Abstract. The *Bolbelasmus* Boucomont, 1911 species of the western and southern regions of the Mediterranean Basin (Northern Africa, Iberian Peninsula and France) are revised. The following three new species are described: *Bolbelasmus brancoi* Hillert & Král sp. nov. and *Bolbelasmus howdeni* Hillert & Král sp. nov., both from Spain and Gibraltar, and *Bolbelasmus nikolajevi* Hillert, Arnone, Král & Massa sp. nov. from Egypt, Libya and Tunisia. *Bolbelasmus vaulogeri* (Abeille de Perrin, 1898) stat. restit. is removed from synonymy with *B. bocchus* (Erichson, 1841) and reinstated as a separate species. *Bolbelasmus romanorum* Arnone & Massa, 2010 is considered a junior subjective synonym of *B. vaulogeri*. Lectotypes for *Bolboceras bocchus* Erichson, 1841 and *Bolboceras vaulogeri* Abeille de Perrin, 1898 are designated. Relevant diagnostic characters (head, pronotum, elytron, external male genitalia) are illustrated. Identification keys for both males and females, and an annotated list of the Western Palaearctic representatives of the genus *Bolbelasmus* are presented. Finally, first records are given for *B. gallicus* (Mulsant, 1842) from Corsica and the Midi-Pyrénées region of France, *B. keithi* Miessen & Trichas, 2011 from the Greek island of Rhodes, and *B. unicornis* (Schrank von Paula, 1789) from the Tuscany province of Italy.

Key words. Coleoptera, Scarabaeoidea, Geotrupidae, Bolboceratinae, Bolbelasmini, *Bolbelasmus*, taxonomy, revision, new species, synonymy, species restitution, lectotype designation, key, distribution, annotated list, Mediterranean Region, Palaearctic Region

Introduction

The bolboceratine genus *Bolbelasmus* was erected by BOUCOMONT (1911) in his study 'Contribution à la classification des Geotrupidae', where he designated the following three species: *Bolboceras bocchus* Erichson, 1841, *Bolboceras gallicus* Mulsant, 1842 and *Bolboceras unicornis* (Schränk von Paula, 1789) as 'species typicae'. In the same study, BOUCOMONT (1911) erected the genus *Kolbeus* with 'species typicae' *Bolboceras arcuatum* Bates, 1887 and *Bolboceras coreanum* Kolbe, 1886. Type species were designated by LUCAS (1920) for *Kolbeus*, namely *Bolboceras coreanus*, while 30 years later, CARTWRIGHT (1953) designated *Bolboceras gallicus* for *Bolbelasmus*. In addition, CARTWRIGHT (1953) synonymized *Kolbeus* under *Bolbelasmus* in the same article. In a recent taxonomic study, NIKOLAJEV (1996) described the tribe Bolbelasmini with three genera: *Bolbelasmus* Boucomont, 1911, *Bolbotrypes* Olsoufieff, 1907 and *Bolbogonium* Boucomont, 1911. Later on NIKOLAJEV (2003) placed *Kolbeus* at the rank of subgenus of *Bolbelasmus*. SCHOLTZ & BROWN (1996) have proposed that the group of genera related to *Bolboceras* Kirby, 1819 belongs to the rank of family (Bolboceratidae). However, in accordance with recent studies based on molecular data (e.g. SMITH et al. 2006) and with phylogeny of the Geotrupidae based on larval morphology (VERDÚ et al. 2004), the group is treated as a subfamily of Geotrupidae in this study (see also BOUCHARD et al. 2011).

Currently, we recognize 27 species of the genus *Bolbelasmus* (including subgenus *Kolbeus*) from the Holarctic Region, including three new species described in this study. Eight taxa are distributed throughout the New World, eleven are known from Europe and the Mediterranean Region and eight are native to the Himalaya, Far East, China and south-eastern Asia (e.g. REITTER 1895, HOWDEN 1964, PETROVITZ 1968, KRIKKEN 1977, MASUMOTO 1984, HOWDEN & SOLIS 1995, NIKOLAJEV 2005, KRÁL et al. 2006, LI et al. 2008). According to KRIKKEN (1977), ARNONE & MASSA (2010), MIESSEN (2011) and MIESSEN & TRICHAS (2011) and to the results of the present study, eleven species of the genus *Bolbelasmus* are distributed in Europe, Middle East and North Africa.

The new species in this genus were described thanks to the study of a large number of specimens from almost 70 institutional and private collections and series of specimens recently collected by the authors.

Material and methods

The habitus photographs were either taken by D. Král using a Canon MP-E 65mm/2.8 Macro lens with 5:1 optical magnification on bellows attached to a Canon EOS 550D camera or by M. Romano using a Canon EOS 450D digital camera mounting a Sigma 70 mm 1:2.8 DG macro. Partially focused images of the specimen were stacked using Helicon Focus 3.20.2 Pro software.

The following codes identify the collections housing the material examined (curators in round brackets):

Altogether, 1332 specimens (see material below) were studied. Specimens of the newly described species are provided with one red printed label ‘Name of taxon sp. nov., HOLO-TYPUS ♂, ALLOTYPUS ♀ or PARATYPUS ♂ or ♀ followed by the name of the authors and the year’. In the case of lectotype or paralectotype designation, each specimen bears a red printed label: ‘Name of a taxon with author and year of original description, LECTOTYPUS ♂ or PARALECTOTYPUS ♂ or ♀ David Král & Oliver Hillert des. 2014’. Remarks of the authors and comments are indicated in brackets. Exact label data are cited for the type material. Information in quotation marks (‘’) indicates the original spelling. Coordinates and altitude are assigned to each locality mentioned in the text (material examined in each species) (see Appendix 1). These data were used in the construction of distribution map (see Fig. 59).

Taxonomy

Bolbelasmus bocchus (Erichson, 1841)

(Figs 1, 8, 14, 21, 27, 33, 39, 45–51, 59–60)

Bolbocerus Bocchus Erichson, 1841: 170 (original description). GORY (1841): table 71, figs 1, 1A (list); MARSEUL (1857): 83 (list); JACQUELIN DU VAL (1863): 434 (catalogue); BOUCOMONT (1902): 4 (catalogue); HEYDEN et al. (1906): 725 (catalogue); WINKLER (1927): 1035 (catalogue).

Bolbelasmus bocchus: BOUCOMONT (1912): 17 (catalogue); WINKLER (1927): 1035 (catalogue); KOCHER (1958): 77 (catalogue); RUIZ (2000): 84 (distribution).

Bolbelasmus bocchus [partim, populations from Morocco]: BARAUD (1977): 160 (monograph); MARTÍN-PIERA & LÓPEZ-COLÓN (2000): 179 (monograph).

Bolbelasmus bocchus bocchus [partim, populations from Morocco]: KRICKEN (1977): 290, figs 16–17 (revision); BARAUD (1985): 53, fig. 8 (monograph); BARAUD (1992): 44 (monograph); KRÁL et al. (2006): 82 (catalogue).

Bolboceras Fissicornis Mulsant, 1843: 280 (original description). Type locality: ‘Algérie’. MARSEUL (1857): 83 (synonymy).

Type locality. ‘Algier, [Bona = Annaba]’ (see Type material for details).

Type material examined (3 specimens). **ALGERIA:** LECTOTYPE (present designation): ♂ (MNHB), ‘Hist. – coll. (Coleoptera), Nr. 25569, Bolboceras Bocchus Er. – Kl., Bona, Wagner, Zool. Mus. Berlin, Syntypus, Bolbelasmus

bocchus Erichson, 1841, labelled by MNHUB 2013'. **PARALECTOTYPES:** No. 1, ♀ (MNHB), 'Hist. – coll. (Coleoptera), Nr. 25569, Bolboceras Bocchus Er. – Kl., Bona, Wagner, Zool. Mus. Berlin, Syntypus, Bolbelasmus bocchus Erichson, 1841, labelled by MNHUB 2013'; No. 2, ♂ (MNHB), 'Hist. – coll. (Coleoptera), Nr. 25569, Bolboceras Bocchus Er. – Kl., Bona, Wagner, Zool. Mus. Berlin, Syntypus, Bolbelasmus bocchus Erichson, 184, labelled by MNHUB 2013'; see Figs 45–51.

