

Appendix I: Shifting cultivators in India								Consumed (C), grown (G), grown via shifting cultivation (SC)		
State	District	Vegetation Zone	Ethnic Group	Language	Comments	Reference	Staple foods	Rice	Millet	Tubers
Andhra Pradesh	Adilabad	Dry Deciduous (Terminalia-Anogeissus-Tectona)	Gond	D	Now taken to settled cultivation	Singh 1994a				
Andhra Pradesh	Visakhapatnam, Vizianagaram, Srikakulam and East Godowari	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Konda, Dora	D	Now settled agriculturalists.	Singh 1994a	Rice.	(C)		
Andhra Pradesh	Visakhapatnam, Vizianagaram and Srikakulam.	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Konda, Kapu	D	Hunter-gatherers and shifting cultivators	Singh 1994a				
Andhra Pradesh	Khammam	Moist/Dry Deciduous (Shorea-Terminalia-Adina)	Konda, Reddi	D		Singh 1994a	Sorghum, roots and tubers.			(C)
Andhra Pradesh	Visakhapatnam, Srikakulam and Vizianagaram	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Mukha Dora	D	Also sell forest produce	Singh 1994a	Ragi and rice, pulses.	(C)		
Andhra Pradesh	Srikakulam and Viziangaram	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Jatapu/Jatapu Dora	UU	Settled, shifting and terrace cultivation	Singh 1994a				
Andhra Pradesh	Srikakulam, Vizianagaram and Visakhapatnam	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Kondh	UU		Singh 1994a				

Andhra Pradesh	Visakhapatnam, Visianagaram and Srikakulam	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Kotia	UU	Settled and shifting agriculture in the hills. Also practice animal husbandry	Singh 1994a				
Andhra Pradesh	Godavari River	Dry Deciduous (Terminalia-Anogeissus-Tectona)	Koya, Konda, Rajulu	UU	Now sell herbal medicines	Singh 1994a				
Andhra Pradesh	Vishakhapatnam	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Kuliya	UU	Settled and shifting cultivation	Singh 1994a	Rice.	(C)		
Andhra Pradesh	Srikakulam	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Saora, Kapu	UU	Most now depend on settled cultivation, wage labour and firewood selling	Singh 1994a	Millets (cholu, samalu, korralu) and rice.	(C)	(C)	
Andhra Pradesh	Visakhapatnam	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Valmiki	UU	Shifting and terrace cultivation	Singh 1994a	Ragi, jawar and rice.	(C)		
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Khowa	IE		Singh 1994a, 1995a	Rice, maize and millet	(C) (SC)	(SC)	
Arunachal Pradesh	East Siang	Montane Wet Temperate	Adi, Ashing	ST	Shifting and terrace cultivation	Singh 1994a, 1995a	Rice, maize, millet, some leafy vegetables, seasonal fruits.	(C)	(C)	
Arunachal Pradesh	East and West Siang, Upper Subansiri	Montane Wet Temperate	Adi, Gallong/ Galong	ST	Wet rice cultivation and horticulture recently adopted	Singh 1994a, 1995a	Rice, maize, millet, some leafy vegetables, seasonal fruits.	(C)	(C)	
Arunachal Pradesh	East Siang, Mariyang subdivision	Montane Wet Temperate	Adi, Milang/ Millang	ST	Shifting and wet rice cultivation	Singh 1994a, 1995a	Rice, maize, millet, local pulses, wheat.	(C)	(C)	
Arunachal Pradesh	West Siang	Montane Wet Temperate	Adi, Pailibo	ST		Singh 1994a, 1995a				

Arunachal Pradesh	West Siang	Montane Wet Temperate	Adi, Ramo	ST		Singh 1994a, 1995a	Rice, maize, vegetables and pulses.	(C)		
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Aka	ST	Subsidiary collection of forest produce	Mehta 2004. Singh 1994a, 1995a	Maize, millet, rice and local pulses.	(C) (SC)	(SC)	(SC)
Arunachal Pradesh	West Siang	Montane Wet Temperate	Memba	ST	Shifting and wet cultivation.	Singh 1994a, 1995a	Rice, maize, millet, locally available vegetables, fruits, cucumber, beans, pumpkins, potatoes, chili.	(C)	(C)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Miji	ST	Shifting, terrace and wet paddy cultivation	Singh 1994a, 1995a				
Arunachal Pradesh	East Siang	Montane Wet Temperate	Mishing	ST	Were hunter,gatherer, fisher and trappers. Now practice shifting cultivation. Also grow pineapple and betel nut.	Singh 1994a, 1995a				
Arunachal Pradesh	Lohit	Montane Wet Temperate	Mishmi, Digaru	ST	Shifting as well as terrace and wet cultivation.	Singh 1994a, 1995a		(G)	(G)	
Arunachal Pradesh	Dibang Valley	Montane Wet Temperate	Mishmi, Idu	ST	Shifting and settled cultivation.	Singh 1994a, 1995a	Rice, millet, maize, pulses and vegetables.	(C)	(C)	
Arunachal Pradesh	Lohit	Montane Wet Temperate	Mishmi, Miju	ST	Now occupied in horticulture and government jobs.	Singh 1994a, 1995a	Maize, millet, pulses, rice and wheat.	(C)	(C)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Monpa, But	ST	Settled and shifting. Have started cultivating apples	Singh 1994a, 1995a	Maize, wheat, millet, buckwheat, rice, pulses and vegetables.	(C)	(C) (G)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Monpa, Diranh	ST	Shifting, terrace and wet paddy cultivation.	Singh 1994a, 1995a	Maize, rice, millet, wheat and buckwheat.	(C)	(C)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Monpa, Kalaktang	ST	Shifting, terrace and wet paddy cultivation.	Singh 1994a, 1995a	Rice, maize, millet and leafy vegetables.	(C)	(C)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Monpa, Lishpa	ST	Shifting and settled cultivation.	Singh 1994a, 1995a	Rice, barley, millet, wheat and buckwheat.	(C)	(C)	
Arunachal Pradesh	Tawang	Montane Wet Temperate	Monpa, tawang	ST	Slash and burnt, terrace and wet paddy cultivation.	Singh 1994a, 1995a	Cereals.			
Arunachal Pradesh	Lower Subansiri	Montane Wet Temperate	Nishi	ST	Horticulture and animal husbandry subsidiary	Singh 1994a, 1995a	Rice, wheat, maize and millet.	(C)	(C)	

Arunachal Pradesh	Tirap	Montane Wet Temperate	Nocte	ST	Also adopted wet and terrace cultivation.	Singh 1994a, 1995a	Rice, millet, cereals and vegetables.	(C)	(C)	
Arunachal Pradesh	West Kameng	Montane Wet Temperate	Sherdukpen	ST	Shifting, terrace and wet paddy cultivation	Singh 1994a, 1995a	Buckwheat, millet, maize and other cereals, vegetables, soya beans, leafy vegetables, seasonal fruit and rice.	(C)	(C)	
Arunachal Pradesh	East Kameng and Lower Subansiri	Montane Wet Temperate	Sulung	ST	Hunting and gathering, fishing, trapping, shifting cultivation and wage labour.	Singh 1994a, 1995a	Rice, maize, millet, wild sago palm and vegetables.	(C)	(C)	
Arunachal Pradesh	Upper Subansiri	Montane Wet Temperate	Tagin	ST	Slash and burn agriculture	Singh 1994a, 1995a	Rice and vegetables.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Havi	ST	Shifting hill cultivation. Settled farming and wet cultivation in the plains.	Singh 1994a, 1995a	Rice, maize, millets and pulses.	(C)	(C)	
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Jugli	ST	Slash and burn agriculture	Singh 1994a, 1995a	Rice.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Kimsing	ST	Started settled farming	Singh 1994a, 1995a	Rice, maize and vegetables.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Lungphi	ST	Settled agriculture practised on flat lands.	Singh 1994a, 1995a	Rice.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Lungri	ST	Slash and burn agriculture, recently engaged in wet rice cultivation	Singh 1994a, 1995a	Rice, maize, millet, local pulses, fruits, roots, tubers and vegetables.	(C)	(C)	(C)
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Morang	ST	Wet rice cultivation has now replaced traditional practice of slash and burn	Singh 1994a, 1995a				
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Mosang	ST		Singh 1994a, 1995a	Rice, vegetables, pulses, roots, tubers and fruits.	(C)		(C)
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Muklom	ST	Slash and burn cultivation	Singh 1994a, 1995a	Rice.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Tonglim	ST		Singh 1994a, 1995a	Rice, maize, pulses and vegetables.	(C)		
Arunachal Pradesh	Changlang	Montane Wet Temperate	Tangsa, Yongkuk	ST	Shifting and settled cultivation	Singh 1994a, 1995a	Rice, millet and maize.	(C)	(C)	

