Abstract

Purpose of the paper: This study on consumer behaviour intends to combine two lines of investigation. First, we examine how different motivation factors in adventure tourism affect behavioural intentions. Secondly, in order to provide a better understanding of behavioural intentions we further explore the differences between the groups of individuals' subjective perception of risk.

Design/methodology/approach: A visitor survey was conducted on a sample of hard adventure tourists at the Friuli Dolomiti Alps Natural Park. Factor analysis of motivational items resulted in four dimensions (i.e. nature, risk, contemplation and socialization). In order to discover a relationship between the four motivational factors and the adventure tourists' behavioural intention, a stepwise regression analysis was conducted. Then, using ANOVA and post hoc analysis (Scheffe's test), the existing differences between various levels of risk perception of adventure tourists and their response to behavioural intentions were analysed.

Findings: The analysis of motivational factors indicates that "activity related motivations" include four dimensions: nature, risk, contemplation and socialization. The stepwise regression results show that nature is the only motivational factor that affects tourists' behavioural intention.

Originality/value: This paper shows that "nature" is the key motivational factor for adventure tourists to revisit a park.

Practical implications: The analysis provides a framework suggesting how organizations might usefully implement a marketing strategy. This study encompasses the risk perception as a motivational factor and tries to discuss how this concept can be operationalized in tourism marketing.

Limitations: This paper presents two main limitations. Firstly, the cross sectional nature of the data, and secondly, the hypotheses were tested using a sample from a limited area.

Key words: adventure tourism; perceived risk; behavioural models; natural parks

1. Introduction

Forms of nature based tourism, such as adventure tourism, are considerably increasing in many countries. In America and Europe,

¹ The paper is the result of the collaboration of the authors who are jointly responsible. The text is attributed as follows: paragraphs 1 and 5 to Andrea Moretti; paragraphs 2 and 4 to Michela C. Mason; paragraph 3 to Luca Gos.

adventure tourism accounts for \$263 billion with an estimated average yearly increase of 65% from 2009 to 2012 (Adventure Tourism Market Study, 2013).

In Italy adventure tourism is showing a significant growth, thanks to the heterogeneous and rich landscape, including both summer and winter sports and ranging from water to inland activities. According to this general tendency, in 2011 the Italian sector was estimated to have produced 6.3 Billion Euros (National Organisation responsible to measure Sport tourism, Borsa per il Turismo Sportivo, B.T.S.).

As adventure tourism continues to expand over the last years, scholars have increasingly attempted to understand the behaviour of this niche of tourism (Manning, 2011). Adventure tourism is a rather ambiguous and complex concept because of its latent, multidimensional and relative nature. It is characterized by elements of physical and psychological challenge, danger and risk, uncertain outcomes and exploration (Swarbroke *et al.*, 2003). A dependent or incidental relationship with the natural environment and a certain amount of skill and a physical exertion can be also considered as constitutive parts of adventure tourism (Lawton and Weaver, 2001). In this context, there is a need to further investigate some crucial aspects of adventure tourism, such as motivations and perceived risk of adventure recreationists, in order to properly define and meet the needs of this target audience.

In the last years, research has revealed that identifying tourist motivations is often the most constructive and effective way to determine appropriate visitor opportunities. Clarifying how these travel motivations influence tourists' behavioural intention, is fundamental for tourism planners and marketers (Beh and Bruyere, 2007; Li *et al.*, 2010). However, the decision-making process that leads to the consumers' evaluations, choices and behaviours is highly complex, and is also strongly influenced by risks perceptions (Campbell and Goodstein, 2001; Cho and Lee, 2006; Lin and Chen, 2009; Prayag and Jankee, 2013).

The present study focuses on the impact of motivations and risk perception in an adventure tourism setting, analysing specifically their relation with behavioural intention in a natural park. Although wildlife is the major attraction for tourists visiting national parks (Acquah *et al.*, 2015), in this particular setting a recreationist can be involved in recreational activities with inherent elements of physical, emotional or psychological risk, danger or uncertain outcomes, which typically take place within a natural environment (Ewert and Vernon, 2013).