Additional material examined (183 specimens). **ALGERIA:** Algeria, 2 ♂♂ 1 ♀ (SMTD), 1 ♀ (MNHN), 2 ♂♂ 2 ♀♀ (BMNH); Algerie, 1 ♂ 2 ♀♀ (MHNL); Algerien, 3 ♂♂ (SMTD). **ALGIERS PROV.:** Alger (city), vi.1996, 1 ♂ (DKCP); Alger, 1 ♂ (MNHN); Algier, 2 ♂♂ (MNHB); L. (MNHN); Daja, 1 ♀ (MNHN).

Redescription. Male (lectotype) (Figs 45–47). Remarkably convex, hemispherical; dorsal surface brownish, remarkably shiny.

Head (Figs 45–47). Clypeus broadly rounded, almost semicircular, anterior angles vague, posterior angles elevated. Frontal horn well developed, long, distinctly furcate apically; its base outline elliptic in dorsal aspect, posterior edge of base situated at level of anterior part of eye; lateral margin of horn distinctly, sharply keeled from base to middle of tubercle. Clypeal disc with simple, coarse punctation. Oblique keels above eyes reaching approximately to half of eyes. Punctation of frons and vertex approximately same as on clypeus. Fronto-clypeal suture present. Eyes well developed, distinctly elliptic; genae exceeding eyes, arcuate posteriorly.

Pronotum (Figs 45–47) distinctly transverse, broadest just in basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea nearly missing. Pronotal punctation distinct, double, consisting of coarse, deeply impressed punctures, punctures separated by approximately 2–3 times their diameter and intermixed with very fine ones. Pronotal base glabrous; lateral hornlike apophyses well developed, directed forwardly in dorso-lateral view; cavity between lateral and apical apophyses remarkably deep, kidney-shaped. Apical hornlike apophysis well developed, distinctly elevated, angled, directed upwards, subapical protrusion situated on outer side, basally.

Scutellar shield elongate triangular, very finely punctate, shiny.

Elytra approximately as long as wide, surface shiny; humeral umbone weak; between humerus and elytral suture seven distinctly impressed striae along entire elytral length, striae with coarse, regularly spaced punctures; intervals flat, impunctate.

Aedeagus. Parameres as in Fig. 60.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female (Paralectotype No. 1). Head (Fig. 48). Clypeus broadly rounded, semicircular with straight anterior margin, anterior angles evenly rounded. Posterior angles of clypeal margin very weakly elevated. Frontal carina well developed, distinctly interrupted at middle, bituberculate at internal interruption, keeled laterally. Punctation of clypeus, frons, vertex and occiput simple, distinct; oblique keel above eyes distinct, extended to half of eyes; eyes well developed, distinctly elliptic, genae well developed, regularly arcuate.

Pronotum (Fig. 48) distinctly transverse, lateral margin weakly widened, broadest just at base, surface distinctly and deeply punctate, punctation double except impunctate base, punctures separated by distance equal to their diameter and intermixed with very fine ones. Anterior protrusion distinctly transverse, sharply semicircular, lateral apophyses present.

Measurements. Total body length 11.0–14.8 mm (lectotype, ♂: 13.5 mm; paralectotype No.1, ♀: 14.0 mm).

Differential diagnosis. Refer to species key.

Collecting circumstances. Prefers calcareous soils.

Distribution. Mediterranean parts of Algeria and northern Morocco (Fig. 59).

Remarks. The type locality of *B. bocchus* is ‘Algier’, the species has been recorded also from Spain (not Portugal: BRANCO 2005), northern Algeria and northern Morocco (cf. e.g. KRICKEN 1977; BARAUD 1977, 1985, 1992; KRÁL et al. 2006; MARTÍN-PIERA & LÓPEZ-COLÓN 2000; RUIZ 2000). Regarding the presence in Spain, we consider the Iberian populations to belong to another species, described in this paper as *B. brancoi* sp. nov. The populations distributed in northern Tunisia and probably also in eastern parts of Algeria were at first referred to another species, *Bolbelasmus vaulogeri*, later synonymized with *B. bocchus* by BOUCOMONT (1911) and considered a subspecies of *B. bocchus* by KRICKEN (1977). We consider these populations to represent a valid species and identical to populations of Sicily described recently as *B. romanorum* Arnone & Massa, 2010 (syn. nov.). We also consider the populations native to Middle and South Tunisia, Libya (Tripolitania, Cyrenaica) (SCHATZMAYR 1946) and Egypt (Mariout) (PIC 1924) to be a distinct species, *B. nikolajevi* sp. nov., described in this paper.

Finally, CHIKATUNOV & PAVLÍČEK (1997) reported *B. bocchus* from Israel, but we did not have the opportunity to study any *Bolbelasmus* material from the Levant countries. ERICHSON (1841) described *Bolboceras bocchus* based on a series of unknown number of specimens. He did not establish a type; thus in this study, we designated a lectotype (♂) (Figs 45–47, 49) and two paralectotypes for fixation of this taxon (Figs 48, 50–51). *Bolboceras fissicornis* Mulsant, 1843 was also described from ‘Algéria’ based on the same morphological characters of *B. bocchus* (‘tête armée d’une corne non mobile, bifide au sommet [= head armed with immobile horn, furcate apically]’) (MULSANT 1843) and later synonymized with *B. bocchus* by MARSEUL (1857). This important character of *B. bocchus* is shown also in GORY (1841: table 71, figs 1, 1A).

Bolbelasmus brancoi Hillert & Král sp. nov.

(Figs 2, 9, 15, 22, 28, 34, 40, 59, 61)

Description. Male (holotype). Remarkably convex, surface black, shiny, pronotum covered with double punctation, elytra microsculptured to smooth apically.

Head (Figs 2, 15, 22, 28, 34). Clypeus broadly rounded, almost semicircular, anterior angles vague, posterior angles elevated. Frontal horn well developed, short, distinctly furcate apically; base weakly keeled on each side of anterior part of eyes. Clypeal disc with simple, coarse punctation. Oblique keels above eyes reaching approximately to eyes. Punctuation of frons and vertex approximately same as on clypeus. Fronto-clypeal suture present. Eyes well developed, distinctly elliptic; genae extending eyes, arcuate posteriorly. Pronotum (Figs 2, 15, 22, 28) distinctly transverse; broadest just in basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctation distinct, double, consisting of well and deeply impressed punctures with exception of basal part; punctures separated approximately by distance equal to their diameter, intermixed with very fine ones. Lateral hornlike apophyses well developed, remarkably cone-shaped, bent up and directed to sides. Apical hornlike apophysis distinct, but only weakly elevated, obtuse-angled, directed 30° frontoapically.

Scutellar shield triangular, weakly longer than wide, microsculptured, alutaceous.

Elytra approximately as long as wide, surface shiny, microsculptured, microsculpture vanishing apically; humeral umbone weak, between suture and humerus seven distinct striae along entire elytral length, all striae with distinctly confluent punctures; intervals convex.

Parameres as in Fig. 61.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female (allotype). Head (Figs 9, 40). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin very weakly elevated. Frontal carina well developed, distinctly interrupted in middle, bituberculate on internal interruption. Punctuation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, extended to half of eyes; eye well developed, distinctly elliptic, genae well developed, arcuate anteriorly and posteriorly.

Pronotum (Fig. 9) distinctly transverse, lateral margin weakly widened, broadest just basally, surface distinctly deeply punctate, doubly except basally, punctures consisting of well and deeply impressed punctures, separated approximately by distance equal to their diameter, intermixed with very fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, lateral apophyses present.

Elytron surface shiny, microsculptured, microsculpture vanishing to apex; humeral umbone weak.

Measurements. Total body length 11.2–15.1 mm (holotype, ♂: 14.8 mm; allotype, ♀: 14.9 mm).

Differential diagnosis. Refer to species key.

Etymology. Patronymic; named in honour of our colleague Tristão Branco (Porto, Portugal), an excellent specialist in Scarabaeoidea.