Arunachal Pradesh	Tirap	Montane Wet Temperate	Wancho	ST	Slash and burn cultivation. Recently adopted terrace and wet cultivation.	Singh 1994a, 1995a	Rice, millet and vegetables.	(C)	(C)	
Arunachal Pradesh	East Siang	Montane Wet Temperate	Minyong	UU		Jagirdar 1987		(SC)		
Assam	Jantia Hills	Tropical Moist Deciduous	Jaintia	AA		Singh 1994a				
Assam	Barak valley	Tropical Wet Evergreen	Kachari, Barman	IE	Shifting and wet cultivation.	Singh 1994a	Rice.	(C)		
Assam	North Cachar, Kabi Anglong	Tropical Wet Evergreen	Kachari, Dimso	IE	Slash and burn	Singh 1994a	Rice.	(C)		
Assam	North Cachar and Cachar	Tropical Wet Evergreen	Hmar	ST	Many are landless.	Singh 1994a				
Assam	Sibsagar	Tropical Wet Evergreen	Naga, Konyak	ST	Now occupied in sharecropping and wage labour.	Singh 1994a				
Assam	Karbi Anglong	Tropical Wet Evergreen	Naga, Rengma	ST	Wet cultivation and shifting cultivation.	Singh 1994a	Rice.	(C)		
Assam	North Cachar, Karbi Anglong and Cachar	Tropical Wet Evergreen	Kuki	UU		Singh 1994a				
Central India		Dry-Moist-Deciduous (mostly)	Gond?	D	Some cultivate government land	Singh 1994a				
Chattisgarh	Raigarh	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Asur	AA		Singh 1994a				
Chattisgarh	Surguja, Raigarh and Bilanpur	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Korwa	AA	Now settled agriculturalists.	Singh 1994a	Rice, wheat and jowar.	(C)		

Chattisgarh	Bastar	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Gond, Abuj Maria	D		Singh 1994a	Rice, maize, roots, tubers, leaves, pulses (kulthi and urad)	(C)		(C)
Chattisgarh	Bastar	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Gond, Bison Horn Maria	D	Roots and tubers from forest	Singh 1994a	Rice, pulses (kulthi and urad), roots, tubers, local seasonal fruit and vegetables.	(C)		(C)
Chattisgarh	Raipur	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Kamar	D	Shifting cultivation and basketry	Singh 1994a	Rice and media.	(C)		
Chattisgarh	Bastar	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Bhattras	IE	"...giving up their very modified form of shifting cultivation" in favour of permanent rice fields.	Grigson 1949	Rice.	(C)		
Chattisgarh	Bilaspur	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Majhwar	UU	Now settled cultivators	Singh 1994a	Rice and wheat, wild roots and tubers, leaves and fruits.	(C)		(C)
Chattisgarh	Surguja and Raigarh	Dry-to-Moist Deciduous (Terminalia-Anogeissus-Cleistanthus)	Nagesia	UU	Now settled agriculturalists and wage laborers.	Singh 1994a	Rice, wheat, jowar and bajra.	(C)

Nagaland, Manipur, Assam		Montain Wet Temperate	Naga	ST	Shifting and terrace cultivation. Kitchen gardens produce: cole crops, roots, bulbs, beans etc.	Singh 1994c		(G)	(G)	
Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Bondo/ Bonda	AA		Mohanty 2004, Singh 1994a, Patnaik 2005	Ragi, rice, roots and tubers, fruits (mango, banana, jackfruit, berries, tamarind), maize, vegetables, chili, millet.	(C) (G)	(C)	(C)

Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Didayi	AA	Shifting cultivation in the hills. Didayi from plains now practice settled agriculture	Singh 1994a, Patnaik 2005	Rice, ragi, pulses (peas and beans) niger seed, roots, tubers, cucumber, beans, green leaves, cereals, bamboo shoots	(C) (G)	(G)	(C)
Orissa	Keonjhargarah and Dhenkanal	Moist/Dry Deciduous (<i>Shorea-Dillenia-Pterospermum</i>)	Juang	AA	Wet land and shifting cultivation employed. Samualls (1856), Dalton (1872) and Hunter (1877) record the Juang as NOT shifting cultivators.	Singh 1994a, Patnaik 2005	Rice and ragi, fruits, tubers and roots, beans and moong dal.	(C) (G)		(C) (G)
Orissa	Throughout the state	Moist/Dry Deciduous	Saora	AA	Shifting and terrace cultivation.	Singh 1994a	Rice, ragi, millet, pulses and vegetables, roots, fruits and tubers collected from the forest.	(C)	(C)	(C)
Orissa	Ganjam and Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Saora, Lanja	AA	Shifting and wet terraced cultivation	Singh 1994a, Patnaik 2005	Rice, millet and pulses, some edible leaves.	(C) (G) (SC)	(C)	
Orissa	Koraput; Ganjam, Kalahandi, Sundargarh	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Gadaba	D	Also located in agency area, Andhra Pradesh and Bastar district, Madhya Pradesh	Singh 1994a	Rice, ragi	(C)		
Orissa	West	Moist Deciduous (<i>Shorea-Buchanania-Cleistanthus</i>)	Gond	D		Singh 1994a				
Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Jatapu/ Pandara Kula Chatriya	D	Settled and shifting cultivation	Singh 1994a				
Orissa	Kandhamal	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Kond, Kutia	D		Patnaik, 2005	Rice, millets, vegetables, mango.	(C)	(C) (G)	

Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Konda, Dora	D	Shifting cultivation is primary occupation	Singh 1994a				
Orissa		Dry-to-Moist Deciduous (<i>Terminalia-Anogeissus-Cleistanthus</i>)	Kondh	D	Engaged in shifting agriculture, settled agriculture and animal husbandry.	Singh 1994a	Ragi and rice.	(C)		
Orissa	Cuttach, Koraput and Kalahandi	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Kondh, Dangria	D	Mainly grow fruit, shifting cultivation used to be practiced extensively.	Singh 1994a, Patnaik 2005	Ragi, rice, jowar and kosora, pulses, fruits, roots and tubers.	(C)	(C) (G)	
Orissa	Kalahandi	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Kondh, Dongaria	D	Shifting cultivation, plains land cultivation and horticulture	Seeland and Schmithüsen 2002	Ragi, rice, sweet potato, yam, leafy vegetables, fruits and maize.	(C) (G)	(C)	(C) (G)
Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Kondh, Kuwi	D	Terrace and shifting cultivation	Singh 1994a				
Orissa	Kondha	Dry-to-Moist Deciduous (<i>Terminalia-Anogeissus-Cleistanthus</i>)	Kondh, Sitha	D	Largely landless, but some shifting and some settled cultivation	Singh 1994a	Rice, seasonal fruits.	(C)		
Orissa	Koraput	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Koya	D		Singh 1994a				
Orissa	Koraput and Kalahandi	Moist/Dry Deciduous (<i>Shorea-Terminalia-Adina</i>)	Paroja, Pengo	D		Singh 1994a	Rice, ragi, maize, barley.	(C)		

