

Lipid nanocapsules maintain full integrity after crossing a human intestinal epithelium model

Submitted by Jean-Christophe... on Tue, 03/07/2017 - 10:29

Titre	Lipid nanocapsules maintain full integrity after crossing a human intestinal epithelium model
Type de publication	Article de revue
Auteur	Roger, Emilie [1], Gimel, Jean-Christophe [2], Bensley, Conor [3], Klymchenko, Andrey S [4], Benoît, Jean-Pierre [5]
Editeur	Elsevier
Type	Article scientifique dans une revue à comité de lecture
Année	2017
Langue	Anglais
Pagination	11-18
Volume	253
Titre de la revue	Journal of Controlled Release
ISSN	0168-3659
Mots-clés	Caco-2 Intestinal transport [6], FRET [7], Integrity [8], Nanocapsules [9]
Résumé en anglais	Lipid nanocapsules (LNCs) have demonstrated great potential for the oral delivery of drugs having very limited oral bioavailability (BCS class II, III and IV molecules). It has been shown previously that orally-administered LNCs can permeate through mucus, increase drug absorption by the epithelial tissue, and finally, increase drug bioavailability. However, even if transport mechanisms through mucus and the intestinal barrier have already been clarified, the preservation of particle integrity is still not known. The aim of the present work is to study <i>in vitro</i> the fate of LNCs after their transportation across an intestinal epithelium model (Caco-2 cell model). For this, two complementary techniques were employed: Förster Resonance Energy Transfer (FRET) and Nanoparticle Tracking Analysis (NTA). Results showed, after 2 h, the presence of nanoparticles in the basolateral side of the cell layer and a measurable FRET signal. This provides very good evidence for the transcellular intact crossing of the nanocarriers.