Collecting circumstances. Prefers calcareous soils.

Distribution. North-eastern, Central and South-eastern parts of Spain (Fig. 59).

Remarks. The historical faunal conception of *B. bocchus* based on MARSEUL (1857) and JACQUELIN DU VAL (1863) was inaccurate, and for 150 years, the distribution area of this species was reported incorrectly. The first theoretical analysis of this situation was published by BRANCO (2005). In the present study, we confirm, in all details, and follow Branco's analysis. The Spanish specimens show distinct differences in morphological characters, as described in the identification key.

Bolbelasmus gallicus (Mulsant, 1842)

No further locality specified: Espagne, 1 ♂ (NMPC); Hisp[ania], 1 ♂ (NMPC); Spanien, 1 ♂ (SMTD).

Redescription. Distinctly convex, surface black, shiny, pronotum covered with double punctation, elytra glabrous.

Male. Head (Figs 3, 16, 23, 29, 35). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin not elevated. Frontal horn well developed, long, conical, apex widened, triangular in frontal view, base conical, not keeled, apex simple, unmodified. Punctuation of clypeal disc simple, distinct. Oblique keels above eyes approximately reaching eyes. Punctuation of frons and vertex same as the one on clypeus; fronto-clypeal suture present. Eyes distinctly elliptic, well developed; genae evenly rounded, semicircular.

Pronotum (Figs 3, 16, 23, 29) distinctly transverse; broadest just in basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctation distinct and double, consisting from well and deeply impressed punctures, except on basal part; punctures separated approximately by distance equal to their diameter, intermixed with very fine pinned punctures. Lateral hornlike apophyses well developed, conical, bent upwards and sideways. Apical hornlike apophyses distinct but weakly elevated, obtuse-angled, directed 30° frontoapically. Both apical hornlike apophyses joined in keel.

Scutellar shield triangular, as long as wide, shiny, densely punctate.

Elytra approximately as long as wide, surface shiny, not punctate; humeral umbone weak; between suture and humerus seven distinct striae along entire elytral length, all striae with confluent punctures; intervals convex.

Parameres as in Fig. 62.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female. Head (Figs 10, 41). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin not elevated. Frontal carina well developed, not interrupted in middle, doubly s-shaped. Punctuation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, elongated to base of eyes; eyes well developed, distinctly elliptic, genae well developed, arcuate anteriorly.

Pronotum (Fig. 10) distinctly transverse, lateral margin weakly widened, broadest just basally, surface distinctly deeply punctate, punctuation double except for base, punctures consisting of well and deeply impressed punctures, separated approximately by distance equal to their diameter, intermixed with very fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, lateral apophyses present.

Elytron surface shiny, glabrous; humeral umbone weak.

Measurements. Total body length 11.0–14.6 mm.

Differential diagnosis. Refer to species key.

Collecting circumstances. Prefers sandy soils.

Distribution. Southern and south-western France, Portugal, North-western and Central Spain (Fig. 59). We provide first records from Corsica and the Midi-Pyrénées Region of France.

Description. Male (holotype). Distinctly convex, surface black, shiny, pronotum covered with double punctuation, elytra glabrous.

Head (Figs 4, 17, 24, 30, 36). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin not elevated. Frontal horn well developed, long, base conical, not keeled, apex simple, unmodified. Punctuation of clypeal disc simple, distinct. Oblique keels above eyes approximately reaching eyes. Punctuation of frons and vertex same as on clypeus; fronto-clypeal suture present. Eyes distinctly elliptic and well developed; genae evenly rounded, semicircular.

Pronotum (Figs 4, 17, 24, 30) distinctly transverse; broadest just in basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctuation distinct, double, consisting of well and deeply impressed punctures except for basal part, punctures separated approximately by distance equal to their diameter, intermixed with very fine, pinned punctures. Lateral hornlike apophyses well developed, conical, bent up and sideways. Apical hornlike apophyses distinct but weakly elevated, obtuse angled, directed 45° frontoapically. Both apical hornlike apophyses joined together in keel-like seam.

Scutellar shield triangular, approximately as long as wide, shiny, densely punctate.

Elytra approximately as long as wide, surface shiny, glabrous; humeral umbone weak; between suture and humerus seven distinct striae along entire elytral length, all striae with confluent punctures; intervals convex.

Parameres as in Fig. 63.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female (allotype). Head (Figs 11, 42). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin not elevated. Frontal carina well developed, not interrupted in middle, doubly s-shaped. Punctuation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, elongated to base of eyes; eye well developed, distinctly elliptic, genae well developed, arcuate anteriorly.

Pronotum (Fig. 11) distinctly transverse, lateral margin weakly widened, broadest just basally, surface distinctly deeply punctate, doubly except for basal part, punctures consisting of well and deeply impressed punctures, separated approximately by distance equal to their diameter, intermixed with very fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, lateral apophyses present.

Elytron surface shiny, glabrous; humeral umbone weak.

Measurements. Total body length 11.3–15.2 mm (holotype, ♂: 14.6 mm; allotype, ♀: 15 mm).

Differential diagnosis. Refer to species key.

Etymology. Patronymic; named in honour of our friend, the late Henry F. Howden (Ottawa, Canada), a renowned specialist in world Scarabaeoidea.

Collection circumstances. Prefers sandy soils.

Distribution. South-eastern parts of Spain and Gibraltar (Fig. 59).

Description. Male (holotype). Distinctly convex, surface brownish or light-brown, shiny, pronotum covered with double punctation, elytron very fine microsculptured basally, microsculpture missing apically.

Head (Figs 5, 18, 25, 31, 37, 57). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin elevated. Frontal horn well developed, long, distinctly furcate, base triangularly shaped in dorsal view, posterior edge of base situated at height of center of eye, side margin of tubercle keeled from base to apex. Punctation of clypeal disc simple, distinct. Oblique keels above eyes reaching approximately to half of eyes. Punctation of frons and vertex same as on clypeus; frontoclypeal suture present. Eyes distinctly elliptic and well developed; genae arcuate posteriorly, extending eyes laterally.

Pronotum (Figs 5, 18, 25, 31, 37, 57) distinctly transverse; broadest just in basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctation distinct, double, consisting of deeply impressed punctures, punctures separated by approximately 2–3 times their diameter, intermixed with very fine, pinned punctures. Base of pronotum glabrous. Lateral hornlike apophyses well developed, bent distinctly upwards and sideways in lateral and dorsal view; between lateral and apical apophyses distinct, deeply oval concavity. Apical hornlike apophyses distinctly elevated, angled, directed 30° frontoapically, subapical protrusion of apical apophyses laterally near apex on outside.

Scutellar shield triangular elongate, very finely punctate, shiny.

Elytra approximately as long as wide, surface shiny, glabrous; between suture and humerus 7 distinct striae along entire elytral length, all striae with distinctly separated punctures; intervals flat; humeral umbone weak.

Parameres as in Fig. 64.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female (allotype). Head (Figs 12, 43). Clypeus broadly rounded, semicircular with straight anterior margin, anterior angles evenly rounded. Posterior angles of clypeal margin very weakly elevated. Frontal carina well developed, distinctly interrupted in middle, bituberculate on internal interruption, laterally keeled on each side. Punctation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, elongated to half of eyes; eye well developed, distinctly elliptic, genae well developed, arcuate anteriorly and posteriorly.

Pronotum (Fig. 12) distinctly transverse, lateral margin weakly widened, broadest just basally, surface distinctly deeply punctate, double except of basal part, punctures consisting of well and deeply impressed punctures, separated approximately by distance equal to their diameter, intermixed with very fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, lateral apophyses present.

Elytron surface shiny, glabrous; humeral umbone weak.

Measurements. Total body length 12.0–15.1 mm (holotype, ♂: 14.6 mm; allotype, ♀: 14.8 mm).

Differential diagnosis. Refer to species key.

Etymology. Patronymic; named in honour of our friend Georgy V. Nikolajev (Al-Farabi State University, Almaty, Kazakhstan), a renowned specialist in world Scarabaeoidea.