Orissa	Keonjargarh, Dhenkanal, Sundargarh	Moist/Dry Deciduous (Shorea- Dillenia- Pterospermum)	Bhunya, Paudi	IE	Shifting and settled. Forest collection is highly important, poorer families depend on forest produce for half the year	Singh 1994a, Patnaik 2005	Fields: Rice, black gram, niger, mustard, maize, ragi, suan, gulchi, kangu, green leaves, vegetables, mushrooms, tubers. Trees: jackfruit, mango, tamarind. Forest: tubers, rhizomes, leaves and shoots, fruits, flowers (mahua), seeds (mahua), grains, mushrooms, harida, anala, sal seed, kusum.	(C) (G) (SC)	(G)	(C)
Orissa	Koraput	Moist/Dry Deciduous (Shorea- Terminalia-Adina)	Paroja	IE	Shifting cultivation on hill slopes, plough cultivation on flat fields and irrigated terraces.	Singh 1994a	Ragi, rice.	(C)		
Orissa	Mayurbhanj, Keonjhar	Moist/Dry Deciduous (Shorea- Dillenia- Pterospermum)	Bathudi	UU	Discontinued shifting cultivation since last century	Singh 1994a	Rice, pulses and several leafy vegetables.	(C)		
Orissa	Keonjhar, Sundargarh, Mayurbhanji, Sambalpur	Moist/Dry Deciduous (Shorea- Dillenia- Pterospermum)	Bhuinya/ Bhuiya	UU	Shifting and settled agriculture, hunting. Weekly markets	Singh 1994a, Patnaik 2005	Rice, pulses- gram and pigeon pea.	(C)		
Orissa	Kalahandi	Moist/Dry Deciduous (Shorea- Terminalia-Adina)	Bunja (Chuktia)	UU	Shifting and low-land paddy cultivation.	Patnaik 2005	Rice, kendu, mango, jack fruit, mohua, tamarind and jamun.	(C) (G)		
Orissa	Koraput	Moist/Dry Deciduous (Shorea- Terminalia-Adina)	Mali	UU	Both settled and shifting	Singh 1994a	Rice, maize and ragi.	(C)		
Tamil Nadu	Nilgiri Hills	Montane Wet Evergreen (Shola)	Kota	D	Shifting and settled agriculture. Also animal husbandry	Singh 1994a	Rice, jowar, ragi, pulses and vegetables.	(C)		

Tamil Nadu	Coimbatore	Moist Deciduous (<i>Tectona-Dillenia-Lagerstromia-Terminalia paniculata</i>)	Muduvan	D	Slash and burn cultivation and horticulture practiced in the reserve forests. Produce cardamom and lemon-grass	Singh 1994a			
Tripura	North and West Tripura	Tropical Moist Deciduous	Khasia	AA		Singh 1996	Rice, vegetables, pulses, roots and tubers	(C)	(C)
Tripura	North	Tropical Moist Deciduous	Chakma	IE		Singh 1996	Bamboo shoots, moong, masur, potatoes, onions, cabbages, roots and tubers, wild <i>panalu</i> , wild <i>thadalu</i> .	(G)	(C)
Tripura	South Tripura	Tropical Moist Deciduous	Jamatia	ST	Shifting cultivation of undulating hills under government control. Wet cultivation on the plains is secondary.	Singh 1996	Rice, bamboo shoots, potato, gourd, onions, vegetables (<i>arai</i>), tubers (<i>batema</i>), fruits (<i>thaiserem</i>), beans, moong, masur.	(C)	(C)
Tripura		Tropical Moist Deciduous	Kuki	ST		Singh 1996	Rice, maize, moong, masur, peas, beans, local roots, local fruits and local vegetables.	(C)	
Tripura	South Tripura	Tropical Moist Deciduous	Mag	ST	Now plough cultivators	Singh 1996	Rice, bamboo shoots, pulses, local vegetables (<i>snakang</i>), jackfruit, pineapple, tubers (<i>mroiloi</i> , <i>mrongmuî</i>).	(C) (G)	(C) (G)
Tripura	West Tripura	Tropical Moist Deciduous	Tripuri	ST	Largely settled cultivation, some slash and burn still practiced	Singh 1996	Rice, masur, moong, urad, gram, khesari, locally available roots and tubers, vegetables and fruits.	(C)	(C)

Tripura	<i>South and West</i>	Tropical Moist Deciduous	Halam, Kaipeng	UU	Also rear domestic animals	Singh 1996	Rice., bamboo shoots, masur, matar, potatoes, onions, wild vegetables like <i>ancham</i> , wild tubers like <i>thingkui</i> , wild fruits like <i>jangmani</i> , mango, jackfruit and pineapple.	(C)		(C)
Tripura	<i>South and West</i>	Tropical Moist Deciduous	Halam, Kaloi	UU	Also rear poultry. Shifting cultivation lands owned by government. Plains lands are individually owned.	Singh 1996	Rice. Bamboo shoots, potatoes, onions, vegetables, tubers, wild fruit (<i>arai, thalamar, thaipang</i>) monng, masur, beans.	(C) (G) (SC)		(C)
Tripura	South Tripura	Tropical Moist Deciduous	Halam, Molsom	UU	Some have adopted plough cultivation or cultivate on a share cropping basis.	Singh 1996	Rice, vegetables and pulses (gram, lentil).	(C)		
Tripura	West Tripura	Tropical Moist Deciduous	Halam, Rupini	UU	Adopted settled cultivation in recent years. Also rear goats and poultry to supplement income.	Singh 1996	Rice, bamboo shoots, potatoes, onions, vegetables (<i>gantha, chichiri</i>), tubers (<i>thablong, kongka</i>), fruits (<i>thilik, thaiselem</i>), beans, masur and moong.	(C)		(C)
Tripura	South Tripura	Tropical Moist Deciduous	Noatia	UU	Recently adopted plough cultivation.	Singh 1996	Rice, market bought brinjals and potatoes, wild <i>samsata, balangtha</i> and <i>thaisua</i> , bamboo shoots, moong and masur.	(C)		(C)
Tripura	South Tripura	Tropical Moist Deciduous	Uchai	UU	Shifting and, recently, some plough cultivation	Singh 1996	Rice.	(C)		
West Bengal	Puruliya	Subtropical broadleaved hill forest	Santal	AA	Slash and burn, dry, wet cultivation and plough cultivation.	Bhowmick 2004, Sinha 1985	Millet, maize, lentils and rice, fruits, leaves, roots, tubers	(C) (G)	(C) (SC)	(C)

West Bengal	Darjeeling	Subtropical broadleaved hill forest	Bhutia	UU	Traditional occupation, now cultivate millet	Singh 1994a

Table B: Summary of the diversity and dominance of weed taxa identified during rice field surveys. A = most frequent, G = least frequent, 0 = not recorded. Numbers of species per category is in brackets and the total number of taxa recorded per field is shown at the bottom of the table. From Weisskopf et al. (2013).