Therefore, the aims of the present research are to extend the knowledge about hard adventure tourists in natural parks and assess their motivation, perceived risk and behavior. The purposes of the study can be summarized as follows: (a) to identify the motivational factors of Italian hard adventure tourists; (b) to explore the relationship between dimensions of motivation and behavioural intentions of Italian hard adventure tourists; (c) to classify different "types" of hard adventure tourists (based on their level of risk perceptions) in order to determine similarities and/or differences in term of their behavioural intentions.

This paper contributes to a theoretical understanding of adventure tourists in a natural park in two ways. It intends to determine the key motivational factors that are important for adventure tourists' decision to visit the park, and to analyse the relationship between these motivational factors and their behavioural intention. Secondly, it aims to test whether different levels of risk perceived by adventure tourists are related to their behavioural intentions or not. This relationship is important because unlike other consumption situations where higher risks deter consumers from repurchasing, in adventure tourism higher risks may be associated with more positive behavioural intentions (Prayag and Jankee, 2013). In addition, this study on consumer behaviour has also theoretical and practical value.

adventure tourism.
A natural park case study

2. Theoretical background

Adventure tourism -that is travelling to explore a “new experience, often involving perceived risk or controlled danger associated with personal challenges, in a natural environment or exotic settings” (Morrison and Sung, 2000, p. 11), has recently grown in popularity as a niche form of nature based tourism. It is characterized, as other nature based forms of tourism, by a dependent or incidental relationship with the natural environment. It should, however, be noted that adventure tourism is differentiated from other types of nature based tourism on the basis of the following three elements: 1) the element of risk in the tourism experience (Ewart, 1989; Hall, 1992; Fennell, 1999); 2) a higher level of physical exertion by the participant (Ewart, 1989); 3) the need for specialized skills to facilitate successful participation (Lawton *et al.*, 2001). Thus adventure tourism is “characterized by its ability to provide the tourist with relatively high levels of sensory stimulation, usually achieved by including physically challenging experiential components” (Muller and Cleaver, 2000, p. 156). Within this type of tourism, mountains, lakes, oceans and the most distant and wildest places represent “escape locations”, giving the tourist a feeling of adventure and risk perception as the below mentioned activities in table 1 (Pomfret, 2006).

Inside the macro-area of adventure tourism, it is possible to identify activities along a continuum ranging from “soft” to “hard” adventure wherein the levels of risk, skill and exertion increase from a minimum to a maximum level. Although highly subjective, this classification overlaps adventure tourism with other types of nature based tourism (e.g. ecotourism) in some soft adventure activities such as wildlife watching, safari and trekking (Lawton and Weaver, 2001). The category of “hard” or “pure” adventure activities includes activities of high personal risks and dangers and the production and the delivery of adrenaline activities (Kane and Tucker, 2004). They differentiate from all the others nature based activities by allowing practitioners to experience speed, high physical exertion or a combination of these factors, that result in a risk perception or in an adrenaline rush feeling for the tourist practicing them.

Tab. 1: Conventional and contemporary adventure tourism activities

Land based		Water based	Air based	Mixed (land/water/air)
Abseiling	Mountaineering ^a	Body boarding	Balloonng	Adventure racing
Backpacking ^a	Orienteering	Windsurfing	Bungee jumping	Charity challenges
Bicycling	Quad biking	Canyoning	Cliff jumping	Conservation expeditions
Caving	Scrambling	Cruise expeditions	Gliding	Cultural experiences
Climbing ^a	Skiing ^a	Kayaking	Hang-gliding	Gap year travel
Dog sledding	Snowboarding	Sailing	Micro-lighting	Hedonistic experiences
Hiking ^a	Snow mobiling	Scuba diving	Paragliding	Spiritual enlightenment
Hunting	Snow shoeing	Snorkeling	Parachuting	Wildlife watching
Horseback riding	Via Ferrata ^a	Surfing	Skydiving	
Safaris-Jungle exploring	Wilderness ^a experiences	Water skiing		
Motorcycling		White water rafting		
Mountain biking		Windsurfing		

^a Backpacking, climbing, hiking, mountaineering, skiing, via Ferrata and wilderness experiences are all mountaineering-related activities.