Collection circumstances. Prefers sandy and/or loess soils.

Distribution. Mediterranean Egypt, Libya (Tripolitania, Cyrenaica) and Tunisia (Fig. 59).

***Bolbelasmus vauloegeri* (Abeille de Perrin, 1898) stat. restit.**

Figs 52–56. Lectotype and labels of *Bolbelasmus vaulogeri* (Abeille de Perrin, 1898), male, deposited in MNHN. 52 – habitus in dorsal aspect, 53 – same but frontal aspect, 54 – same but lateral aspect, 55 – labels of lectotype, 56 – labels of paralectotype No 1.

Figs 57–58. Living specimens. 57 – *Bolbelasmus nikolajevi* Hillert, Arnone, Král & Massa sp. nov. (paratype, ♂, Tunisia, Cap Bon peninsula, 6 km W of El Hawariah); 58 – *B. vaulogeri* (Abeille de Perrin, 1898) (♂, Tunisia, Cap Bon peninsula, 2 km NW of Douela). Photos by Petr Šípek.

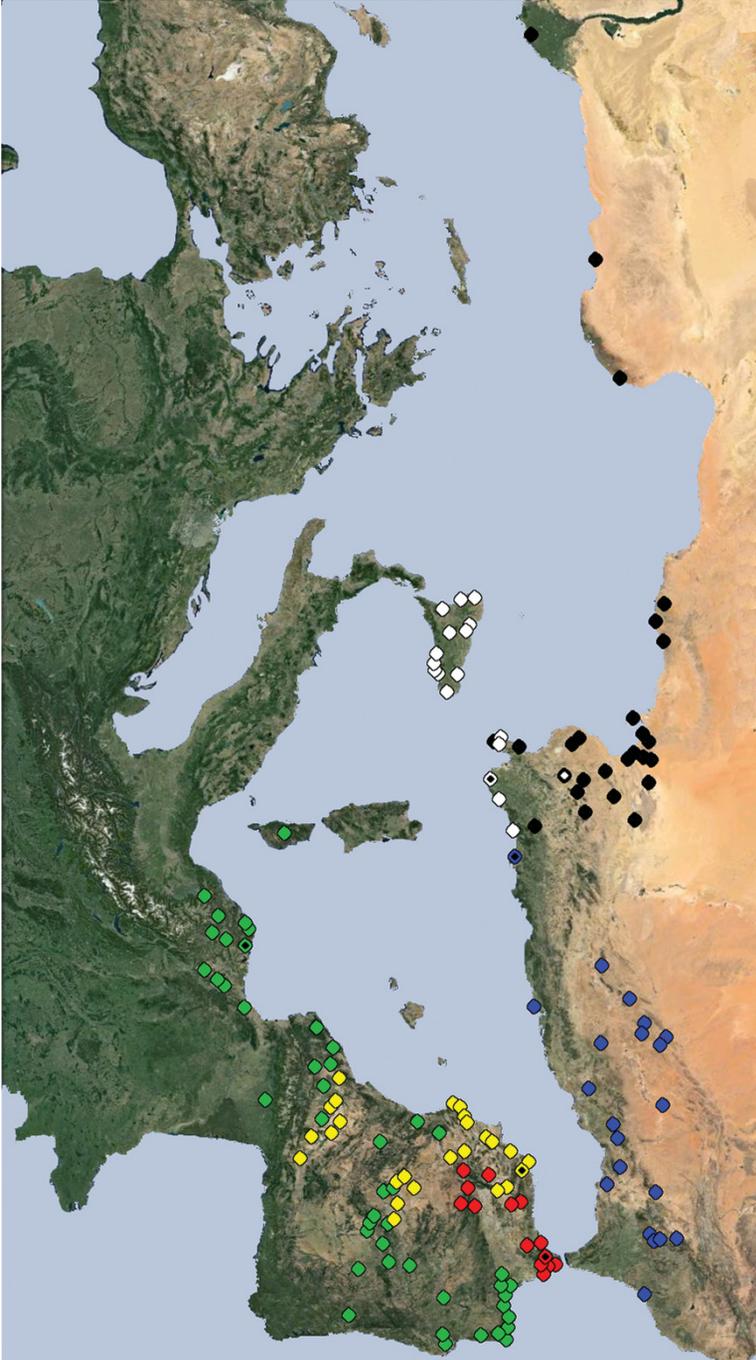

Fig. 59. Map of the Mediterranean with known distribution of *Bolbelasmus* species discussed. *B. bocchus* (Erichson, 1841) – blue, black centre = type locality; *B. brancoi* Hillert & Král sp. nov. – yellow, black centre = type locality; *B. gallicus* (Mulsant, 1842) – green, black centre = type locality; *B. howlandi* Hillert & Král sp. nov. – red, black centre = type locality; *B. nikolajevi* Hillert, Arnone, Král & Massa sp. nov. – black, white centre = type locality; *B. vaulogeti* (Abeille de Perrin, 1898) – white, black centre = type locality.

Head (Figs 52–54). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin elevated. Frontal horn weakly developed, short, simple, conical. Punctuation of clypeal disc simple, distinct. Oblique keels above eyes reaching to approximately posterior part of eyes. Punctuation of front and vertex same as on clypeus; fronto-clypeal suture present. Eyes weakly elliptic and well developed; genae evenly rounded, distinctly extending eyes laterally.

Pronotum (Figs 52–54) distinctly transverse; broadest just at basal quarter, entirely bordered; lateral margin evenly rounded, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctuation distinct, double, consisting of well and deeply impressed punctures, separated by less than their diameter, intermixed with very fine, pinned punctures. Lateral hornlike apophyses weakly tuberculate. Apical hornlike apophyses weakly elevated, joined in keel-like seam.

Scutellar shield triangular, finely punctate, shiny.

Elytra approximately as long as wide, surface shiny, glabrous; between suture and humerus 7 distinct striae along entire elytral length, all striae with distinctly confluent punctures; intervals convex; humeral umbone weak.

Aedeagus. Parameres as in Fig. 65.

Variability in males. Surface black to brownish; pronotal hornlike apophyses in medium developed and underdeveloped (hypothelic) specimens short, more or less straight, only simply rounded to almost acute apically.

Female (Paralectotype No. 1). Head: Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin very weakly elevated. Frontal carina well developed, not interrupted, in middle and on each side tuberculate. Punctuation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, elongated to posterior part of eyes; eyes well developed, nearly rounded, genae well developed, evenly rounded and distinct, extending eyes laterally.

Pronotum distinctly transverse, lateral margin weakly widened, broadest just basally, surface distinctly deeply punctate, doubly except of basal part, punctures consisting of well and deeply impressed punctures, separated by less than their diameter, intermixed with very fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, in middle emarginated, lateral apophyses present, but almost invisible.

Elytron surface shiny, glabrous; humeral umbone weak.