Field I8	Survey points					
	1	2	3	4	5	6
Description		5-10 cm water		1-2 cm water	c.5cm water	
<i>O. rufipogon</i> . Flowering	xx					
<i>O. minuta</i> type. In flower. Perennial	xxx					
<i>Paspalum</i> sp.	xxx	xx				xx
Shrubby crucifery, yellow flowers	xx			xx	xx	xx
Little <i>Panicum</i> type 2	xx					
<i>Commelina</i> type	xx			x		xx
<i>Nymphaea</i> sp.- deeper water	xxx					
Commelinaceae, not <i>Commelina</i> sp.	xx			xx	x	xx
Monocot, white flower, floating aquatic	x					
Decussately opposite, serrated leaved scrof	x					
<i>Cyperus</i> sp.	xx	xx		xxx	xx	
Alternate, ovate leaved ground cover	x					
Alternate leaved ovate dicot	x					
<i>Scirpus</i> sp.	xx	xxx		x		xx
<i>Phyllanthus</i> sp.		xx				xx
Red veined <i>Cyperus</i>		xx		xx		xxx
Commelinaceae/lilliaceae with grass like leaves		xx				
<i>Eriocaulon</i> sp.	xxx	xxx	xxx	xxx	xxx	xxx
<i>Panicum</i> type 1	x			xxx	xxx	xxx
tall <i>Eragrostis</i> sp.	xx					
Bristleless grass	xx					
<i>Mimosa</i> sp.	xx					
Amarilidaceae type/ <i>Eriocaulon</i> sp.	xx	xx			xxx	xx
Decussately opposite, red stalked.	xx	xx	xx		xx	x
Alternate leaved reniform, erect	xx	x	xx		xx	xx
Thin strap like leaves, decussately opposite, probs crucifery		xx				x
Ovate, pointy leaves. Small erect			xx			
Serrate leaved <i>Scrophulariaceae</i>			x	x		xx
Alternate, ovate dicot from before				x		
<i>Phyllanthus</i> sp? <i>Mimosa</i> sp.?				xx	xx	
Spiked grass, no bristles						xx
Opposite, purple tinged leaves, axillary fruits						xx
<i>Eragrostis</i> sp.			x			xx
Op. leaves, squarish stems, purple flowers					x	
'Tilliaceae'						x
Urticaceae type. Decussately op. Hairy. Round red stalk, serrated leaves					x	
Trifoliate, somewhat erect						x

Table C: An example of the field data collected on survey. xxx = 4+ plants per meter square, xx = 2-4 plants, x = 1 plant. Plants were pressed and are in the process of being identified. Over 600 specimens have been collected.

Appendix IV: Phytolith terms used in this study and their ICPN equivalent.

	ICPN nomenclature	Notes
Single cells		
Long smooth	Elongate psilate - epidermal long cell	
Long sinuate	Elongate sinuate - epidermal long cell	
Long rods	Elongate psilate/Cylindric smooth - epidermal long cell	Long and narrow - from the Cyperaceae
Long dentritic	Elongate dentritic - epidermal long cell	Grass inflorescence
Stomata		
Papilae	Papilae cell	Glumes
Hair	Hair cell	
Bulliform	Parallepedal bulliform	Grass leaf
Cuneiform bulliform		Grass leaf
Oryza type cuneiform bulliform		Oryza sp. leaf
Crenate		
Bilobe		Found in many Panicoid grasses
Setaria type bilobe		
Oryza type bilobe	Bilobate - concave apexes - epidermal short cell	
Cross	Quatra-lobate - epidermal short cell	Found in some Panicoid grasses
Rondels		
Stipa type rondel		
Saddles		From the Chloridoid grasses
Collapsed saddle	Epidermal short cell	From the Bambusoideae
Cones	Conical	Cyperaceae inflorescence
Sedge achene		
Double-peaked glume cell	Bi-echinate - epidermal cell	Specific to Oryza sp. husk
Smooth spheroid	Globular psilate	
Echinate spheroid	Globular echinate	From the Areaceae
Verrucate		
Crescent		
Long echinate	Elongate echinate	Dicots

Appendix IV: Phytolith terms used in this study and their ICPN equivalent.

	ICPN nomenclature	Notes
Long irregular	Elongate irregular	Dicots
Trachied		
Two-tiered		
Block	Square rectangular psilate	
Platey		
Sheet	Irregular shape psilate	
Single polyhedron	Polyhedron shape psilate	Dicot leaves
Scalloped	Irregular shape	Dicots, some specific to Cucurbitaceae
Single jigsaw	Multi-lobate irregular pattern	
Multi-cell panels		
Hair base		Anatomical term
Leaf/culm indeterminate		
Leaf/culm long cells	Elongate psilate - epidermal long cells	
Leaf/culm bilobe	Bilobate - epidermal short cells	
Leaf/culm saddle	Saddle - epidermal short cells	
Leaf/culm cross	Quadra-lobate - epidermal short cell	
Leaf/culm cf. <i>Panicum</i>		
Leaf/culm <i>Oryza</i>		
Leaf/culm <i>Phragmites</i>		
Leaf/culm reed		cf <i>Phragmites</i> but with fewer ID criteria
Leaf/culm square cell		
Leaf/culm stomata		
Husk indeterminate		
<i>Setaria</i> husk		
<i>Panicum</i> husk		
Millet type 1 husk		Similar to <i>Setaria</i> sp. but without all ID criteria
Millet type 2 husk		Similar to <i>Panicum</i> sp. but without all ID criteria
<i>Oryza</i> husk	Bi-echinate - epidermal cells	Double peaked glume hairs - specific to <i>Oryza</i> sp.

Appendix IV: Phytolith terms used in this study and their ICPN equivalent.

	ICPN nomenclature	Notes
Cyperaceae		
Mesophyll		
Indeterminate multicell		
Indeterminate phytolith

Table K: Length (L), height (H) and width (W) of measurable rice grains from Mantai (mm).

P value	Number of rice grains
1	54
2	133
3	138
4	1355
5	422
6	16

Table L: Preservation values for rice grains identified at Mantai.

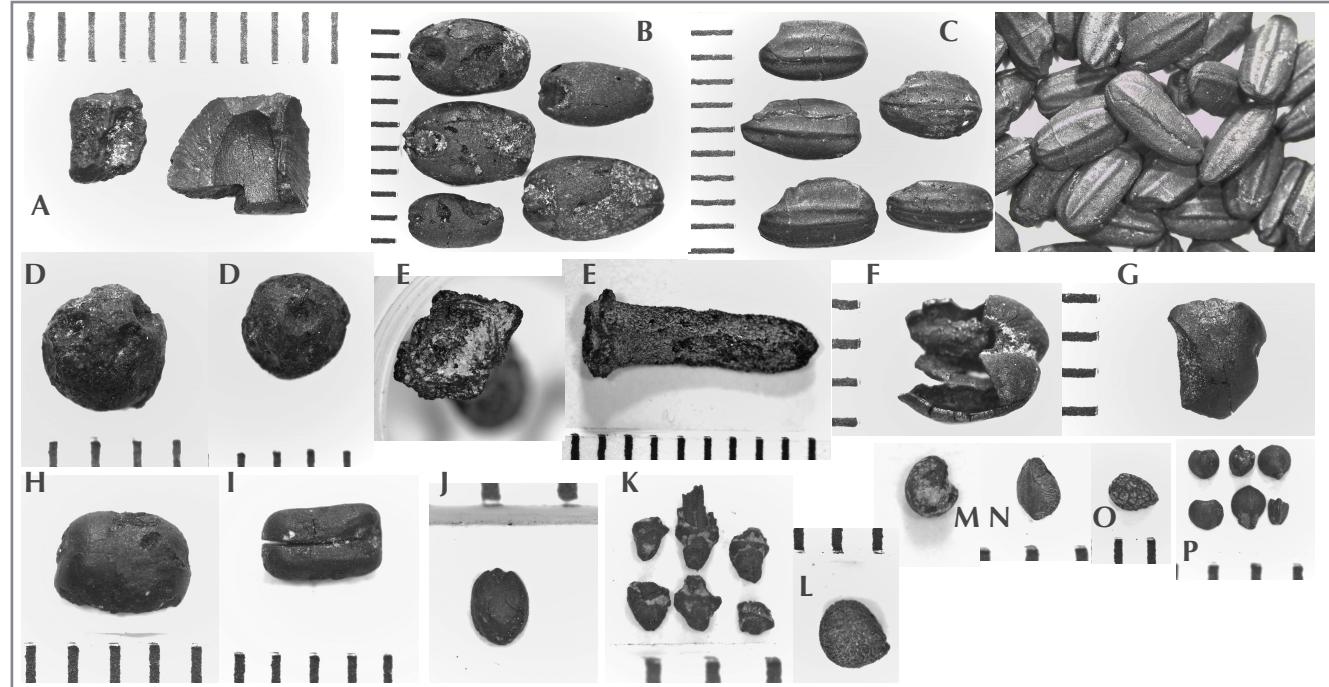

Figure E: Macro remains from Mantai. Scale in mm. A) *Canarium* sp. nut shell B) *Triticum aestivum/durum* C) *Oryza sativa* cf. *japonica* D) *Piper nigrum* E) *Syzygium aromaticum* F) *Vitis* sp. G) *Lens* sp. H) *Vigna* sp. I) *Vigna* cf. *radiata* J) *Setaria verticillata* K) *Oryza sativa* ssp. spikelet bases L) *Stellaria media* M) Amaranthaceae N) *Bulbostylis capillaris* O) *Rubus* sp. P) *Cyperus* sp. rounded

Figure A: A Cucurbitaceae type scalloped phytolith from Tokwa, sample 15.