Source: Adapted from Pomfret, 2006.

Nowadays, existing empirical studies on motivations of adventure tourists seem to need more in-depth research in order to improve the identification of adventure tourists' motivations (Schneider and Vogt, 2012).

Motivation is "the process that accounts for an individual's intensity, direction, and persistence of effort toward attaining a goal" (Robbins, 2003, p. 155) or "the need that drives an individual to act in a certain way to achieve the desired satisfaction" (Beerli and Martin, 2004, p. 626). Another definition is the one proposed by Pizam, Neumann, Reichel, (1979), which refers to travel motivation as "the set of needs which predispose a person to participate in a touristic activity" (Pizam *et al.*, 1979, p. 195). As motivation can be defined the driving force behind all behaviours (Fodness, 1994; Gnoth 1997; Prebensen *et al.*, 2013), while research on motivation can be fundamental for understanding the reasons for participating in adventure tourism (Ross and Iso-Ahola, 1991).

Thus, motivation is a critical variable for explaining tourist behaviour. It has been employed as a fruitful criteria for segmentation in a large number of studies and in different settings including natural parks (e.g. Kerstetter *et al.*, 2004; Rid *et al.*, 2014; Tangeland *et al.*, 2013). Buckley presented a meta-analysis of adventure tourists' motivations for participating in tourism activities (Buckley, 2012). Some of these are known to be relaxation, to see different places, to discover new cultures, to swim, etc. Nearby them,

there are some other reasons like to feel rush, thrill or the enjoyment of risk. These latter elements can also be accepted as core ingredients of tourism for participants' motivation. Adventure by definition involves elements of risk that are extremely attractive to adventure tourists. We argue for the thesis that risk perception (Beck, 1992) is a combination of thrill and excitement. This definition comes very close to the concept of "rush" that is defined by Buckley as simultaneous experience of thrill and flow that is a more complex construct (Csikszentmihalyi, 1990). They are "associated with the successful performance of an adventure activity at a high level of skill" (Buckley, 2012, p. 963).

In tourism literature several studies indicate that motivation influence the following consumption behaviour such as behavioural intentions (Prayag and Grivel, 2013; Schofield and Thomson, 2007). Behavioural intentions have been defined as the "degree to which a person has formulated conscious plans to perform or not some specified future behaviours" (Warshaw and Davis, 1985, p. 214). Willingness to repurchase and recommending the tourism service to others are the two main elements that characterized behavioural intentions (Chi and Qu, 2008; Del Bosque and Martín, 2008; Ryu, Han, and Kim, 2008).

Following the approach of the behavioural model proposed by Needham and Rollins for nature based tourism (Needham and Rollins, 2009) deriving from the experience based management (Manfredo *et al.*, 1983) we postulate that adventure tourists are engaged in certain activities in a specific setting in order to fulfil their specific motivations and to realize benefits or outcomes (Acquah *et al.*, 2016). Thus, we investigate the relations between motivations and the response to them (i.e. behaviour) in a particular setting (i.e. a natural park) of tourism where particular activities (i.e. hard adventure activities) are practiced. Specifically, we analyse the risk perception as part of the key motivational factors in adventure tourism and how different levels of perceived risk are associated with the various high adventure tourism activities and their relation with the behavioural variables.

3. Methodology

Data collection was performed at the *Friuli Dolomiti Alps Natural Park* in spring 2014. This park is located in the western mountain zone dominating the upper plain of *Friuli Venezia Giulia* region (North East of Italy). The area extends over 36,900 hectares and it is characterized by the wilderness of its large valleys surrounded by the Dolomites. This is a protected area that extends in the Friuli-Venezia Giulia region, from the province of Pordenone to the province of Udine, including also Valcellina and the upper valley of river Tagliamento (see Figure 1). The area is characterized by a high degree of "wilderness", given by the absence of connecting roads. Among the captivating features of its landscape is the huge variety of plants and animals that enhances its attractiveness for outdoor enthusiasts.

For example, the morphology of the mountains of the area, the rains and the particular carbonate rocks such as limestone and dolomite, make the park attractive for canyoning and rafting.

