

# Reversible Guest Uptake/Release by Redox-Controlled Assembly/Disassembly of a Coordination Cage

Submitted by Sébastien Goeb on Wed, 12/14/2016 - 14:31

Titre	Reversible Guest Uptake/Release by Redox-Controlled Assembly/Disassembly of a Coordination Cage
Type de publication	Article de revue
Auteur	Croué, Vincent [1], Goeb, Sébastien [2], Szalóki, György [3], Allain, Magali [4], Sallé, Marc [5]
Pays	Allemagne
Editeur	Wiley
Ville	Weinheim
Type	Article scientifique dans une revue à comité de lecture
Année	2016
Langue	Anglais
Date	26 Janvier 2016
Numéro	5
Pagination	1746-1750
Volume	55
Titre de la revue	Angewandte Chemie International Edition
ISSN	1433-7851
Résumé en anglais	Controlling the guest expulsion process from a receptor is of critical importance in various fields. Several coordination-cages have been recently designed for this purpose, based on various types of stimuli to induce the guest release. Herein, we report the first example of a redox-triggered process from a coordination-cage. The latter integrates a cavity whose panels are based on the extended-tetrathiafulvalene unit. The unique combination of electronic and conformational features of this framework (i.e. high-p donating properties and drastic conformational changes upon oxidation) allows the reversible disassembling/reassembling of the redox-active cavity upon chemical oxidation/reduction respectively. This cage is able to bind the three-dimensional B <sub>12</sub> F <sub>12</sub> <sup>-</sup> anion in a 1:2 (host:guest) stoichiometry. The reversible redox-triggered disassembling of the cage could be also demonstrated in the case of the host-guest complex, offering a new option for guest delivering control.