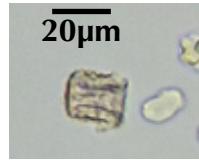

Figure B:
Commelinaceae type
single cell

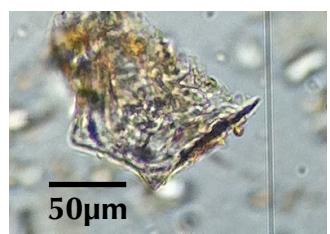

Figure C: Double peaked
glume cell from *Oryza* sp.

Appendix VII: Phytolith numbers per gram, all sites. TKW-Tokwa GBSN- Golbai Sasan KDM-Kodumanal PRR-Perur Man-Mantai

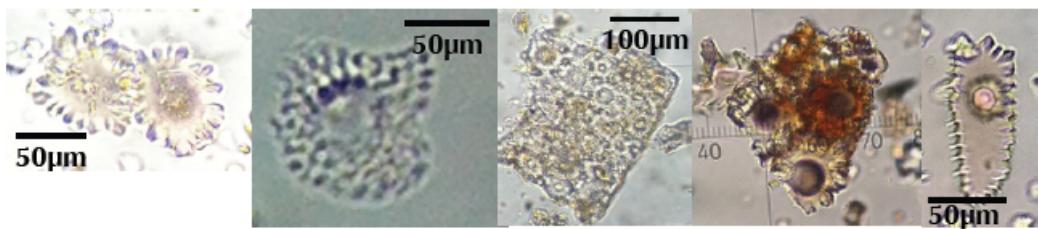

Figure E: Sedge achene phytoliths

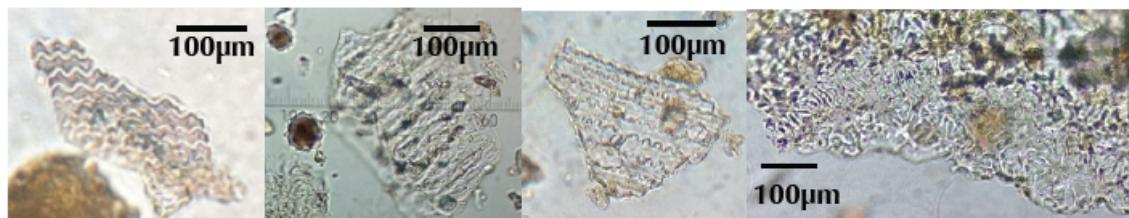

Figure F: Husk multi-cells, left to right- indet., cf. *Oryza* sp., indet. millet type 2.

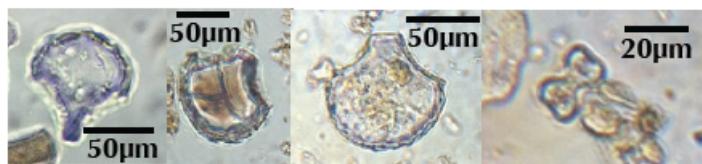

Figure G: *Oryza* sp. single cells. Cuneiform bulliforms on the left, bilobe on the right.

Figure H: Left- bilobe muti-cell leaf/culm panel. Right- Bulliform multi-cell leaf/culm panel.

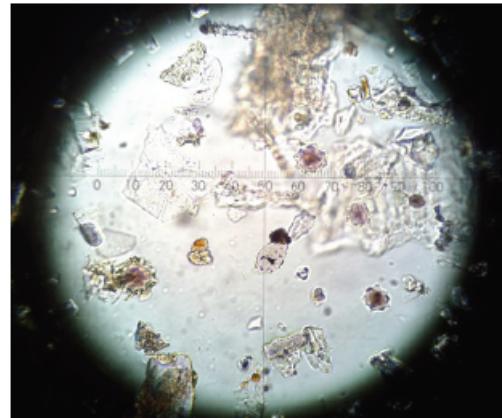

Figure I: A typical view down the microscope at sample 52 from Mantai. Note the high occurrence of echinate spheroids.

Appendix VIII: Rice single cell:multi-cell ratios.

The relative frequencies of cf. *Oryza* sp. single cells and multi-cell panels in phytolith samples from all sites were plotted in a scatter plot, in order to identify possible irrigation of the rice crop. This method follows the theory outlined by Madella et al. (2009) that irrigated cereal crops will produce a higher proportion of multi-cell panels than a non-irrigated cereal crop.

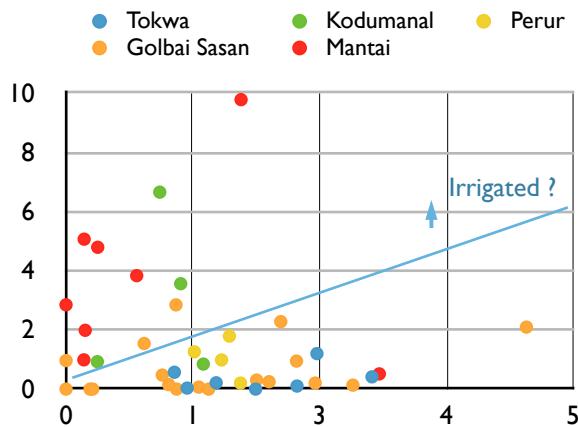

Figure A: Scatter plot of cf. *Oryza* sp. single and multi-cell frequencies.

13 samples contained higher frequencies of multi-cell panels than single cells, suggesting possible irrigation of the crop. These samples are from Golbai Sasan, Kodumanal and Mantai. However several other samples from these sites had much higher frequencies of single cells than multi-cell panels. Therefore the average frequency of single and multi-cells were calculated. Figure A clearly shows that Kodumanal and Mantai have much higher multi-cell panel frequencies than single cell frequencies. This suggests high water levels, however this is contradictory to the rest of the data. The obvious reason for this is an identification bias. Where rice type multi-cell panels are present, they are often easier to identify as cf. *Oryza* than single cells.

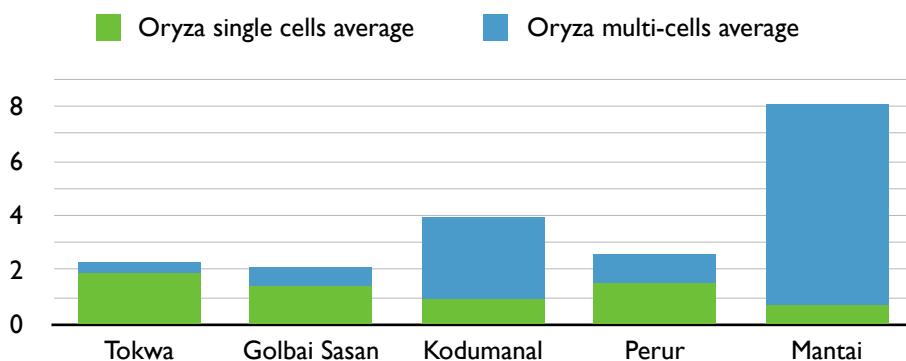

Figure B: Bar chart showing the average relative frequencies of cf. *Oryza* single and multi-cell panels.

Bearing in mind possible preservation biases that are indicated in the data, e.g. the universal poor preservation of macro remains and the mixed sources of waste at Mantai, it was decided that whilst this method may be useful, CA provides a more holistic view of the data.

