindole-1,3(2H)-dione

Monomer 2 was synthesized following the general procedure reported for monomer 4 (see below). ${ }^{4}$
${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})=6.25\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.8 \mathrm{oHz}, 2 \mathrm{Ha}\right), 3.41\left(\mathrm{t},{ }^{3} \mathrm{~J}=7.47 \mathrm{~Hz}, 2 \mathrm{He}\right), 3.23$ (quin, $\left.{ }^{3} \mathrm{~J}=1.69 \mathrm{~Hz}, 2 \mathrm{Hb}\right), 2.63$ (d, ${ }^{3} \mathrm{~J}=1.32 \mathrm{~Hz}, 2 \mathrm{Hc}$ ), 1.66 (quin, ${ }^{3} \mathrm{~J}=6.55 \mathrm{~Hz}, 1 \mathrm{Hf}$ ), 1.47 (dquin, ${ }^{3} \mathrm{~J}=9.88,1.57 \mathrm{~Hz}, 1 \mathrm{Hd}$ ), $1.29-1.22$ (m, $6 \mathrm{Hg}, \mathrm{h}, \mathrm{i}$ ), 1.19 (dquin, 9.8o, $1.40,1 \mathrm{Hd}$ "), $0.83\left(\mathrm{t},{ }^{3} \mathrm{~J}=6.68 \mathrm{~Hz}, 3 \mathrm{Hj}\right)$.

HRMS: mass calculated 270.1464500, mass found 270.1465230 .

Synthesis of monomer 4, (3aR,4R,7S,7aS)-2-(2-ethylhexyl)-3a,4,7,7a-tetrahydro-1H-4,7-methanoisoindole-1,3(2H)dione

Endo-carbic anhydride ( $500 \mathrm{~g}, 3.05 \mathrm{~mol}$ ) was heated to $180^{\circ} \mathrm{C}$ for 2 h and recrystallized from acetone several times to obtain the pure exo-carbic anhydride (101,9 g, 20\% yield).

To a round bottom flask connected to a Claisen condenser containing exo-carbic anhydride ( $32.83 \mathrm{~g}, 200 \mathrm{mmol}$ ), toluene ( 200 mL ) was added until complete dissolution of the solid. Then 2-ethylhexylamine ( $26.88 \mathrm{mg}, 208 \mathrm{mmol}$ ) was added and the reaction mixture was heated at $110^{\circ} \mathrm{C}$. After 2 h of stirring at $110^{\circ} \mathrm{C}$ the solution was heated to $150^{\circ} \mathrm{C}$ to remove toluene by distillation. The crude product was then purified by column silica gel chromatography, hexane/EtOAc 9:1 (Rf o.25), to afford the monomer ( $52.77 \mathrm{~g}, 0.192 \mathrm{~mol}$ ) as a yellow oil with $96 \%$ yield. ${ }^{4}$
${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})=6.24\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.81 \mathrm{~Hz}, 2 \mathrm{Ha}\right), 3.32\left(\mathrm{~d},{ }^{3} \mathrm{~J}=7.16 \mathrm{~Hz}, 2 \mathrm{He}\right), 3.23\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.64 \mathrm{~Hz}, 2 \mathrm{Hb}\right), 2.63(\mathrm{~d}$, ${ }^{3} \mathrm{~J}=1.18 \mathrm{~Hz}, 2 \mathrm{Hc}$ ), $1.66\left(\mathrm{sep},{ }^{3} \mathrm{~J}=6.12 \mathrm{~Hz}, 1 \mathrm{Hf}\right.$ ), 1.47 (dquin, ${ }^{3} \mathrm{~J}=9.99,1.47 \mathrm{~Hz}, 1 \mathrm{Hd}$ ), 1.31-1.1 (m, 9Hg,h,i,k,d"), o.89-0. 78 (m, $6 \mathrm{Hj}, \mathrm{l})$.
${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})=178.41(\mathrm{C}=\mathrm{O}) ; 137.87(2 \mathrm{Ca}) ; 47.82(2 \mathrm{Cc}) ; 45.21(2 \mathrm{Cb}) ; 42.83(1 \mathrm{Ce}) ; 42.56(1 \mathrm{Cf}) ; 37.79(\mathrm{Cg})$; $30.56(\mathrm{Ci}) ; 28.45(\mathrm{Cj}) ; 23.96(\mathrm{Cm}) ; 23.02(\mathrm{Ck})$, $14.10(\mathrm{Cl}) ; 10.40(\mathrm{Cn})$.

HRMS: mass calculated 298.1777501, mass found 298.1776420.

## Synthesis of polymers 3 and Pı

Figure S: Polymers $\mathbf{3}$ and $\mathbf{P} \mathbf{1}$ synthesized in this work with $m \cong 11, n \cong 544$.