Since adventure tourists seek recreation experiences that differ from those available through other outdoor activities (Berns and Simpson, 2009) the present paper in order to avoid overlapping with other tourism types (e.g. ecotourism) focuses on a sample of adventure tourists selected on the basis of their participation to hard adventure.

As showed in figure 1, nine hard adventure activities were chosen for the aim of the present research (i.e. Trekking; Wilderness hiking; Mountain climbing; Mountain biking; Rafting; Canyoning; Hang Gliding; Downhill bike and Orienteering).

Fig. 1: the study area

Legend	N°

Source: Authors' data and calculations

Self-administered questionnaires were used in this study. The core part of the questionnaire involved motivations for the hard adventure tourists' participation. A number of 317 tourists were randomly selected in the sample from a large population of hard adventure tourists of the Friuli Dolomiti Alps Natural Park. The sampling procedure was a systematic sampling, one every three hard adventure tourists (Mason and Moretti,

2015). This method selects elements from an ordered sampling frame; it is functionally similar to simple random sampling, because each element in the population has a known and equal probability of selection (Bowerman *et al.*, 2004). Nevertheless in the present paper hard adventure tourists were sampled in a specific context (i.e. a natural park), thus generalizability to larger settings can only be ensured on the basis of replication across different contexts, subjects, stimuli, and responses (Dipboye, 1990; Lynch, 1982). The sample size is in line with those used by other adventure tourism studies (e.g. Giddy and Webb, 2015). The researcher collected all data personally during holiday periods. The survey questionnaire consists of three parts: part 1 addresses motivations; part 2 deals with the perception of risk; part 3 deals with general characteristics (socio-demographics). All scale items were measured through a 7-point Likert scale ranging from Strongly Disagree (1) to Strongly Agree (7). The sample characteristics are summarized in Table 2. Data were analyzed through descriptive statistics (mean score and standard deviations), factor analysis, stepwise regression and ANOVA. Furthermore, a Scheffe post hoc procedure was carried out in order to determine whether the different levels of adventure tourists' risk perception differ or not in their response to the five behavioural variables.

4. Results

The general sociodemographic characteristics of tourists interviewed is presented in Table 2. The sample was equally distributed by gender (49.8% male and 50.2% women). Tourists were predominantly relatively young: 71.92% were between 19 and 29 years old, 0.63 % under 19, 8.2% between 30 and 39 years old, 8.83% between 40 and 49, 7.89% between 50 and 65 and only 2.53% around 65 or older. Tourists in the sample showed high levels of education on average, as 64.35% of respondents had a high school degree, 32.18% a college degree or higher and only 2.84% had a junior high school level of instruction.

Tab. 2: Sociodemographic profile of respondents

Socio-demographic variables of survey respondents (N=317)			
		Percentage	No.
	Gender		
Male		49.80%	158
Female		50.20%	159
	Age		
Less than 19		0.63%	2
19-29		71.92%	228
30-39		8.20%	26
40-49		8.83%	28
50-65		7.89%	25
65 and above		2.53%	8
	Educational level		
Primary school		0.63%	2
Junior high school		2.84%	9
Senior high school		64.35%	204
University or above		32.8%	102

The motivational items were defined according to the literature on leisure motivation and specifically to the Recreation Experience Preference (REP) scale that was developed within the experiential approach, to measure what motivates people to perform activities in natural areas (Manfredo *et al.*, 1996). Means and standard deviation of the items motivation were also reported to determine which of the motivations were the most important ones (table 3).