Appendix IX: Functional and biological attributes of weeds identified in macrobotanical samples, following Jones et al. (2005, 2010). Information from: Galinato et al 1999, Haines 1925, Jacquot and Courtois 1987, Matthew 1988, Moody 1989, Nasir and Ali 1982, Noda et al 1985, Sahu 1992, Saldanha 1984, Sharma et al 1996, Singh and Walia 2010, Tadulingam and Ventatanarayana 1985, Soerjani et al 1987, theplantlist.org, plants.usda.gov, kew.org/data.

Taxa	Notes	Ecology	Biological and Functional attributes
<i>Bromus ramosus</i>	Hairy brome. Native to Europe and SW Asia.	Prefers shady sites and well drained soils. Found along hedgerows and in woodland margins in Europe. Unlikely to be a rice weed, however likely dispersed with SW Asian crops into India. A minor weed of wheat/barley fields.	Up to 1.5m in height. Seed size and dormancy are less than in other <i>Bromus</i> species. Positive potential productivity.
<i>Chenopodium</i> sp.	The goosefoots. Around 200 species, including <i>C. album</i> or 'bathuwa' cultivated in, but not native to, N India, and <i>C. giganteum</i> "tree spinach".	A cosmopolitan genus. Tend to prefer rich soils.	Can grow up to 2m in height. Many species produce many seeds. Unclear.
Poaceae (small grass)	The grasses. The fifth largest plant family, over 10,000 species.	Poaceae are found in every environment, except the poles.	The family is too large and varied to describe functional attributes. Unclear.
cf. <i>Lolium</i> sp.	The ryegrasses. 9 species, including <i>L. perenne</i> , <i>L. temulentum</i> and <i>L. persicum</i> .	<i>Lolium</i> sp. is an important pasture plant in the temperate zones, where it outcompetes other species.	Produce large numbers of seed. Little dormancy. Little vegetative reproduction and correspondingly small root system. Unclear.

Table I:Tokwa

Taxa	Notes	Ecology	Biological and Functional attributes
<i>Commelina</i> sp.	Dayflowers. 170 species. 7 species are native to India including <i>Commelina benghalensis</i> , <i>C. carolinaria</i> , <i>C. paludosa</i> and <i>C. undulata</i> (book ref.)	Most species are found in wet lands, swamps and along rivers. <i>C. benghalensis</i> is a common weed of wet fields and crops across Asia and is a serious weed of a variety of crops (including rice) in India.	Flowers and germinates throughout the growing season. Generally produce one large seed and four smaller seeds. Smaller seeds have a strong dormancy. Larger seeds can emerge from depths of up to 6" (GISD 2014) Disturbance
Cyperaceae	The sedges. Around 5,000 species, 110 genera. 1000s of species native to India, although no clear estimate is available.	Can be found in nearly all environments, but most are associated with wetlands. Another serious weed of rice, with <i>Cyperus iria</i> , <i>Cyperus difformis</i> , <i>Fimbristylis miliacea</i> and <i>Schoenoplectus juncoides</i> all native to India and listed under IRRI's dirty dozen (IRRI 2014).	Many sedges reproduce both vegetatively and with seeds. Some rely primarily on vegetative reproduction. Horizontal root systems can be very large. Seeds are often small (e.g. <i>Fimbristylis</i> sp.) but can be large (e.g. <i>Schoenoplectus</i> sp.). Those identified here were of an average size for sedges. Unclear
<i>Echinochloa</i> sp.	A genus of grasses which includes several millet crops. Around 35 species, including <i>E. frumentaceae</i> .	Several species are weeds of crops, including <i>E. colona</i> and <i>E. crus-galli</i> which are both members of IRRI's dirty dozen. <i>E. colona</i> is a mimic weed of rice which looks very similar during the vegetative stage. Generally prefers moist and wet fields. Some species can live in aquatic conditions.	Flowers throughout the year. Seeds have a short dormancy, but some plants can produce a large number of seeds (inc. <i>E. crus-galli</i> @ <40,000 a year). Can reproduce vegetatively. Some species produce many, large rhizomes. Plants are responsive to nutrients. Up to 1.5m tall. Disturbance. Positive potential productivity.
cf. <i>Ipomoea</i> sp.	The morning glories. Around 500 species. Approx. 26 native to India, as recorded in Haines (1925)	Some species prefer dry scrubland, others are semi-aquatic. Ipomoeas were identified in several rice fields during field surveys, however these may have been introduced species.	Generally climbing plants, several produce large tubers most notably the sweet potato (<i>I. batatas</i>). Harvesting by uprooting or cutting plant near the base.

Table II: Golbai Sasan

Taxa	Notes	Ecology	Biological and Functional attributes
cf. Liliaceae	The lilies. Around 600 species. 26 species listed as native in Haines (1925).	Liliaceae are found in a wide variety of habitats, with the majority in the Northern Hemisphere.	Often bulbous plants, however this is such a varied family that particular functional attributes cannot be discussed. Unclear
Poaceae	The grasses. The fifth largest plant family, over 10,000 species.	Poaceae are found in every environment, except the poles.	The family is too large and varied to describe functional attributes. Unclear
Potulaceae	The purslanes. Around 100 species. <i>P. oleracea</i> native to India,	Several prefer dry soils, although some are weeds of fields. Some prefer disturbed habitats. <i>P. oleracea</i> is a succulent, however it has been reported as a weed of wet rice fields.	Seeds are generally large (c. 1mm across). Growth habit tends to be spreading. Unclear
cf. <i>Rumex</i> sp.	The docks. Around 200 species. <i>R. angulatus</i> , <i>R. patientia</i> and <i>R. dentatus</i> amongst those reported as native to India.	A typical plant of disturbed areas, also tend to prefer moist areas. <i>R. dentatus</i> in particular can often be found at the edges of cultivated fields throughout Eurasia.	Most species have long tap roots, many grow quite tall (c.70 cm high). Unclear
<i>Schoenoplectus</i> sp.	Club-rushes. Approx. 35 species. 10 species reported native to India.	Club-rushes are wet land residents. <i>S. juncoide</i> s is fairly common in wetter rice fields across Asia.	Grows from 10cm to 3m tall, most species are tall. Can propagate vegetatively through rhizomes, also produces nuts which can be quite large(c.1-4mm across). Disturbance. Inter-annual instability of habitat conditions.

Table II cont.: Golbai Sasan

Taxa	Notes	Ecology	Biological and Functional attributes
cf. <i>Scirpus</i> sp.	Another sedge genus, often also called club-rush or bulrush. Around 120 species. How many are native to India is unknown.	An aquatic genus with a cosmopolitan distribution.	Seeds tend to have a long dormancy period, although some can be quite small and therefore have a shorter dormancy. Some species have quite large seeds (c. 2mm across). They can also propagate vegetatively and produce rhizomes. Disturbance. Inter-annual instability of habitat conditions
<i>Sida</i> sp.	Often simply known as the sidas. Approx. 150+ species. 11 species reported as native to India, including <i>S. mysorensis</i> (specific to Mysore) and <i>S. cordifolia</i> .	Botanical texts do not provide much information, however several sidas are common to cultivated ground.	The family is too large and varied to describe functional attributes. Unclear.