An ABA triblcok copolymer that contains carbon-carbon double bond in the backbone was synthesized from N-hexylnorbornen-5,6-dicarboxilicimide monomer 2 and N -BOC-ethylenediamine-exo-norbornen-5,6-dicarboxilicimide monomer $\mathbf{1}$ in the following manner: a sealed Schlenk flask containing monomer $\mathbf{1}(32 \mathrm{mg})$ was placed under vacuum and purged with argon three times before degassed dichloromethane ( 2 mL ) was added via a syringe. The polymerization was initiated by quickly adding a solution of the appropriate amount of Grubbs' third generation catalyst in degassed dichloromethane. The reaction mixture was stirred for 45 min at room temperature. After the complete conversion of $\mathbf{1}$, a solution of monomer $2(936 \mathrm{mg})$ in degassed dichloromethane ( 8 mL ) was added quickly via a syringe, and the mixture was stirred until no residual monomer was left (monitored by GPC). Then a solution of monomer $\mathbf{1}(32 \mathrm{mg})$ in degassed dichloromethane ( 2 mL ) was quickly added. After the complete conversion of $\mathbf{1}$ (monitored by GPC) the polymerization was termi-
nated using ethyl vinyl ether. The polymer was then redissolved in dichloromethane and precipitated twice into methanol. The block copolymer was dried under vacuum to give 3 ( 820 mg ) with $82 \%$ yield. ${ }^{\underline{1}}$

To a solution of $3(85 \mathrm{mg})$ in DCM , an aqueous solution of $\mathrm{HCl}(37 \%)$ was added and the reaction mixture was allowed to stir for 12 h . Then the solvent was removed under vacuum and the solid was redissolved in DCM and then precipitated in methanol and dried under vacuum to give $\mathbf{P r}_{1}(68.5 \mathrm{mg})$ with $77 \%$ yield.

Structures of polymers 3 and $\mathbf{P r}$ are shown in Figure S1. The number average molecular weight of block polymer $\mathbf{3}$ is $M_{n}=4300 \mathrm{~g} / \mathrm{mol}$ with dispersity of $Đ=1.2$. For diblock polymer 3, $M_{n}=170000 \mathrm{~g} / \mathrm{mol}$ and $D=1.2$. For triblock polymer 3, $\mathrm{M}_{\mathrm{n}}=145000 \mathrm{~g} / \mathrm{mol}$ and $D=1.6$. For polymer $\mathbf{P}, \mathrm{M}_{\mathrm{n}}=145000 \mathrm{~g} / \mathrm{mol}$ and $D=1.6$. The apparent loss of molecular weight is most likely due to a reduced hydrodynamic radius caused by aggregation (hydrogen bonds) of the BOC-amine terminal blocks.

Figure S2: ${ }^{1} \mathrm{H}$-NMR spectrum ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of the "BOC deprotected" polymer 3.

## Synthesis of polymer 5 with $\mathrm{m}^{\prime} \cong 8, \mathrm{n}^{\prime} \cong 293$

A sealed Schlenk flask containing monomer $\mathbf{1}(25.5 \mathrm{mg})$ was placed under vacuum and purged with argon three times before degassed dichloromethane ( 2 mL ) was added via a syringe. The polymerization was initiated by quickly adding a solution of the appropriate amount of first generation Grubbs catalyst ( 20.5 mg ) in degassed dichloromethane ( 2 mL ). Then the S 4
reaction mixture was stirred for 45 min at room temperature. After the complete conversion of $\mathbf{1}$ (monitored by GPC), a solution of $4(949 \mathrm{mg})$ in degassed dichloromethane ( 8 mL ) was added quickly via a syringe, and the mixture was stirred until no residual monomer was left (determined via GPC). Then a solution of $\mathbf{1}(26 \mathrm{mg})$ in degassed dichloromethane ( 2 mL ) was added quickly. After the complete conversion of $\mathbf{1}$ (monitored by GPC) the polymerization was terminated with ethyl vinyl ether ( 2 mL ) before precipitating 5 in methanol. The polymer was then redissolved in dichloromethane and precipitated in MeOH twice. The block copolymer was dried under vacuum to give 5 ( 0.879 g ) with $88 \%$ yield. The number average molecular weight of block polymer 5 is $M_{n}=3000 \mathrm{~g} / \mathrm{mol}$ with dispersity of $D=1.3$. For diblock polymer 5, $\mathrm{M}_{\mathrm{n}}=73000 \mathrm{~g} / \mathrm{mol}$ and $Đ=1.3$. For triblock polymer 5, $\mathrm{M}_{\mathrm{n}}=85000 \mathrm{~g} / \mathrm{mol}$ and $Đ=1.3 .^{\underline{1}}$