Tab. 3: Mean score and standard deviation of the motivation items

Motivation items	Source	Mean	Standard deviation
To enjoy natural resources	Kim <i>et al.</i> (2003)	5,47	1,608
Experience peace and quiet in nature	Tangeland <i>et al.</i> (2013)	5.15	1.587
To appreciate beautiful natural resources	Kim <i>et al.</i> (2003)	5.57	1.282
Experience fellowship whit nature	Tangeland <i>et al.</i> (2013)	5.30	1.381
Experience the landscape and moods of nature	Tangeland <i>et al.</i> (2013)	6.29	1.044
To be where things are natural	Manfredo <i>et al.</i> (1996)	5.34	1.462
To be close to nature	Manfredo <i>et al.</i> (1996)	6,17	1,006
To enjoy the natural scenery	Manfredo <i>et al.</i> (1996)	4.65	1.633
To enjoy fauna and flora	Tangeland <i>et al.</i> (2013)	5.29	1.549
To have thrills	Manfredo <i>et al.</i> (1996)	3.76	1.776
To experience excitement	Manfredo <i>et al.</i> (1996)	4.66	1.770
To experiance in the paced nature of things	Manfredo <i>et al.</i> (1996)	3.10	1.567
To feel exhilaration	Manfredo <i>et al.</i> (1996)	3.38	1.763
To take the risks	Manfredo <i>et al.</i> (1996)	4.94	1.569
To change dangerous situations	Manfredo <i>et al.</i> (1996)	5.90	1.192
To rest and relax	Beerli and Martin (2004)	3.77	1.683
To get away from the hustle and the bustle	Tangeland <i>et al.</i> (2013)	5.66	1.377
To change from daily routine	Tangeland <i>et al.</i> (2013)	3.93	1.581
To have time to think about life	Tangeland <i>et al.</i> (2013)	3.57	1.636
To find peace and quiet	Tangeland <i>et al.</i> (2013)	3.43	1.682
To get away from everyday life	Tangeland <i>et al.</i> (2013)	4.03	1.664
To have a time for natural study	Kim <i>et al.</i> (2003)	5.09	1.581
To have enjoyable time with family/friends	Kim <i>et al.</i> (2003)	5.17	1.437
To be with others who enjoy the same things you do	Manfredo <i>et al.</i> (1996)	5.09	1.429

Note: Individuals were asked to indicate their level of agreement on a 7-point Likert scale ranging from 1-strongly disagree to 7-strongly agree.

Source: Authors' data and calculations

To examine the dimensions underlying the motivation factors a principal component factor analysis with varimax rotation was undertaken. The 24 motivation factors items yielded four factors with eigenvalues greater than one (table 4). The first factor loaded on nine items and was called "Nature". The second factor was named "Risk Perception" and loaded heavily on six items. The third factor called "Contemplation" loaded on six items. The final factor labelled as "Socialization" loaded on three items. The Kaiser-Meyer-Olkin statistic that measures sampling adequacy for the motivation scales was 0.883. As shown in table 4 these four motivation dimensions accounted for 60.86% of explained variance.

Similar to other studies (e.g., see Saayman and Dieske, 2015; Buckely, 2012), nature, risk, contemplation and socialization emerged as the most relevant motivational factors to bring adventure tourists to protected areas.

Regarding behavioural intention, descriptive statistics were used to evaluate mean and standard deviation. Moreover, exploratory factor analysis, using principal component methods with varimax rotation, was used to summarize the five behavioural items in order to run the regression analysis. Table 5 and 6 provide statistics information, including the mean, standard deviation for the dependent variable behavioural intention as well as the results of the factor analysis.

Tab. 5: Mean scores, standard deviations and factor loading of the five intended behaviour variables

To identify which of the four tourists' motivation factors (predictive variables) is more related to respondents' behavioural intentions (dependent variable) we used a stepwise multiple linear regression. The stepwise regression starts with no candidate predictive variables in the model, testing the addition of each variable using the R-squared test, adding the variable that improves the model the most. After each step in which a variable is added, all candidate variables in the model are checked to see if their significance has been reduced below the tolerance level. If a no significant variable is found, it is removed from the model. Table 7 contains the results of the regression. As can be seen in the table only the motivation factor named "nature" contributed to the dependent variable, suggesting that this is the only factor ($\beta = 0.596$; $p < 0.001$)² to face adventure tourists' behavioural intention.

² Technically, p values cannot equal 0. Some statistical programs do give you p values of .000 in their output, but this is likely due to automatic rounding off or truncation to a preset number of digits after the decimal point. So, consider replacing "p = .000" with "p < .001," since the latter is considered more acceptable and does not substantially alter the importance of the p value reported. And p always lies between 0 and 1; it can never be negative.