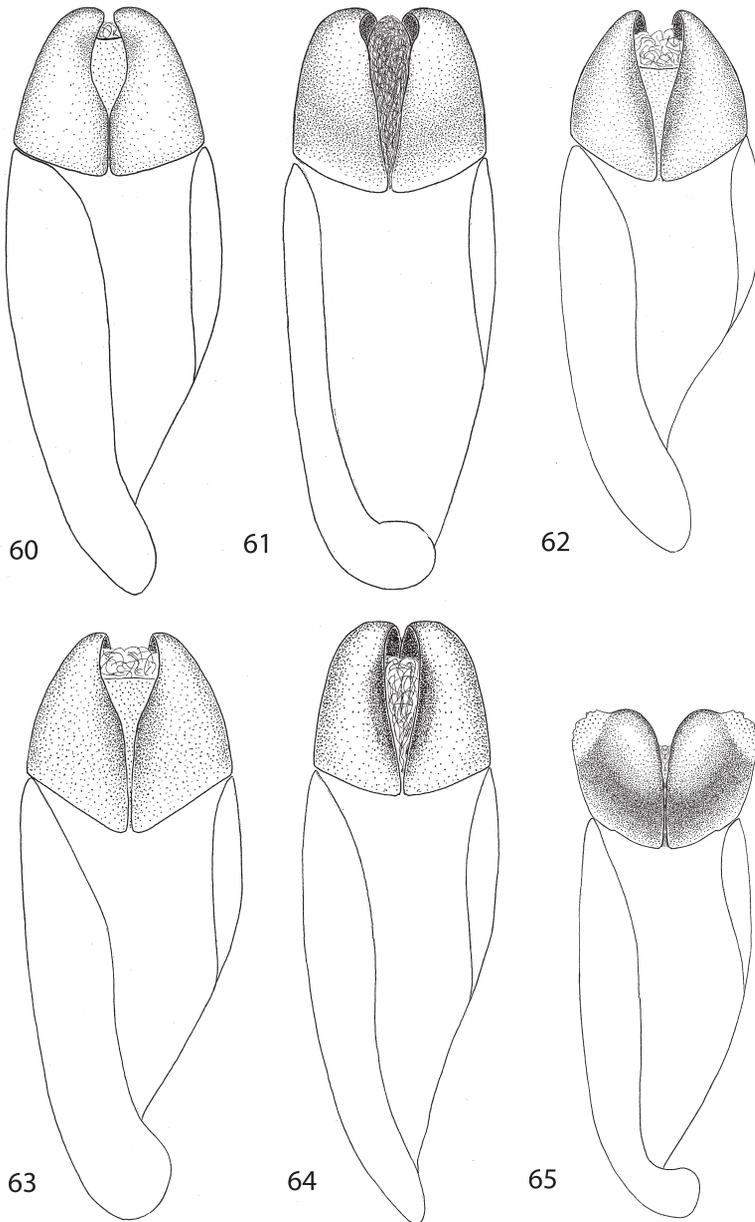

Measurements. Total body length 10.5–12.2 mm (lectotype, ♂: 11.5 mm; paralectotype No. 1, ♀: 12.0 mm).

Differential diagnosis. Refer to species key.

Collection circumstances. Prefers sandy soils.

Distribution. Algeria (with no locality specified), northernmost Tunisia and Sicily (Italy) (Fig. 59).

Remarks. ABEILLE DE PERRIN (1898) described *Bolboceras vaulozeri* based on a series of male and female specimens ('plusieurs sujets') from Bizerte (Tunisia). He did not establish a holotype; thus in this study, we here designate a lectotype (♂) (Fig. 55) and seven paralectotypes for fixation of this taxon (Fig. 56). BOUCOMONT (1902: 6) listed this species as valid, while BOUCOMONT (1912: 17) as a synonym to *Bolbelasmus bocchus*. PIC (1924) disagreed with BOUCOMONT (1902)

Figs 60–65. Aedeagus of *Bolbelasmus* species, ventral aspect, schematically. 60 – *B. bocchus* (Erichson, 1841), 61 – *B. brancoi* Hillert & Král sp. nov., 62 – *B. gallicus* (Mulsant, 1842), 63 – *B. howdeni* Hillert & Král sp. nov., 64 – *B. nikolajevi* Hillert, Arnone, Král & Massa sp. nov., 65 – *B. vaulogeri* (Abeille de Perrin, 1898).

and considered that the character given to differentiate *B. vaulogeri* (horn bifid vs. simple horn) was not valid: ‘(à corne simple) avec *bocchus* Er. (à corne entaillée) ♂, inscrite au Catalogus 46, ne me parait pas justifiée’. KRIKKEN (1977) studied a series of ten males and six females from Tunisia (from Biserta, Hammamet, Maktar and Sousse, however, no types were included), and resurrected the taxon as a subspecies of *B. bocchus*. BRANCO (2005) believes Krikken was mistaken as ABELLE DE PERRIN (1898) gave a body size of 5 mm for *B. vaulogeri*. However, the description by ABELLE DE PERRIN (1898) certainly refers to a *Bolbelasmus*, the type series exists, and males are 7.5–9.5 mm long; thus the name *B. vaulogeri* is available, but the measure recorded by ABELLE DE PERRIN (1898) was just smaller than the actual ones.

Concerning the status in Sicily, the story is intricate. RAGUSA (1893) was the first entomologist to collect a species of *Bolbelasmus* in Sicily. He sent the specimen, a female, to E. Reitter, who tentatively identified it as *Bolboceras gallicus*, and wrote on a label that a study of the male was needed to confirm his identification (ARNONE & MASSA 2010). When Ragusa obtained a male, he was convinced that it belonged to *B. gallicus* and decided to publish the record without re-consulting with Reitter. Thus, this species was reported in different catalogues, without checking the specimens preserved in the Ragusa collection. In 1974, B. Massa collected another male on the sandy coast of Balestrate (Palermo), finding that characters of the scutellar shield and the head pattern did not match with the characteristics of *B. gallicus*. That specimen was examined and identified by Jacques Baraud as *B. unicornis* (BARAUD 1977). Since 1974, a few specimens of *Bolbelasmus* were found (cf. ALIQUÒ 1988, who recorded it as *B. gallicus*; AGOGLITTA et al. 2006, who identified two specimens as *B. unicornis*). In 2009–2010, it was possible to have access to some males and females to compare them with the two species previously reported from Sicily and the other known species in the Mediterranean area; thus, ARNONE & MASSA (2010) described it as *Bolbelasmus romanorum*, following KRIKKEN (1977) in considering *B. vaulogeri* a species related to *B. bocchus*.

Altogether, for a very long time the taxonomic status of the species *B. vaulogeri* was confused and the taxonomic status changed many times. Remarkably, no one possesses the type material examined in the description of 1898 for the taxonomic status to be clarified. The fact that this species is with simple tubercle on frons and not bifurcate ‘...corne frontale du ♂ en forme de tubercule conique émoussé, très courte...’ was not considered by all authors.

Thus, we examined the series of specimens of *B. romanorum* and compared them with *B. vaulogeri* and are now able to establish the following synonymy: *Bolbelasmus romanorum* Arnone & Massa, 2010, syn. nov. = *Bolbelasmus vaulogeri* (Abeille de Perrin, 1898).

Identification key for well and medium developed males

- 1 (10) Scutellar shield impunctate or indistinctly shallowly punctate, frontal horn simple or furcate apically.
- 2 (5) Frontal horn simple; genae evenly rounded; oblique keel above eyes over whole eyes length; head strongly constricted behind eyes.
- 3 (4) Frontal horn directed forwards and upwards in lateral view; clypeus with short transversal carina; scutellar shield triangular, approximately as long as wide; body