## Synthesis of polymer 6

Polymer 5 ( 358 mg ) was added to the reaction vessel and was evacuated and backfilled with argon gas three times before degassed toluene 10 mL was added. Then the first generation Grubbs catalyst ( $10 \%$ weight) was added to the solution and the reaction vessel was allowed to put in autoclave at $40^{\circ} \mathrm{C}, \mathrm{H}_{2} 40$ bar and for 40 hours. Then the reaction mixture was precipitated into methanol to afford polymer 6. The resulting polymer was then purified by redissolving in DCM and precipitating three times in methanol and dried under vacuum to give polymer $6(271 \mathrm{mg})$ with $75 \%$ yield. For polymer 6, $\mathrm{M}_{\mathrm{n}}=103000 \mathrm{~g} / \mathrm{mol}$ and $Đ=1.3 .^{\underline{1}}$

## Synthesis of $\mathrm{P}_{2}$

The N-BOC deprotection of the triblock copolymer 6 was performed as follows: to a solution of 6 ( 115 mg ) in DCM ( 3 mL ) TFA ( 2 mL ) was added and the reaction mixture was allowed to stir for 12 h at room temperature. Then the solvent was removed under vacuum and the solid obtained was redissolved in DCM and precipitated into methanol ( $2 x$ ) and then dried under vacuum to give $\mathbf{P}_{\mathbf{2}}(54 \mathrm{mg})$ with $47 \%$ yield. For polymer $\mathbf{P} \mathbf{2}, \mathrm{M}_{\mathrm{n}}=76000 \mathrm{~g} / \mathrm{mol}$ and $D=1.2 .{ }^{\underline{1}}$

Figure $\mathrm{S}_{3}:{ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ spectrum of polymer 6 . The disappearance of the double bond after hydrogenation (m, 5.93$5.38 \mathrm{ppm})$ can be observed in the spectrum.

Figure $\mathrm{S}_{4}:{ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ spectrum of polymer $\mathbf{P}_{\mathbf{2}}$. The disappearance of the BOC-protecting group after its removal ( $\mathrm{s}, 1.4 \mathrm{ppm}$ ) can be observed in the spectrum.

Table Si: The Kuhn lengths and elasticity constants of all polymers used in this study.

| Polymer | Solution | Kuhn length (nm) | Elasticity constant (nN) |
| :--- | :--- | :--- | :--- |
| P1 | DMSO | $0.53 \pm 0.06$ | $20 \pm 3$ |
| P2 | DCB | $0.48 \pm 0.04$ | $10 \pm 1$ |
| cis-PB | methyl benzoate | $0.33 \pm 0.03$ | $25 \pm 4$ |

| PB | methyl benzoate | $0.44 \pm 0.02$ | $16 \pm 2$ |
| :--- | :--- | :--- | :--- |
| PE | methyl benzoate | $0.56 \pm 0.04$ | $30 \pm 5$ |
| PS | methyl benzoate | $0.81 \pm 0.06$ | $47 \pm 5$ |

Table S2: Tip/solid substrate chemistries used, isomerization forces and extension increases measured, and percent isomerizations calculated for the mechano-isomerization of $\mathrm{P}_{1}, \mathrm{~PB}$ and cis-PB.

| Polymer | Tip/solid | $F_{\mathrm{ct}}(\mathrm{pN})^{\mathrm{a}}$ | $\Delta x_{\mathrm{ct}}(\mathrm{nm})^{\text {b }}$ | L (nm) | $N_{\text {cis, }, ~}$ | $N_{\text {ct }}$ | \% isomerization |

${ }^{\mathrm{a}}$ An error of about 8 opN can be estimated for the isomerization force. ${ }^{\mathrm{b}}$ An error of about 100 pm can be estimated for the extension increase.
$N_{\text {cis }, \mathrm{L}}$ is the available number of cis double bonds in the contour length. It can be calculated from:

$$
\begin{equation*}
N_{\text {cis }, L}=\frac{L}{L_{\text {cis }}+(1 / \alpha-1) L_{\text {trans }}} \tag{1}
\end{equation*}
$$

where $L$ is contour length of the polymer, $L_{\text {cis }}$ and $L_{\text {trans }}$ are the contour lengths of the cis and trans isomers respectively (see schematic below), and $\alpha$ is the percent distribution of the cis isomers. $\mathbf{P l}_{1}, L_{\text {cis }}=1.118 \mathrm{~nm}, L_{\text {trans }}=1.239 \mathrm{~nm}$, and $\alpha=50 \%$. For PB and cis-PB, $L_{\text {cis }} \sim 0.3 \mathrm{~nm}$, and $L_{\text {trans }} \sim 0.4 \mathrm{~nm} . \alpha$ is equal to $36 \%$ and $98 \%$ in $\mathbf{P B}$ and cis-PB, respectively. In cases where more than one isomerization is observed in a single force versus extension profile, the secondary and tertiary $N_{\text {cis }, \mathrm{L}}$ is equal to the previous $N_{\text {cis }, \mathrm{L}}$ minus the number of isomerized cis double bonds, $N_{\mathrm{ct}}$. The latter can be calculated from:

$$
\begin{equation*}
N_{\mathrm{ct}}=\frac{\Delta x_{\mathrm{ct}}}{L_{\text {trans }}-L_{\mathrm{cis}}} \tag{2}
\end{equation*}
$$

where $\Delta x_{\mathrm{ct}}$ is the extension increase (Figure 1). Percent isomerization is then $N_{\mathrm{ct}} / N_{\mathrm{cis}, \mathrm{L}} \times 100$.

## cis-1,4-polybutadiene (PB) cis/trans-1,4-polybutadiene (cis-PB)

P1

Figure $\mathrm{S}_{5}$ : Examples of cis-to-trans isomerization in P1 using different AFM tips and solid substrates.

Figure S6: Force versus extension profiles of $\mathbf{P}_{\mathbf{1}}$ with transitions. FJC curve is reproduced using the mean values of the Kuhn length and elasticity constant, $\ell=0.53 \mathrm{~nm}$ and $K=20 \mathrm{nN}$, and is used as comparison agent only for illustration purposes. Orange is a typical approach and 1 and 2 are different retraction curves. The difference between each pre-transition section and the FJC curve is shown below each retraction profile. As a quantitative indicator of the goodness of the comparisons, the reduced $\tilde{\chi}^{2}$ statistics is also calculated and added to the differences. Unlike retraction 1 which strongly deviates from the FJC curve; retraction 2 deviates slightly. The difference between retraction 1 and the FJC curve is also obvious by the naked eye from the profiles. Retraction 2 is response from a single molecule.

Figure $\mathrm{S}_{7}$ : Force versus extension profiles of $\mathbf{P B}$ and cis- $\mathbf{P B}$ showing isomerization of cis double bonds.

Figure S8: Normalized force versus extension profiles of PB and cis-PB with no isomerization together with the FJC fit. Normalization of the profiles of $\mathbf{P B}$ is at 200 pN and normalization of the profiles of cis-PB is at 500 pN .

Figure S9: Normalized pre-isomerization sections of different force versus extension profiles of $\mathbf{P B}$ and cis-PB together with the FJC curve. The FJC curve is reproduced using the mean values of the Kuhn length and segment elasticity of each polymer (Table $\mathrm{S}_{1}$ ).

Figure Sı: Force versus extension profiles and normalized force versus extension profiles of $\mathbf{P 1}$ together with the FJC curve. The FJC curve is reproduced using the mean values of the Kuhn length and segment elasticity of the polymer (Table S1).

Figure Su1: Force versus extension profiles and normalized force versus extension profiles of PS together with the FJC curve. The FJC curve is reproduced using the mean values of the Kuhn length and segment elasticity of the polymer (Table S 1 ).

Figure S12: Force versus extension profiles and normalized force versus extension profiles of PE together with the FJC curve. The FJC curve is reproduced using the mean values of the Kuhn length and segment elasticity of the polymer (Table Sı).

Figure S13: Example of a transition event in the force versus extension profile of PE together with FJC curve. The FJC curve is reproduced using the mean values of the Kuhn length and elasticity constant of $\mathbf{P E}(\ell=0.56 \mathrm{~nm}$ and $K=30 \mathrm{nN})$ and is used as comparison agent only for illustration purposes. The difference between the pre-transition section of the force versus extension profile and the FJC curve is shown below. As a quantitative indicator of the goodness of the comparison, the reduced $\tilde{\chi}^{2}$ statistics is also calculated and added to the difference. There is disagreement between the pre-transition section of the force versus extension profile of PE and the FJC curve. The disagreement shows that the force versus extension profile is not from a single molecule that is firmly anchored between the AFM tip and the solid substrate.

Figure S14: Normalized force versus extension profiles of $\mathbf{P}_{\mathbf{1}}$ at varying pulling velocities.

Figure $\mathrm{S}_{15}$ : The cis-to-trans isomerization force $F_{\mathrm{ct}}$ of $\mathbf{P}_{1}$ as a function of the force rate $\mathrm{d} F / \mathrm{dt}$.

Figure S16: The percent isomerization as calculated in Table $\mathrm{S}_{2}$ as a function of the cis-to-trans isomerization force $F_{\mathrm{ct}}$.