Table II cont.: Golbai Sasan

Taxa	Notes	Ecology	Biological and Functional attributes
cf. <i>Andropogon</i> sp.	A genus of grasses. Around 100 species, including <i>A. muricatum</i> , from which vetiver (fragrant oil) is made.	It has been difficult to find info. on Indian Andropogons, however species seem to occur in a variety of habitats.	Tend to reproduce via seeds rather than vegetatively. Some species have seeds that are adapted to catch on animal fur, so prefer areas where 'foot traffic' is high. Unclear.
<i>Cyperus</i> sp.	The largest genera of sedges. Around 600 species worldwide, approx. 70 reported from India (Hooker 1879, Nair and Henry 1983))	Largely adapted to wet lands, river banks and swamps. Common weeds of rice fields, both irrigated and rainfed.	Reproduce vegetatively from rhizomes and also with seeds. Can grow quite tall and horizontal root systems can be large. Disturbance. Positive potential productivity.
Cyperaceae	The sedges. Around 5,000 species, 110 genera. 1000s of species native to India, although no clear estimate is available.	Can be found in nearly all environments, but most are associated with wetlands. Another serious weed of rice, with <i>Cyperus iria</i> , <i>Cyperus difformis</i> , <i>Fimbristylis miliacea</i> and <i>Schoenoplectus juncoides</i> all native to India and listed under IRRI's dirty dozen (IRRI 2014).	Many sedges reproduce both vegetatively and with seeds. Some rely primarily on vegetative reproduction. Horizontal root systems can be very large. Seeds are often small (e.g. <i>Fimbristylis</i> sp.) but can be large (e.g. <i>Schoenoplectus</i> sp.). Those identified here were of an average size for sedges. Unclear

Table III: Gopalpur

Taxa	Notes	Ecology	Biological and Functional attributes
<i>Echinochloa</i> sp.	A genus of grasses which includes several millet crops. Around 35 species, including <i>E. frumentaceae</i> .	Several species are weeds of crops, including <i>E. colona</i> and <i>E. crus-galli</i> which are both members of IRRIs dirty dozen. <i>E. colona</i> is a mimic weed of rice which looks very similar during the vegetative stage. Generally prefer moist and wet fields. Some species can live in aquatic conditions.	Flowers throughout the year. Seeds have a short dormancy, but some plants can produce a large number of seeds (inc. <i>E. crus-galli</i> @ <40,000 a year). Can reproduce vegetatively. Some species produce many, large rhizomes. Plants are responsive to nutrients. Up to 1.5m tall. Disturbance. Positive potential productivity.
cf. <i>Eragrostis</i> sp.	A genus of grasses. 16 species listed in The Botany of Bihar and Odisha.	Several species are fairly common in South Asia. Many species can be found on wet ground or along the banks of rivers. Although some species are found on dry ground.	Plants reproduce by seed and rhizome. Horizontal root systems can be quite substantial. Plants tend to grow to around 60cm high. Unclear
<i>Ischaemum rugosum</i>		A serious weed of lowland rice, one of IRRIs dirty dozen.	Adapted to germinate after other weeds and so avoid early weeding. Aggressive growth, seeds germinate early in the wet season. Positive potential productivity.
Poaceae (small and large grass)	The grasses. The fifth largest plant family, over 10,000 species.	Poaceae are found in every environment, except the poles.	The family is too large and varied to describe functional attributes. Unclear

Table III cont.: Gopalpur

Taxa	Notes	Ecology	Biological and Functional attributes
cf. Aizoaceae	Stone plants. A family or around 135 genera.	Most endemic to arid and semi-arid areas. Many South Asian species are salt tolerant.	Unlikely to be a weed of rice.
Asteraceae	The daisies. Over 1,600 genera and 23,000 species. Includes the Chrysanthemums and Bidens.	Found in a variety of habitats, although mostly distributed within the temperate zone.	The family is too large and varied to describe functional attributes. Unclear
Boraginaceae	The borages Around 146 genera, 2000 species.	The family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
cf. Cyperaceae	The sedges. Around 5,000 species, 110 genera. 1000s of species native to India, although no clear estimate is available.	Can be found in nearly all environments, but most are associated with wetlands. Another serious weed of rice, with <i>Cyperus iria</i> , <i>Cyperus difformis</i> , <i>Fimbristylis miliacea</i> and <i>Schoenoplectus juncoides</i> all native to India and listed under IRRI's dirty dozen (IRRI 2014).	Many sedges reproduce both vegetatively and with seeds. Some rely primarily on vegetative reproduction. Horizontal root systems can be very large. Seeds are often small (e.g. <i>Fimbristylis</i> sp.) but can be large (e.g. <i>Schoenoplectus</i> sp.). Those identified here were of an average size for sedges. Unclear
Malvaceae	The mallows. Approximately 243 genera and 4000+ species including <i>Gossypium</i> , <i>Hibiscus</i> and <i>Sida</i> .	The family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
cf. <i>Mollugo</i> sp.	Carpet weed. Approximately 20 species.	A broadly distributed tropical and sub-tropical genus. Includes some weeds of cultivated land (e.g. <i>M. pentaphylla</i>). Some have seeds that are dispersed by water.	Species flower following monsoon rains in South Asia. Most can propagate vegetatively from stem fragments. Disturbance. Seasonal-following monsoon.
Rubiaceae	The bedstraw or madder family. Around 610 genera and 13000 species, including <i>Gardenia</i> and <i>Gallium</i> .	The family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear

Table IV: Kodumanal

Taxa	Notes	Ecology	Biological and Functional attributes
cf. <i>Stellaria</i> sp.	The chickweeds. Around 110 species.	The genera is distributed worldwide and in a variety of habitats within South Asia.	The genera is too large and varied to describe functional attributes. Unclear

Table IV: Kodumanal

Taxa	Notes	Ecology	Biological and Functional attributes
cf. Aizoaceae	Stone plants. A family or around 135 genera.	Most endemic to arid and semi-arid areas. Many South Asian species are salt tolerant.	Unlikely to be a weed of rice.
Chenopodioideae	A subfamily of Amaranthaceae. APRx. 26 genera, 486 species. Includes <i>Atriplex</i> sp., <i>Chenopodium</i> sp. and <i>Dysphania</i> sp.	This family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
Commelinaceae	The dayflowers. Around 40 genera, 650 species, including <i>Commelina benghalensis</i> and <i>Cyanotis</i> sp..	Distributed widely within the tropics and in a variety of habitats,	The family is too large and varied to describe functional attributes. Unclear
cf. Brassicaceae (Cruciferae)	The mustard family. Around 3,700 species within 330 genera. Includes <i>Brassica rapa</i>	This family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
cf. Cyperaceae	The sedges. Around 5,000 species, 110 genera. 1000s of species native to India, although no clear estimate is available.	Can be found in nearly all environments, but most are associated with wetlands. Another serious weed of rice, with <i>Cyperus iria</i> , <i>Cyperus difformis</i> , <i>Fimbristylis miliacea</i> and <i>Schoenoplectus juncoides</i> all native to India and listed under IRRI's dirty dozen (IRRI 2014).	Many sedges reproduce both vegetatively and with seeds. Some rely primarily on vegetative reproduction. Horizontal root systems can be very large. Seeds are often small (e.g. <i>Fimbristylis</i> sp.) but can be large (e.g. <i>Schoenoplectus</i> sp.). Those identified here were of an average size for sedges. Unclear
Euphorbiaceae	The spurge family, Approximately 300 genera and 7000 species. including <i>Ricinus communis</i> and <i>Euphorbia esula</i> .	Distributed widely within the tropics and in a variety of habitats,	The family is too large and varied to describe functional attributes. Unclear
<i>Ischaemum</i> sp.	Sometimes known as the murainagrasses. Around 80 species, including <i>I. rugosum</i> .	Found across South Asia and the Old World tropics in a variety of habitats. Includes a serious weed of rice and other species common to rice fields.	Many can reproduce vegetatively and via seed. Most show rapid growth and are very competitive on disturbed soils. Disturbance

Table V: Perur

Taxa	Notes	Ecology	Biological and Functional attributes
Malvaceae	The mallows. Approximately 243 genera and 4000+ species including <i>Gossypium</i> , <i>Hibiscus</i> and <i>Sida</i> .	The family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
<i>Verbascum scrophularifolium</i>	Unable to find this plant in any reference material.	The Verbascums are generally found on dry soils.	Unclear