- surface brownish, maximal body length 14 mm. Southern parts of Central Europe, Alsace, Italy, Balkan Peninsula, Poland, Russia and Ukraine.
 *B. unicornis* (Schrank von Paula, 1789)
- 4 (3) Frontal horn bending not forwards (Figs 19–20); transversal clypeal carina absent; scutellar shield triangular longer than wide; body surface blackish, maximal body length 13 mm (Figs 6–7, 38); aedeagus as in Fig. 65; Algeria, Italy (Sicily) and Tunisia (Fig. 59). *B. vaulozeri* (Abeille de Perrin, 1898)
- 5 (2) Frontal horn furcate apically; genae more or less angulate anterolaterally; oblique keel above eyes reaching only to anterior part of eyes; head not strongly constricted behind eyes.
- 6 (7) Frontal horn short and not longer than broad, horn apex approximately as wide as horn base (Figs 2, 15, 22); pronotal punctation denser with exception of basal part, punctures separated approximately by distance equal to their diameters; pronotal base with distinct visible but fine, regularly pinned points; elytral striae well impressed, visible as complete lines; elytral intervals moderately convex; aedeagus as in Fig. 61; Spain (Fig. 59). *B. brancoi* Hillert & Král **sp. nov.**
- 7 (6) Frontal horn long, longer than broad, horn becoming gradually thinner from base to apex (Figs 1, 5, 14, 18, 21, 25, 27, 31, 33, 37, 57); pronotal punctation sparser, punctures separated by approximately three times their diameters; pronotal base with very fine, weakly visible and well separated pinned points; elytral striae not impressed, visible as row of punctures; elytral intervals flat; northern Africa.
- 8 (9) Base of frontal horn situated at level of anterior part of eyes; horn sharply keeled from base to half of its length in dorsal aspect (Figs 1, 14, 21, 27, 33); medial hornlike apophysis of pronotum directed vertically upwards in lateral aspect, subapical protrusion situated basally; lateral hornlike apophyses of pronotum directed forwards and weakly divergent; aedeagus as in Fig. 60; Algeria and Morocco (Fig. 59). *B. bocchus* (Erichson, 1841)
- 9 (8) Base of frontal horn situated at level of posterior part of eyes; horn broadly keeled from base to apex in dorsal view (Figs 5, 18, 25, 31, 37, 57); medial hornlike apophysis of pronotum directed obliquely forwards in lateral aspect, subapical protrusion situated near apex; lateral hornlike apophyses of pronotum directed forwards; aedeagus as in Fig 64; Egypt, Libya and Tunisia (Fig. 59).
 *B. nikolajevi* Hillert, Arnone, Král & Massa **sp. nov.**
- 10 (1) Scutellar shield densely punctate; frontal horn simple apically.
- 11 (12) Apex of frontal horn approximately as wide as horn base, apex broadly acute-angled, strongly flattened on front part of apex (Figs 3, 16, 23, 29, 35); aedeagus as in Fig. 62; France (including Corsica), Portugal and Spain (Fig. 59).
 *B. gallicus* (Mulsant, 1842)
- 12 (11) Apex of frontal horn becoming gradually thinner from base to apex, apex acute-angled, only weakly flattened on front part of apex (Figs 4, 17, 24, 30, 36); aedeagus as in Fig. 63; Spain, Gibraltar (Fig. 59). *B. howdeni* Hillert & Král **sp. nov.**

Identification key for less developed males

- 1 (10) Scutellar shield impunctate or weakly shallowly punctate, frontal horn simple or furcate apically.
- 2 (5) Frontal horn simple; genae regularly rounded; oblique keel above eyes extending over whole eyes length; head strongly constricted behind eyes.
- 3 (4) Scutellar shield triangular, approximately as long as wide; body surface brownish, maximal body length 12 mm. Southern parts of Central Europe, Alsace, Italy, Balkan Peninsula, Poland, Russia and Ukraine. ***B. unicornis*** (Schrank von Paula, 1789)
- 4 (3) Scutellar shield triangular, longer than wide; body surface blackish, maximal body length 11 mm; aedeagus as in Fig. 65; Algeria, Italy (Sicily) and Tunisia (Fig. 59).
..... ***B. vaulozeri*** (Abeille de Perrin, 1898)
- 5 (2) Frontal horn furcate apically; genae more or less angulate anterolaterally; oblique keel above eyes reaching only to anterior part of eyes; head not strongly constricted behind eyes.
- 6 (7) Pronotal punctation denser with exception of basal part, punctures separated approximately by distance equal to their diameters; pronotal base with distinct visible but fine, regularly spaced pinned points, elytral striae well impressed, visible as complete lines; elytral intervals moderately convex; aedeagus as in Fig. 61; Spain (Fig. 59). ***B. brancoi*** Hillert & Král **sp. nov.**
- 7 (6) Pronotal punctation sparser, punctures separated by approximately three times their diameters pronotal base with very fine, weakly visible and well separated pinned points; elytral striae not impressed, visible as row of punctures; elytral intervals flat; northern Africa.
- 8 (9) Base of frontal horn situated at level of anterior part of eyes; horn sharply keeled basally only; aedeagus as in Fig. 60; Algeria and Morocco (Fig. 59).
..... ***B. bocchus*** (Erichson, 1841)
- 9 (8) Base of frontal horn situated at level of posterior part of eyes; horn broadly keeled from base to apex in dorsal view; aedeagus as in Fig. 64; Egypt, Libya and Tunisia (Fig. 59). ***B. nikolajevi*** Hillert, Arnone, Král & Massa **sp. nov.**
- 10 (1) Scutellar shield densely punctate; frontal horn simple apically.
- 11 (12) Apex of frontal horn flattened on front part of apex; aedeagus as in Fig 62; France (including Corsica), Portugal and Spain (Fig. 59). ***B. gallicus*** (Mulsant, 1842)
- 12 (11) Apex of frontal horn regularly arcuate, not flattened on front part of apex; aedeagus as in Fig. 63; Spain, Gibraltar (Fig. 59). ***B. howdeni*** Hillert & Král **sp. nov.**

Identification key for females

- 1 (10) Scutellar shield impunctate, or weakly shallowly punctate.
- 2 (5) Frontal tubercle simple (Figs 41, 42, 44); genae regularly rounded; oblique keel above eyes over whole length of eyes; head strongly constricted behind eyes.

- 3 (4) Scutellar shield triangular, approximately as long as wide; body surface brownish, minimal body length 12 mm. Southern parts of Central Europe, Alsace, Italy, Balkan Peninsula, Poland, Russia and Ukraine. *B. unicornis* (Schrank von Paula, 1789)
- 4 (3) Scutellar shield triangular longer than wide; body surface blackish, minimal body length 11 mm (Fig 13); Algeria, Italy (Sicily) and Tunisia (Fig. 59).
..... *B. vaulozeri* (Abeille de Perrin, 1898)
- 5 (2) Frontal tubercle furcate apically (Figs 39–40, 43); genae more or less angulate anterolaterally; oblique keel above eyes reaching only to anterior part of eyes; head not strongly constricted behind eyes.
- 6 (7) Pronotal punctation denser with exception of basal part, punctures separated approximately by distance equal to their diameters; pronotal base with distinct visible but fine, regularly pinned points; elytral striae well impressed, visible as complete lines; elytral intervals moderately convex (Fig. 9); Spain (Fig. 59).
..... *B. brancoi* Hillert & Král **sp. nov.**
- 7 (6) Pronotal punctation sparser, punctures separated by approximately three times their diameters pronotal base with very fine weak visible and well separated pinned points; elytral striae not impressed, visible as row of punctures; elytral intervals flat; northern Africa.
- 8 (9) Base of frontal tubercle situated at level of anterior part of eyes; tubercle sharply keeled basally only in dorsal view (Fig. 8); Algeria and Morocco (Fig. 59).
..... *B. bocchus* (Erichson, 1841)
- 9 (8) Base of frontal tubercle situated at level of posterior part of eyes; horn broadly keeled from base to apex in dorsal view (Fig. 12); Egypt, Libya and Tunisia (Fig. 59).
..... *B. nikolajevi* Hillert, Arnone, Král & Massa **sp. nov.**
- 10 (1) Scutellar shield densely punctate.
- 11 (12) France (including Corse), Portugal and Spain (see distribution map on Fig. 59 for details). *B. gallicus* (Mulsant, 1842)
- 12 (11) Spain, Gibraltar (see distribution map on Fig. 59, for details).
..... *B. howdeni* Hillert & Král **sp. nov.**

Annotated list of the Western Palaearctic *Bolbelasmus* species with new records

Bolbelasmus bocchus (Erichson, 1841)

Bolbeceras Bocchus Erichson, 1841: 170 (original description).

= *Bolbeceras fissicornis* Mulsant, 1843: 280 (original description). Synonymized by MARSEUL (1857: 83).

Type localities. *Bolbeceras Bocchus*: ‘Algier [Bona = Annaba]’; *B. fissicornis*: ‘Algérie’.

Distribution. Algeria, Morocco (present paper).

Bolbelasmus brancoi Hillert & Král **sp. nov.**

Type locality. Spain (Andalusia), Los Jesus, N slope of Sierra de Alhamilla, 37°05'N 02°17'W, 500 m a.s.l.

Distribution. Spain.

***Bolbelasmus gallicus* (Mulsant, 1842)**

Bolboceras Gallicus Mulsant, 1842: 350 (original description).

= *Bolboceras Gallicus* Var. *Conjunctus* Mulsant, 1842: 351 (original description). Synonymized by BOUCOMONT (1912: 17).

= *Bolboceras Gallicus* Var. *Provincialis* Mulsant, 1842: 351 (original description). Synonymized by BOUCOMONT (1912: 17).