Source: Authors' data and calculations

In a nutshell, it can be said that the “nature” motivation factor only had a significant relationship with behavioural intention. This seems to be partially in contrast with previous studies showing that, adventure tourists use outdoor natural environments as a setting for excitement-based recreation rather than appreciation of nature (e.g. Buckley, 2010). However, it must be pointed out that only few studies on adventure tourism have linked behaviour with nature and landscape elements, despite the most significant aspect of the tourism experience remaining the visual one (Giddy and Webb, 2015). In such perspective, adventure activities would not be considered as tourism without the unique location as its background (Urry and Larsen, 2011).

These findings call for a more in depth examination of risk perception, considered in literature as the key motivational factor for commercial participation in adventure tourism and specifically, its relationship with behavioural intention.

In table 8 descriptive statistics are provided simply as a way to characterize tourists’ risk perception related to their participation in the different “hard” adventure tourism activities that we have considered in the present study. The table shows a low discrepancy between the perception of risk and the objective risk that is related to each activity. Specifically, it appears that hang gliding was differentiated as the most risky activity followed by mountain climbing and canyoning. No big differences were observed for the other types of activities, although, on relative basis orienteering was ranked as the least risky activity and trekking as the second lowest one.

Tab. 8: Perceived level of risk for tourism activities

Perceived level of Risk for tourism activities	Mean	Standard Deviation
Trekking	1.85	1.37
Wilderness hiking	1.88	1.27
Mountain climbing	4.17	1.52
Mountain biking	2.89	1.40
Rafting	2.10	1.22
Canyoning	3.51	1.58
Hang Gliding	5.06	1.85
Downhill bike	2.16	1.28
Orienteering	1,30	1,01

Source: Authors' data and calculations

Regarding risk perception, the percentage of responses to the given seven-point Likert scale was grouped as “Low Risk” when the classification was 1 or 2 (N = 112), “Medium Risk”, when the classification was 3 or 4 (N = 119) and “High Risk”, for classifications from 5 to 7 (N = 85).

The results of ANOVA tests reveal that all five items contributed to differentiating the three risk perception clusters. In addition, the Scheffe post hoc tests were employed to examine any differences between clusters with respect to each of the factors. The results of the Scheffe tests show that statistically significant differences were found between clusters, thus supporting the fact that distinct clusters had indeed been identified (i.e. low risk perception, medium risk perception, high risk perception). The results are presented in table 9. The results show that a low risk perception seems to be associated to stronger tourists’ positive word of mouth and a stronger intention to revisit the park.

Since we are investigating hard adventure tourists who are involved in hard activities that require a high level of skill, personal competence and control in a given situation (i.e. high level of self-efficacy), we have to consider that their perceived self-efficacy influences the perceptions of circumstantial risk (Yates and Stone 1992; Bandura and Wood 1989). These subjects believe that they are very competent, they perceived more opportunities and fewer risks. Thus, these hard adventure tourists’ high levels of perceived self-efficacy can decrease the perceptions of circumstantial risk.

Tab. 9: ANOVA and post-hoc test

Behavioural Intention Items	Low Risk	Medium Risk	High Risk	F-ratio	Sig. Level
I would spread positive word-mouth about this park	5,99***	5,45***	5,88	7,89	0,000***
I will recommend this park to friends/ relatives	5,10*	4,59*	4,64	3,16	0,044*
I intend to revisit the park	5,84**	5,37**	5,64	4,94	0,008**
I desire to revisit the park	5,76**	5,28**	5,44	5,13	0,006**
If my friends were looking for a park to visit, I would tell them to try this park	5,73**	5,16**	5,08	6,68	0,001***

* p significant at 0.05 level; ** p significant at 0.01 level; *** p significant at <0.001 level.

5. Conclusions

This study on consumer behaviour examined a sample of Italian nature based tourists (i.e. hard adventure tourists) visiting a natural park. In Italy there is an admirable research on ecotourism (Anselmi, 2010; Galli and Notarianni, 2002; Montanari, 2009; Pencarelli and Splendiani, 2010), but there is still a lack of investigation on adventure tourism. The present contribution focuses on the analysis of three main aspects of adventure

tourism (i.e. motivations, perceived risk and behavioural intentions) to understand more about this phenomenon in Italy.