Table V cont. : Perur

Taxa	Notes	Ecology	Biological and functional attributes
Amaranthaceae	The Amaranths. Approx. 145 genera (excluding Chenopodioideae), 2,000 species. Includes <i>Celosia argentea</i> and <i>Amaranthus spinosus</i> .	Some are herbs or shrubs, also includes vines and trees. Found in a wide variety of habitats.	The family is too large and varied to describe functional attributes. Unclear
Asteraceae	The daisies. Over 1,600 genera and 23,000 species. Includes the Chrysanthemums and Bidens.	Found in a variety of habitats, although mostly distributed within the temperate zone.	The family is too large and varied to describe functional attributes. Unclear
<i>Bulbostylis barbata</i>	Watergrass.	B. barbata frequent on sand dunes and sandy grounds near the sea shore. Also reported from riverbeds and woodland.	Unlikely to be a weed of arable land.
<i>Chenopodium</i> sp.	The goosefoots. Around 200 species, including <i>C. album</i> or ‘bathuwa’ cultivated in, but not native to, N India, and <i>C. giganteum</i> “tree spinach”.	A cosmopolitan genus. Tend to prefer rich soils.	Can grow up to 2m in height. Many species produce many seeds. The family is too large and varied to describe functional attributes. Unclear
Chenopodioideae	A subfamily of Amaranthaceae. APRx. 26 genera, 486 species. Includes <i>Atriplex</i> sp., <i>Chenopodium</i> sp. and <i>Dysphania</i> sp.	This family is distributed worldwide and in a variety of habitats within South Asia.	The family is too large and varied to describe functional attributes. Unclear
<i>Coix</i> sp.	Approx. 6 species, including 3 species, <i>C. lacryma-jobi</i> , <i>C. aquatic</i> and <i>C. puellarum</i> native to South Asia .	<i>C. aquatica</i> is an aquatic species, other species are found in dry-damp soils. All species prefer higher elevations c. 500m + and are rarely found in rice fields.	Unlikely to be a weed of arable land.

Table VI: Mantai

Taxa	Notes	Ecology	Biological and functional attributes
<i>Cyperus</i> sp.	The largest genera of sedges. Around 600 species worldwide, approx. 70 reported from India.	Largely adapted to wet lands, river banks and swamps. Common weeds of rice fields, both irrigated and rainfed.	Reproduces vegetatively from rhizomes and also with seeds. Can grow quite tall and horizontal root systems can be large. Disturbance. Positive potential productivity.
Cyperaceae	The sedges. Around 5,000 species, 110 genera. 1000s of species native to India, although no clear estimate is available.	Can be found in nearly all environments, but most are associated with wetlands. Another serious weed of rice, with <i>Cyperus iria</i> , <i>Cyperus difformis</i> , <i>Fimbristylis miliacea</i> and <i>Schoenoplectus juncoides</i> all native to India and listed under IRRI's dirty dozen (IRRI 2014).	Many sedges reproduce both vegetatively and with seeds. Some rely primarily on vegetative reproduction. Horizontal root systems can be very large. Seeds are often small (e.g. <i>Fimbristylis</i> sp.) but can be large (e.g. <i>Schoenoplectus</i> sp.). Those identified here were of an average size for sedges. Unclear
<i>Cyperus digitatus</i>	Finger flatsedge.	A widespread plant of swamps and seasonally flooded areas, though not common in rice fields.	Unlikely to be a weed of arable land.
<i>Cyperus</i> cf. <i>pumilis</i>	Low flatsedge.	Frequent in wetlands and may be found in rice fields.	A small sedge with a large, fibrous root system. Disturbance. Negative potential productivity?
cf. <i>Eleocharis</i> sp.	The spikerushes. A member of the sedge family. Around 250 species, including <i>E. dulcis</i> .	A cosmopolitan genus of aquatic or wet habitats. Many species are found in lowland tropical wetlands. Some species are relatively common weeds of rice.	Many species have rhizomes and reproduce vegetatively as well as through seed production. Unclear

Table VI cont. : Mantai

Taxa	Notes	Ecology	Biological and functional attributes
<i>Echinochloa</i> sp.	A genus of grasses which includes several millet crops. Around 35 species, including <i>E. frumentaceae</i> .	Several species are weeds of crops, including <i>E. colona</i> and <i>E. crus-galli</i> which are both members of IRRI's dirty dozen. <i>E. colona</i> is a mimic weed of rice which looks very similar during the vegetative stage. Generally prefer moist and wet fields. Some species can live in aquatic conditions.	Flowers throughout the year. Seeds have a short dormancy, but some plants can produce a large number of seeds (inc. <i>E. crus-galli</i> @ <40,000 a year). Can reproduce vegetatively. Some species produce many, large rhizomes. Plants are responsive to nutrients. Up to 1.5m tall. Disturbance. Positive potential productivity.
<i>Euphorbia esula</i>	Green spurge.	Prefers dry soils and full sunlight, but can grow in a variety of habitats.	Produces seeds with a good dormancy. Also reproduces vegetatively from a deep and spreading root system. Can grow fairly large (approx. 1m high), however the root system is often much more extensive. Disturbance
<i>Fimbristylis miliacea</i>	Grasslike simbry.	Common across South and Southeast Asia. A weed of rice, particularly rainfed rice. One of IRRI's dirty dozen.	Up to 50cm in height. Flowers year round and propagates by seed, producing around 10,000 seeds per year. Seeds can germinate immediately and plants reach maturity within 1 month. Disturbance
<i>Galium</i> sp.	The goosegrasses or bedstraws. One of the largest genera of flowering plants. Around 620 species.	Generally found in temperate habitats, cosmopolitan distribution. In South Asia species generally restricted to the Himalayan zone.	Unlikely to be a weed of arable land in Sri Lanka. Perhaps a weed of an imported wheat crop from North India?

Table VI cont. : Mantai

Taxa	Notes	Ecology	Biological and functional attributes
<i>Limnophila</i> sp.	Marshweeds. Approximately 40 species, including c. 10 native to Sri Lanka e.g. <i>L. aquatica</i> and <i>L. heterophylla</i> .	Listed South Asian species are aquatic or semi-aquatic and generally can be found in flooded rice fields, ponds or rivers. <i>L. heterophylla</i> considered a serious weed of deep-water rice in India.	Can propagate vegetatively from stem fragments, as well as through seed. Produces a large number of small seeds once a year. Short lived genus, flowers once a year following monsoon rains. Disturbance. Seasonality.
Poaceae (small grass)	The grasses. The fifth largest plant family, over 10,000 species.	Poaceae are found in every environment, except the poles.	The family is too large and varied to describe functional attributes. Unclear
<i>Rubus</i> sp.	A very large genus, including blackberries, raspberries and tayberries. 13 subgenera and perhaps up to 1000 species, however the literature is unclear.	The genera is distributed worldwide and in a variety of habitats within South Asia.	The genera is too large and varied to describe functional attributes. Unclear
<i>Stellaria</i> sp.	The chickweeds. Around 110 species.	The genera is distributed worldwide and in a variety of habitats within South Asia.	The genera is too large and varied to describe functional attributes. Unclear
<i>Stellaria media</i>	Chickweed.	A cosmopolitan species common to cultivated ground and areas of disturbance. Prefers moist, nitrogen rich soils.	In South Asia chickweed germinates and flowers all year round providing water is available. Can produce 20,000 seeds per plant. Seeds have a short dormancy. Plants are responsive to nutrient levels. Positive potential productivity.

Table VI cont. : Mantai

Taxa	Notes	Ecology	Biological and functional attributes
cf. <i>Solanum</i> sp.	Around 1,500 species, including <i>S. nigrum</i> and <i>S. dulcamara</i> .	The genera is distributed worldwide and in a variety of habitats within South Asia. <i>S. dulcamara</i> itself has been recorded in woodlands, marshes and dry scrubland.	The genera is too large and varied to describe functional attributes. Unclear
cf. Solanaceae	The nightshades. 115 genera, around 4,000 species.	The family is distributed worldwide and in a variety of habitats within South Asia.	This family is too large and varied to describe functional attributes. Unclear
<i>Trianthema</i> cf. <i>triquetra</i>	Black horse purslane or red spinach.	Found in arid regions. Sandy soils and semi-saline disturbed areas.	Unlikely to be an arable weed.

Table VI cont. : Mantai

Appendix X: SAabot.xls data for sites with rice and weeds. Weed taxa present at >10% of sites.