Type localities. *Bolboceras gallicus*: France, ‘exclusivement méridionale; Draguignan, Saint-Tropez, environs de Marseille’; *B. conjunctus*: ‘France méridionale’; *B. provincialis*: ‘France méridionale’.

Distribution. France (including Corsica – first records), Portugal, Spain (present paper).

***Bolbelasmus howdeni* Hillert & Král sp. nov.**

Type locality. Spain, Andalusia, Castillo de Castillar, Algeciras env., 10 km N of San Roque, 36°12'N 05°23'W, 78 m a.s.l.

Distribution. Spain, Gibraltar (present paper).

***Bolbelasmus keithi* Miessen & Trichas, 2011**

Bolbelasmus keithi Miessen & Trichas, 2011: 183 (original description), figs on pp. 187–188 [not numbered].

Type locality. Greece, ‘env. Ag. Paraskevi (church), Agia Marina, Kasos island, (Lat: 35°24'10.71"N, Long: 26°54'27.59"E)’.

Type material examined (2 specimens). PARATYPES: GREECE: CRETE: 1 ♂ 1 ♀, ‘ELAFONISI (Life), 30/12/96-14/3/97, Leg. Trichas 321 [white printed label], Elafonisi (Life), = Elafonisos, S.-O. Kriti, 30.XII.→ 14.III.1997, leg.: A. Trichas 321, collection: G. Miessen det. 2011, PARATYPUS [printed, red label]’ (GMCL).

Additional material examined (9 specimens). GREECE: CRETE: Plakias, 1.iv.1988, 1 ♀, Winkelmann-Köck lgt. (LHCB), 1 ♀ (OHCB); Kastellakia [= Kastellos], 35°22'N, 24°29'E, 4.iv.1978, at light, 1 ♂, Malicky lgt. (DKCP); Mirabella, 1 ♂ Maltzan [?lgt.] (OHCB). RHODES: Falirakion, Ladiko, 22.iv.–5.v.1990, 2 ♂♂ 1 ♀, L. Egger lgt. (ABCB) and (MECI); Villanova, 7.ii.1934, 1 ♂ (MSNM); Marizza, 13.i.1934, 1 ♂ (MSAP).

Remarks. After the description of *B. keithi* from Crete and Kasos Islands by MIESSEN & TRICHAS (2011), the record of *B. unicornis* from Rhodes by SCHATZMAYR (1936) and MIKŠIĆ (1959) needed to be confirmed. Actually, following MIESSEN & TRICHAS (2011), we identified the Rhodes specimens as *B. keithi*, thus definitively excluding the presence of *B. unicornis* in the Mediterranean islands (see also ARNONE & MASSA 2010, MIESSEN 2011, MIESSEN & TRICHAS 2011). Therefore the above mentioned specimens constitute the first record of *B. keithi* from the island of Rhodes.

Distribution. Greece: Crete, Kasos and Rhodes (MIESSEN & TRICHAS 2011).

***Bolbelasmus makrisi* Miessen, 2011**

Bolbelasmus makrisi Miessen, 2011: 111 (original description), figs on pp. 116, 118–119 [not numbered].

Type locality. ‘Kourion, Lemesos, alt.: 50 m, Cyprus’.

Type material examined (2 specimens). PARATYPES: CYPRUS: 1 ♂ 1 ♀, ‘Rizoelia nat. for. Park, Larnaka – CYP-RUS, leg.: E. Kakouris, collection: G. Miessen, *Bolbelasmus makrisi* nov. sp., G. Miessen det. 2011, PARATYPUS [printed, red label]’ (GMCL).

Additional material examined (64 specimens). CYPRUS: PAPHOS: Akamas NP, 5 km N of Lara, 13.–20.iii.2015, 1 ♂ 1 ♀, O. Hillert lgt. (OHCB); Akamas NP, Lara, 13.–20.iii.2015, 1 ♂, O. Hillert lgt. (OHCB); Miliou, N of

Paphos, 13.–20.iii.2015, 1 ♂, O. Hillert lgt. (OHCB); Miliou, 34°56'22.23"N, 32°27'35.90"E, vivant dans piscine [alive in pool], 7.vi.2014, 1 ♂, G. Miessen lgt. (OHCB); Miliou, 34°56'21.66"N 32°27'35.59"E, attiré par lampe UV [attracted by UV light], 7.vi.2014, 1 ♀, G. Miessen lgt. (OHCB); 5 km NE of Pegeia, Paphos env., 13.–20.iii.2015, 16 ♂♂ 15 ♀♀, O. Hillert lgt. (OHCB), 1 ♂ 1 ♀ (ERCS), 1 ♂ 1 ♀ (HKCS), 2 ♂♂ 1 ♀ (JSCP), 2 ♂♂ 2 ♀♀ (DKCP), 4 ♂♂ 2 ♀♀ (OBCB), 2 ♂♂ 2 ♀♀ (GMCL), 3 ♂♂ 3 ♀♀ (BMCP).

Distribution. Cyprus (MIESSEN 2011).

***Bolbelasmus nikolajevi* Hillert, Arnone, Král & Massa sp. nov.**

Type locality. NW Tunisia, Sidi Bouzid gov., 7.5 km SWW of Hajeb el Ayoun, by road, 35°22'N, 09°28'E, 340 m a.s.l.

Distribution. Egypt, Libya and Tunisia (present paper).

***Bolbelasmus nireus* (Reitter, 1895)**

Bolboceras nireus Reitter, 1895: 81 (original description).

Type locality. Turkey, 'Akbes' [= Maydān Akbis].

Material examined (6 specimens). **TURKEY:** ADANA PROV.: Adana, 1 ♂, 1 ♀ (JMCP); İçel, Çamlıyayla, Sebil, 24.–26.v.1995, 1 ♀, J. Mička lgt. (JMCP). **ANTALYA PROV.:** Korkuteli, 11.vi.1991, 1 ♀, B. Němec lgt. (BNCP); Side, 27.iv.1973, 1 ♂, K. Warncke lgt. (OHCB). **IRAN:** FARS PROV.: pass 140 km NE Šīraāz, 20.–21.iv.2002, 1 ♂, S. Kadlec lgt. (NMPC).

Distribution. Iraq, Iran, Syria, Turkey (KRIKKEN 1977, KEITH 2005, KRÁL et al. 2006, ARNONE & MASSA 2010, MIESSEN 2011).

***Bolbelasmus unicornis* (Schrank von Paula, 1789)**

Scarabaeus unicornis Schrank von Paula, 1789: 61 (original description).

= *Scarabaeus aeneas* Panzer, 1793: pl. 5 (original illustration).

= *Scarabaeus quadridens* Panzer, 1795: 2 (original description), figs 1–4.

Type localities. *Scarabaeus aeneas*: Germany, 'Bavariae'; *S. quadridens*: 'Austriae, Bavariae'; *S. unicornis*: Austria, 'Aus der Sammlung des Hrn. Rathes Schiffermüller'.