Effective marketing strategies for the promotion of adventure tourism settings (i.e. natural parks) are generally based on the analysis of tourists' motivations as driving forces in travel behaviours (Bradley *et al.*, 1997; Cini *et al.*, 2013; Raj, 2004; Um, Crompton, 1990). In line with this view, important findings from this study are discussed. First, the analysis of motivation factors in relation to participation of hard tourism adventure activities provides evidence that "activity related motivations" is a multi-dimensional phenomenon comprising four distinct motivational factors (i.e. Nature; Risk Perception; Contemplation and Socialization). Second, the findings do not completely support the proposition that adventure tourists use outdoor natural environments as a setting for excitement-based recreation rather than their appreciation of nature (like the recreationists). More specifically, the stepwise multiple linear regression results show only one positive significant relationship between motivational factor and tourists' behavioural intention, i.e. the "nature". Our results suggest there is a demand for high adventure activities focusing on "nature" themes. This finding appears in line with the "responsible" approach of nature-based tourism (of which adventure tourism can be considered a particular kind): in nature-based tourism, tourist motivations are increasingly concentrating around sensitivity for nature, and for local culture and landscape (Del Chiappa, Grappi, Romani, 2009). We showed that the natural environment is the key motivational factor in order to revisit the park and to spread a positive word of mouth. Hence, it is necessary to promote adventure tourism focused on the natural environment.

Finally, ANOVA analysis showed that the different levels of adventure tourists' risk perception differ in their response to the behavioural variables. More specifically, a low risk perception seems to be associated to stronger tourists' positive word of mouth and intention to revisit the park. Also, we found that tourists who express a low risk perception are associated to a stronger behavioural intention. Perception of risk is an important component in the tourists' behavior, but in hard adventure tourism activities, which involve high-risk and skills, our study pointed out that there is a statistically significant relationship between the level of risk perception (in particular low risk) and behavioral intention.

In addition, these findings offer several managerial implications for both private and public adventure tourism providers. An organization needs to evaluate the individual ability of adventure tourists in order to ensuring low risk perceptions instead of still retaining "the intense emotional component that comes from adventure" (Holyfield, 1999, p. 3). They need to specialize on one market of adventure tourism, such as beginners and advanced, and tailor their service in a tight integration of naturalistic fruition and adventure activities. In the Italian context these activities are mostly left to the free initiative of single individuals.

The development of synergies between the public and private sector can be powerful drivers for increasing adventure tourism potential. Many case studies concerning Italian tourist systems (e.g., Barile *et al.*, 2007; Della Lucia *et al.*, 2007; Silvestrelli and Bellagamba, 2007; Sciarelli *et al.*, 2007;

Motivations, perceived risk and behavioural intentions in hard adventure tourism.

A natural park case study

Della Corte *et al.*, 2007; Cerquetti, *et al.*, 2007, Rossi, *et al.*, 2007, Bonel *et al.*, 2005, Baccarani, *et al.*, 2007) have emphasized how systems (except for the Dolomiti case, and, to some extent, also Lake Garda) generally present competitive structural weaknesses, mainly related to the relationships between the private and public sector, and interfirm cooperation (Della Corte *et al.*, 2007). Moreover, risk-based adventure tourism provides bright potentials especially if it is centered on the correct use of natural resources.

It is worth to note that, all the activities that can be performed within a park must respect all its local characteristics (i.e. natural, anthropological, landscaping, historical, and cultural characteristics) in order to preserve the desired territorial identity (Menguzzato, 2013; Barile and Golinelli, 2008).

As with any study, this study has various limitations, which provide future research opportunities for others to explore the adventure tourists' behaviour. The study is limited to a specific Italian destination (i.e. a natural park) furthermore the analysis and the measure should be replicated in different contexts in order to test their adaptability to different adventure tourism destinations. Another important limitation is the cross-sectional nature of the data. Future research should explore these relationships over time.