Material examined (85 specimens). **AUSTRIA:** Austria, 2 ♂♂ 1 ♀ (MSNG); Oesterreich, 1 ♂ (OHCB); Österr.[eich], 1 ♂ (ZFMK). **WIEN:** Umg. Wien, 1 ♀, Ad. Hoffmann [lgt.] (ZFMK). **BOSNIA & HERZEGOVINA:** Herzegovina, 1 ♂ (ZFMK). **CZECH REPUBLIC:** MORAVIA: Čejč, 'Manson's steppe', 16.vi.1995, 1 ♂, Vít Kubáň lgt. (VKCB); 2 km SE of Čejč, 'Manson steppe', 29.vi.1999, 1 ♀, Vít Kubáň lgt. (VKCB); Prossnitz [= Prostějov], 1 ♂, K. Kyselý lgt. (NHMB). **HUNGARY:** Hungaria, 1 ♂ 2 ♀♀ (NMPC). **PEST:** Budapest Hármashatár-hegy, autos hálózás 31.v.2004, 1 ♂, O. Merkl lgt. (HNHM); Budapest, Martonhegy 17.iii.1949, 1 ♂ (HNHM); Isaszeg, 19.i.2008, 1 ♀ (HNHM); Keszthely, 47°43'N, 18°47'E, 17.x.2014, 1 ♀, Tomáš Vendl lgt. (TVCP); Pest, 1 ♀ (NMEC); Csévharaszt 14-16.viii.2001, 1 ♂, Szél lgt. (HNHM); Bátorbagy, 27.vi.99, 1 ♂, G. András lgt. (HNHM); Budakeszi Hosszú-dűlő, 200 m, Cynodonto-Festucetum, on *Glomus macrocarpum*, 8.vi.1991, 1 ♀, L. Ádám lgt. (HNHM). **SOMOGY:** Kaposvár 8.vii.1931, 1 ♂, M. Nattán lgt. (HNHM); Kaposvár, 1 ♀, M. Nattán lgt. (HNHM). **TOLNA:** Bábaapáti Nagy-Mórágyi-völgy Ezüsthársas-tolgyes, 1 ♀ (HNHM). **GERMANY:** BAYERN: Bavaria, 1 ♂, ex. coll. Veselý (NMPC). **ITALY:** **PIEDMONT:** Piemont, 1 ♂ (NMPC); Piedmont, 1 ♂, Baudi [lgt.] (MZUF); Piedmont, 1 ♂, L. Carrara [lgt.] (MZUF); Piedmont, 4 ♂♂ 2 ♀♀ (MSNG). **LOMBARDY:** Milan 1 ♂ 1 ♀ (MSNG). **TUSCANY:** Toscana, 1 ♀ (OHCB). **ROMANIA:** **TULCEA:** Babadag, 11.vii.1985, 1 ♂, Jaromír Hanuš lgt. (VKCB). **SÁLAJ:** Z. [Zaláu], erdő [forest], 3.viii.1973, 1 ♀ (OHCB). **SERBIA:** Serbia, 1 ♂, coll. Matcha (NMPC). **VOJVODINA:** Ruma, 1 ♂ (MSNG); **ŠUMADIJA:** Đerdap, 5 km WSW of Tekija, 27.–28.v.2014, 2 ♂♂ 1 ♀ (DKCP). **SLOVAKIA:** **BANSKÁ BYSTRICA REG.:** Banská Bystrica, 18.v.1979, 1 ♂ (VKCC); Kiarov, vi.1936, 1 ♀, Dr. R. Schwarz lgt. (NMPC). **KOŠTICE REG.:** Hrhov, E of Okružle hill, 4.vii.1988, 2 ♂♂, David Král lgt. (DKCP); Silická planina [plateau], Rakača env., 5.vii.1988, 1 ♀, David Král lgt. (DKCP); **NITRA REG.:** Kamenica nad Hronom, Čierna hora [hill], 11.viii.2011, 1 ♂, D. Juřena lgt. (BMCP). **PREŠOV**

REG.: Snina, vii.1965, 1 ♂, M. Sláma lgt. (DKCP); **TRENČÍN REG.:** Brunovce, 1 ♀ (NMEC); Trenčín, Zlatovce, 27.vi.1935, 1 ♀ (NMPC); Trenčín, v.[19]31, 1 ♀, Dr. A. Richter (NMPC); Trenčín, Zlatovce, vi.[19]26, 1 ♀, Čepelák lgt. (NMPC); Trenčín, 2 ♂♂ 3 ♀♀, Čepelák lgt. (DKCP), 9 ♂♂ 8 ♀♀ (NMPC), 2 ♂♂ 1 ♀ (OHCB); Trenčín, 1 ♂ 1 ♀ (NMPC); Trenčín, 1 ♀, V. Steidl lgt. (NMPC); Trenčín, 1 ♂ 1 ♀, Dr. A. Richter lgt. (NMPC); Trenčín. Inovec, 1 ♂, Čepelák lgt. (NMPC); Trenczsen, 1 ♂ 1 ♀ (OHCB). **TRNAVA REG.:** Hlohovec, 1 ♀, Varkonyi [lgt.] (DKCP); Pustá Ves, 22.vii.1984, 1 ♀, Máslo lgt. (NMPC). **TURKEY (European):** EDİRNE PROV.: ca. 15 km east of Edirne, 27.iii.[19]88, 1 ♀, Heinz lgt. (DKCP). **(Asian):** DENİZLİ PROV.: Anatolien, Goundely [= Denizli], v. [19]56, 1 ♂, Kulzer lgt. (ZSMC). **UKRAINE:** CHERNIHIV PROV.: Bukowina, Chernowitz, 1 ♀ (NMPC).

Remarks. *Bolbelasmus unicornis* has so far been reported from France and Italy, across southern parts of Central Europe to the Balkan Peninsula, Ukraine and southern parts of European Russia (cf. e.g. ÁDÁM 1994, 2003; ALLENSPACH 1970; BALLERIO et al. 2010; BARAUD 1977, 1992; BUNALSKI et al. 2013; ENDRÖDI 1957; HORION 1958, GUÉORGUIEV & BUNALSKI 2004; JUŘENA et al. 2008; KÖHLER & KLAUSNITZER 1998; KRÁL & MALÝ 1993; MIKŠIĆ 1970; LUMARET 1990; NÁDAI 2006; PAILL 2008; PETROVITZ 1956; SHOKHIN 2007). It has also been recorded from Crete and Rhodes, but actually these islands are inhabited by *B. makrisi* (see above) (SCHATZAMAYR 1936, PETROVITZ 1959, MIESSEN 2011, MIESSEN & TRICHAS 2011, present paper). Italian records of *B. unicornis* cover Piedmont, Lombardy, Trentino, Tuscany, Veneto and Friuli (BALLERIO 2008, BENASSO 1971, ZANDIGIACOMO 2006, present data). The presence in Sicily, first reported by BARAUD (1977), has to be referred to *B. vaulogeri* (present study). First record from the Tuscany province of Italy.

Distribution. Austria, Bosnia & Herzegovina, Bulgaria, Croatia, Czech Republic, France (Alsace), Germany, Greece, Hungary, Italy, Moldavia, Poland, Romania, Russia, Serbia, Slovakia, Slovenia, Switzerland, Turkey (European and Asian) and Ukraine (KRÁL et al. 2006, present data).

Bolbelasmus tauricus Petrovitz, 1973

Bolbelasmus tauricus Petrovitz, 1973: 338 (original description).

Type locality. Turkey, ‘Cilicischer Taurus, Südhang, Namrun’.

Distribution. Turkey (Asian) (KRÁL et al. 2006, ARNONE & MASSA 2010, MIESSEN 2011).

Bolbelasmus vaulogeri (Abeille de Perrin, 1898) stat. restit.

Bolboceras Vaulogeri Abeille de Perrin, 1898: 254 (original description).

= *Bolbelasmus romanorum* Arnone & Massa, 2010: 403, figs 1–5, 8 (original description), **syn. nov.**

Type localities. *Bolboceras Vaulogeri*: Tunisia, ‘Bizerte’; *Bolbelasmus romanorum*: Italy, ‘Sicily, Balestrate, foce Calatubo (Palermo)’.

Distribution. Algeria, Italy (Sicily), Tunisia (present paper).

Acknowledgements

We thank all colleagues and institutions listed in the Material and methods section for enabling us to study the material in their care. Radek Dunda (Újezd u Chcebuži, CZ), Harald Kalz (Schlabendorf, GE), Jan Schneider (Praha, CZ), Petr Šípek and Dominik Vondráček (both Charles University in Prague, CZ) and Jan Vondráček (Bulhary, CZ) were excellent

companions of OH and DK during their collecting trips to Portugal, Morocco, Spain and Tunisia. Special thanks are due to Denis Keith (Chartres, France) for his help with identification of some localities, Marcello Romano for executing several photographs included in this paper, Petr Šípek for allowing us to use the photos of living specimens and Marc Miquel (Queen Mary University of London, UK) for editing our English text. David Král would like to acknowledge the institutional support from resources of the Ministry of Education, Youth and Sports of the Czech Republic.
